BRITANNICA BOOK OF THE YEAR

(Trade Mark Reg. U.S. Pat. Off.)

IN THIS VOLUME, in addition to bibliographies of books and periodicals, references are made to films which cover the subjects of many articles. In all instances the films referred to are 16-mm. sound motion pictures which were produced in 1950. So these references, in addition to giving the reader information about further visual study he can pursue on these subjects, provide a record of most of the major 16-mm. films produced during the year.

There are thousands of 16-mm. films, and perhaps the most comprehensive source of titles and subjects is the *Educational Film Guide* published by the H. W. Wilson Company, New York, N.Y.

These 16-mm. films may be obtained from many film rental libraries maintained throughout the United States by state universities, by many public libraries and by commercial visual-education dealers. The Film Council of America with headquarters in Chicago, Ill., and its community Film Councils can usually provide information about how to obtain the films. Many public libraries can also give this information. Should these sources fail to help in securing a desired film, the reader should write directly to the producer.

*The editor of the BRITANNICA BOOK OF THE YEAR acknowledges with gratitude the privilege of using 35 pictures from LIFE. Acknowledgments of the copyright ownership of all illustrations may be found on the following three pages.* THE EDITOR

# INTRODUCTION

---

**T**HE *Encyclopædia Britannica* company was purchased by two Americans in May 1901, and thereupon began a historic half century of publishing enterprise and innovation which has distributed ten times as many volumes as were distributed during the previous 133 years of Britannica's long history. But the American publishers have done more than that to extend the resources and services of Britannica.

In 1913 the first Britannica annual was issued. It was called *Britannica Year-Book*, created to do the same work as the present *Britannica Book of the Year*. But World War I intervened and the depressions which followed discouraged further publication. In 1933 *The World Today*, a magazine-bulletin, appeared at intervals for five issues and continued to appear five times a year until June 1937. The following year the first *Britannica Book of the Year* was issued, and has been published annually since.

The book you hold in your hand is the fourteenth of the series and its publication in 1951 marks the beginning of the 50th anniversary of American ownership of the 183-year-old *Encyclopædia Britannica*.

From 1768 this publication has been, by common consent, the most useful and most comprehensive encyclopædia in the English language. Its extensive, international distribution since 1901 has made possible the continuous annual revision by classification of the *Encyclopædia*, the publication of *Britannica Junior* (1934), a fifteen-volume encyclopædia designed especially for boys and girls, *The World Atlas* (1943), the purpose of which, by carefully designed innovations, is to help peoples everywhere understand how all nationalities live and govern themselves, and *Ten Eventful Years* (1947), a four-volume reflection of the World War II years.

The usefulness of *Encyclopædia Britannica* itself has expanded with the development of the Library Research Service (1936), available to owners who pose some 34,000 questions of fact to be answered each year, and by publication of the *Britannica Book of the Year*, to keep the reader abreast of the times.

The present anniversary year marks the closing of the first half century of American ownership during which millions and millions of Britannica books have been distributed throughout the world and points to the beginning of a new half century of continued effort to combat, in a small way, the evil of ignorance and to help to achieve that era of understanding and peace toward which a troubled world slowly moves.

WALTER YUST

# EDITORS AND CONTRIBUTORS

WALTER YUST, EDITOR OF ENCYCLOPÆDIA BRITANNICA  
AND OF THE BRITANNICA BOOK OF THE YEAR

HOWARD E. KASCH, *Associate Editor of the Book of the Year*

RUTH SOFFER, *Picture Editor*

(Initials and names of contributors to the Britannica Book of the Year with the principal articles written by them. The arrangement is alphabetical by initials.)

- A.A.P.** Greece (in part)  
ALEXANDER A. PALLIS. Minister Plenipotentiary attached to the Greek Embassy; Director of the Greek Office of Information, London, Eng. Author of *Greece's Anatolian Venture—and After*; etc.
- A.B.Bu.** Mississippi  
ALFRED B. BUTTS. Technical Civilian Educational Adviser, Office of the Adjutant General, U.S. Army. Author of *Public Administration in Mississippi*.
- Ab.W.** Public Health Engineering  
ABEL WOLMAN. Professor of Sanitary Engineering, The Johns Hopkins University, Baltimore, Md.
- A.C.Ch.** X-Ray and Radiology  
ARTHUR C. CHRISTIE, M.D. Chief, Department of Radiology, Doctors Hospital Medical Center, Washington, D.C.
- A.Ck.** English Literature (in part)  
ARTHUR CROOK. Literary Critic, London, Eng.
- A.Da.** Football (in part)  
ALLISON DANZIG. Member of Sports Staff, *The New York Times*, New York, N.Y. Author of *The Racquet Game*; etc.
- A.Dr.** Textile Industry (in part)  
ALFRED DAWBER. Editor, *Textile Manufacturer*, Manchester, Eng.
- A.E.St.** Illinois  
ADLAI E. STEVENSON. Governor of Illinois.
- A.Flo.** Spanish-American Literature  
ANGEL FLORES. Chairman of Latin American Area Studies and Professor of Latin American Literature, Queens College, Flushing, N.Y.
- A.G.Br.** Dyestuffs (in part)  
ANSCO G. BRUINIER, JR. Technical Advertising Manager, Dyestuffs Division, Organic Chemicals Department, E. I. du Pont de Nemours & Company, Inc., Wilmington, Del.
- A.G.Cr.** Wyoming  
A. G. CRANE. Governor of Wyoming, 1949-51.
- A.G.L.I.** Hospitals (in part)  
A. G. L. IVES. Secretary, King Edward's Hospital Fund for London, London, Eng. Author of *British Hospitals*.
- A.G.Ne.** Munitions of War (in part)  
A. G. NOBLE. Rear Admiral, U.S.N. Chief of the Bureau of Ordnance, Department of the Navy, Washington, D.C.
- A.G.S.** Insurance (in part)  
ANTONE G. SINGSEN. Assistant Director, Blue Cross Commission, American Hospital Association; Assistant Secretary-Treasurer, Health Service, Inc.
- A.H.J.B.** Canals and Inland Waterways (in part)  
ALFRED HENRY JAMES BOWN. General Manager and Clerk, River Wear Commissioners, Sunderland, Eng.
- A.H.Ld.** Forests (in part)  
ARTHUR HENRY LLOYD. Lecturer in Forestry, Oxford University, Oxford, Eng.
- A.H.Md.** Betting and Gambling (in part); etc.  
ALBERT H. MOREHEAD. Editor, *The Official Rules of Card Games*. Bridge Editor, *The New York Times*. Author of *The Modern Hoyle*; etc.
- A.J.A.** Social Security (in part)  
A. J. ALTMAYER. Commissioner, Social Security Administration, Federal Security Agency, Washington, D.C.
- A.J.Ar.** Industrial Health (in part)

# Nineteen Fifty

## A Survey of Politico-Cultural Trends of the Year

---

BY ISAIAH BERLIN

*Fellow of All Souls College, Oxford University,  
and University Lecturer in Philosophy*

### I

The year 1950 was culturally undistinguished and politically troubled. It was disturbed by disorders in 16 countries<sup>1</sup>, involved in acute border disputes in 6 crucial areas<sup>2</sup>, and was without the compensation of even the thin but steady stream of human achievement in the sciences, the arts, and ideas which had marked the previous year. Moreover, it was overshadowed by a peril of far greater magnitude—the fear, suddenly grown concrete, of the outbreak of a new world war less than five years after the end of the last great cataclysm.

The nuclear physicist, Leo Szillard, calculated that within 10 to 15 years all human life on the earth might be extinguished by hydrogen bombs. This kind of speculation, the effect of which in previous years was to induce feelings, not only of anxiety but also of guilt, on the part of those who considered themselves responsible—in the first place physicists and politicians—now provoked a desire for self-preservation, if need be by resistance to possible enemies—a combination of terror and resolution, rather than further self-examination or self-condemnation.

The event for which the year 1950 was likely to be most vividly remembered was the outbreak of war in Korea on June 25, when for the first time, the two great systems, which between them divided the civilized world, finally met in open conflict. This was merely a formal climax of the most crucial development of our times; but the tension between the Communist and non-Communist parts of the world mounted with particular rapidity, with symptoms which were observable in every region of human experience.

It was not an unconscious process. The fact that the 20th century had reached its midmost point stimulated much self-conscious reflection about the path which mankind had traversed since its early years. Obvious comparisons were made, in almost every country which

possessed a free press, with the relatively deep peace in which the century seemed to open and even more with that now almost fabulous time—the years of the middle 19th century in the European continent. It was an occasion for many sardonic analogies between the overflowing optimism and pride of the 1850s and our own time, with its sad prophecies about the human future, reflecting the disenchantment which unceasing material progress with its apparently inevitable accompaniment of uncontrollable chaos and destruction, had brought to the west.

These melancholy summaries no longer possessed that note of tranquil sadness, tinged with gently nostalgic feeling, which permeated both life and letters in quieter times. The previous year, 1949, so far as literature, for example, was concerned, to some degree took refuge in “escapist” reminiscences of the solid security of Victorianism and earlier periods. By 1950 the danger, not merely of war, but of total atomization of peaceful populations by the newly discovered weapons of unheard of destructive power, had come too close to permit of even the limited comfort of pleasant daydreams of this kind. The desire to avoid facing the painful facts, which had been responsible for the partial return, in western Europe at any rate, to purely “aesthetic” poetry and painting, to imaginative writing preoccupied by the problems of private life, to mordant but light social satire, to memoirs and biographies in which fastidious elegance and a desire to please was more evident than deep moral or political concern—this general trend, while it overflowed to some degree into 1950, was no longer characteristic of that year. The mild, sober, pensive mood of the post-World War II years began to give way to the anxiety and at times acute depression of what seemed a new prewar (rather than postwar) period; while there was no discernible hysteria in the countries of the west, they appeared to be permeated by a kind of grim expectation of a new *débâcle*; this feeling was not fatalistic, disaster might still be averted, there was no reason for resignation or despair. Nevertheless, the daily news given by the press and radio acquired a new and menacing urgency, and this was duly reflected in literature and the arts as well as the more obvious social and political manifestations of these months.

The output of books reflecting this preoccupation increased noticeably; the confessions of disillusioned ex-

<sup>1</sup> Bolivia, Eritrea, France, Greece, Gold Coast, Indochina, Indonesia, Ivory Coast, Guatemala, Kashmir, Malaya, Nepal, Iran (Persia), Puerto Rico, the Philippines, South Africa.

<sup>2</sup> Berlin, China, Cominform—Tito (Yugoslavia), Jerusalem, Trieste, Saar.

Communists (of which the most notable was the collection of essays by many hands entitled *The God That Failed*) no longer served merely to entertain or excite a public avid for sensational revelations or hair-raising "inside stories" as such—but directly affected readers to whom the energetic conspirators from whose midst came these eloquent "renegades" still appeared as a very real and immediate menace. James Burnham, Arthur Koestler, Ignazio Silone, Louis Fischer and Douglas Hyde were no longer merely repentant sinners or subjects of thrilling psychological autobiographies, but respected experts and daily guides to action. The *Kulturkampf* began in real earnest, with great embitterment on both sides and no quarter given.

Politically, the most important single aspect of this was the reluctant but for the most part final recognition by the majority of the thinking inhabitants of western Europe and the Americas (although not of Asia or Africa) that there were in fact two worlds; that the differences in the political spectrum were not graduated but broke sharply at the frontier marked by the so-called "iron curtain"; that however deeply men of liberal convictions might abhor the cruelties and injustices of the semicapitalist system under which they lived, there was more that was common to them and their moderate right wing opponents than between them and the rulers of Communist Russia and the police democracies. The destruction of the old "Popular Front" solidarity of all left wing groups against embattled reaction was a very painful disillusionment to large sections of progressive opinion. But this process, begun by Andrei Vishinsky's brutally direct speeches before various forums of the United Nations, and continued by other soviet spokesmen and brought home by the suppression of civil liberties in one Communist state after the other, did finally begin to achieve the result of isolating Communists as a *sui generis* totalitarian group with ideals in absolute conflict with those of liberals and democrats of every shade and hue, a conflict no less violent and irreconcilable than that with fascists or ultramontane Catholics.

It was in this atmosphere that the western powers were enabled to make a serious effort to achieve the limited objectives of the Atlantic pact—a move at self-defense from possible soviet aggression; and arrangements for making possible a united military and economic strategy (which later in the year led to the appointment of Gen. Dwight D. Eisenhower as commander in chief of the united western European forces) obtained a degree of general support in the west scarcely possible a year or two before, when such steps would have been denounced vehemently by a good many persons and bodies in no political sympathy with communism. Every western country now feared armed aggression and intervention by members of the soviet bloc and there was less liability to illusion (although it was by no means wholly absent) either about the consequences of this, or

about the possibility of remaining neutral and untouched.

The Communists, on their side, were plainly not unaware of the shift in opinion; they realized the consequent disadvantage to the Soviet Union, and took appropriate steps. They intensified production, particularly of war material, in the sovietized part of the world and took increasingly drastic steps to insulate their populations even more hermetically by continuing the violent campaigns against foreigners and foreign civilizations, and by reducing contacts with them to the level of the Muscovy of Ivan the Terrible. At the same time it became plain to them that propaganda about the immense achievements of soviet culture was no longer proving as effective in the west as it had been, and, indeed, tended to cover its agents with ridicule; consequently, strictly political and cultural issues were played down, and a universal appeal was made for peace. Hundreds of thousands of signatures, mainly in central and eastern Europe, were obtained for a document drafted at Stockholm, which carefully omitted controversial political issues and concentrated upon the world-wide yearning to avoid another war. The "Stockholm Peace Petition" was much the most successful piece of propaganda achieved by the Soviet Union for many months, and to some degree offset the painful effect caused by its particularly harsh recent persecution of all intellectuals and artists who saw any good in any aspect of western civilization, as well as by its openly aggressive policies in Asia. The most prominent countermove to this Communist campaign was made by the Roman Catholic Church, which by giving great publicity to the Holy Year and to the ensuing pilgrimage to Rome, further attracted attention with the promulgation by the pope of the new dogma of the Bodily Assumption of the Virgin.

. . .

Thus 1950 was a year in which the general stiffening of the fronts had begun. The Roman Church formally denounced not merely association with communism in any form, but other intellectual heresies as well, such as idealism, pragmatism, existentialism, etc., which had begun to creep into the fold in spurious disguises. A major battle had begun. In the United States anti-Communist feeling had reached a new height. A bill had passed both houses of congress requiring Communists and "fellow travellers" to register themselves with the newly set up agency for counteracting subversive activities, and a new immigration law (passed over the president's veto) was enacted whereby anyone who belonged, or had ever belonged to a totalitarian community, whether of the left or the right, whether past or present, found it difficult, if not impossible, to enter the United States. The sense of present danger was increased not merely by the disturbing news of the growth of Communist power, particularly in Asia, but by such local events as the celebrated trial of Alger Hiss (who had been condemned for perjury in denying that he had, 12 years before, given

confidential government documents to a soviet spy) which culminated in his sentence to a term of imprisonment. This was accompanied and followed by the trials and convictions of lesser figures for similar offenses, in particular of scientists, some of whom by their own admissions had given to the Soviet Union secrets connected with atomic research. Of these the case of Klaus Fuchs, engaged upon secret work of this kind in England, who made a full confession, was perhaps the most notorious; not long after this an Italian physicist, Bruno Pontecorvo, disappeared under mysterious circumstances, it was supposed to the Soviet Union.

The notion that Communist parties abroad were in effect not political organizations so much as networks of espionage began to be established in the public mind. In this atmosphere a group of U.S. politicians led by Sen. Joseph R. McCarthy declared that United States government agencies, and in particular the state department, were riddled with Communists and their sympathizers who acted as foreign agents and spies. In particular they maintained that many homosexuals, who were open for this reason to blackmail by soviet agents, infested U.S. government departments and were a source of grave weakness to them. Senator McCarthy and his friends demanded a thorough-going purge of such persons. Departmental inquiries were duly held, followed by some dismissals, but this did not satisfy the accusers. Dean Acheson, the U.S. secretary of state, was attacked for conducting a vacillating foreign policy which discouraged such natural allies of the United States as Generalissimo Chiang Kai-shek and Gen. Francisco Franco and gave heart to their left wing opponents. Acheson's dismissal began to be steadily demanded. Pres. Harry S. Truman defended his secretary of state. The Tydings committee cleared the accused state department of most of the charges flung at its members. But the charge of Communist permeation had made a very deep impression upon the public imagination of the U.S., as shown by the defeat, later in the year, of many members of the U.S. congress suspected of insufficient anti-Communist zeal.

The passions aroused by this drive against communism, spread very widely. Persons of liberal views, untainted by communism, began to feel themselves affected by the political storm. Several universities demanded oaths of loyalty from their teaching staffs which some of these were not prepared to give. The issue of academic freedom became critical. A further spate of books and articles by ex-Communists and "nonreturning" refugees from the Soviet Union heightened this mood, and a holy war against communism in the United States, which felt it had most to lose by the advance of communism, was plainly in process of beginning, and might well number among its victims many innocent liberals and unpolitical persons, as well as Communist sympathizers. This phenomenon also occurred, but on a far smaller scale, in western Europe. The pursuit of security grew to be a major public concern and the discovery of

hitherto undetected friends of the Soviet Union in positions of responsibility in various countries of western Europe upset opinion in the United States more than it did in those countries themselves. Thus the dismissal of the celebrated Communist physicist Frédéric Joliot-Curie from his supervision of French nuclear research shook but did not cause an upheaval in French public opinion. Repercussions of this campaign occurred in Australia and South Africa in which bills to outlaw the Communist party were promulgated; South Africa pushed on with its policy of segregating its nonwhite natives in a world atmosphere less unfavourable to it than at the moment of liberal enthusiasm which followed the victory over fascism. In short, the question of one's attitude to the U.S.S.R. and communism became the central social and personal issue of the time. The Soviet Union was ranged against the United States, each ringed by its allies and dependencies, and the principal preoccupation of many western Europeans was how to avoid being crushed in the collision of the great giants, against both of whom a rising resentment began to be felt. The *Kulturkampf* between the two worlds had reached a stage which made other issues, and attempts at synthesis between the rival systems of ideas, of which there was a good deal of talk in the years immediately following the end of World War II, begin to seem both irrelevant and futile.

This had several interesting and important consequences. In the countries which had been defeated by the Germans five years before, preoccupation with the danger of total destruction to some degree took precedence over older political beliefs and principles. Catholics and Communists were protected by their faith and guarded their sacred heritage; but the vast intermediate bloc of opinion, from unreflecting conservatives to left wing non-Communist radicals, asked themselves not so much what it was they believed, what principles they were ready to defend, but the more pragmatic question—from which side the attack would come first and how it was to be averted. This practical problem of life and death, which the experiences of the very recent war of extinction had rendered particularly real, made the older theoretical issues, such as secularism versus clericalism, collectivism versus individualism, political versus economic action, etc., seem somewhat academic and obsolete. One of the alternatives to becoming obsessed with immediate perils was to concentrate one's attention upon remoter fields. The success of the existentialist philosophy in lands which had been ruled by fascists was certainly in part due to the fact that, by dealing in an impressively obscure metaphysical terminology, it served as so often before to relieve, e.g., many Germans, of the painful need to contemplate their own past crimes and errors by sublimating the issue into a dark and lofty region where nothing was any longer sufficiently connected with daily life to stir remorse or indignation or human feeling applicable to the events of daily life. The French, with a philosophical and literary tradition less

capable of generating this kind of spiritual smoke screen, contrived to turn this mood into a literature which, in the works of M. Sartre, Mlle. Beauvoir, M. Camus and others, continued to create a very talented, imaginative metaphysico-psychological fiction thereby avoiding the sharp issues of the mounting crisis. This bifurcation—on the one hand the elimination of political philosophies and principles by an urgent preoccupation with the spectacle of approaching doom accompanied by a search for the means to avoid it, and, on the other, elevation or immersion into a sphere above or below the terrors of daily life—did not develop in American, British or Scandinavian countries to a similar extent, perhaps because it was the result of harrowing moral experiences and a scepticism born of unbearable humiliation to which these countries had not had to submit.

In England, and to a large extent in the Netherlands and Scandinavia also, public opinion became increasingly anxious about the approaching possibility of war between the giants; sections of opinion, both left and right wing, still nursed the hope of being able to remain neutral, albeit with diminishing confidence. The United States—the symbol of an active attitude to the coming struggle for power—at times became almost as great an irritant to British Conservatives as to adherents of the Labour party which continued to be in power. The root of this attitude lay, not merely in the natural resentments which painful stabilization at a level of lesser influence and power must naturally induce among previously dominant nations and continents, but in the feeling, familiar enough to Americans (since it was an ingredient of American isolationism both of the right and the left in the two decades before Pearl Harbor) of wishing to be left to solve their own sufficiently acute social and economic problems without being drawn into a lethal war by powers too strong to resist, too hard to influence, and yet impossible to ignore or offend, inasmuch as one of them at any rate was the source of indispensable financial and economic aid. And yet in spite of much angry criticism in the socialist and liberal press of western Europe and the British dominions of what was considered heavy-handed or blundering American diplomacy in Europe, or ignorance and bigotry on the part of influential circles of American opinion, a clear majority of the groups and individuals which form western European opinion, felt the United States to be their indispensable protector against the designs of the expansionist Soviet Union. The situation was, indeed, in some respects not unlike the state of U.S. opinion in the late 1930s: the number of Americans who were in those days positively profascist was very small, although distrust and disapproval of Europe was very widespread; there was disdainful talk of “rival imperialisms” from whose degrading struggle the new world should steer clear; but even then it was obvious that as against Hitler and Mussolini, U.S. opinion was solidly on the side of the democracies. So now, western European opinion, resentfully,

distrustfully and uneasily, ranged itself on the side of Washington and against Moscow, although the pro-Moscow minorities were relatively larger, more indignant, although perhaps no more influential, and held their ground more steadily than profascist groups in the United States ten years before.

Certainly the Communists did not increase in influence during the year: in England and northern Europe they remained negligible. The case of Britain was instructive. In the British general election, which returned the British Labour party to precarious power with a minute majority of six, the Communist representation of two was wiped out altogether; and bitter though controversies over such measures as steel nationalization, and the tempo of rearmament, at times became in the British houses of parliament, the attitude to the U.S.S.R. played relatively little part therein. On the major issues of foreign policy both the Conservative and the Labour parties were in tacit agreement, and when events made the British government's rearmament plans seem ludicrously inadequate, the government no less than the opposition accepted this fact without a struggle, and so, what in fact in all but name was a “bipartisan” foreign and defense policy, remained singularly undisturbed, despite the temptation which a tiny government majority would have presented to a morally less responsible opposition at a less perilous moment.

In France and Italy communism and its sympathizers offered a far greater danger, yet even there the Communist party made no headway. The somewhat right wing cabinets of France of Bidault and Plevin (with a very short interlude by Henri Queuille), and the De Gasperi government in Italy, successfully stemmed the left wing tide. The “Stockholm Peace Petition” had made some impression. The French C.G.T. unions remained under Communist influence, and so did corresponding trade unions in Italy and Belgium, and these from time to time staged spectacular strikes; but the net result of this was not significant. Despite such traditionally demoralizing factors as bitter disputes about wages and taxes, about electoral reform and Catholic schools, despite the attempts by Communists to start disorders by attacks on the conservative newspaper *Figaro*, and the campaign to build up the Communist leader Thorez into a national champion of patriotic democracy—a kind of Gambetta or Jaurès—the fearless enemy of the cosmopolitan conspiracy of bankers and warmongers, French political life did not go through a major crisis. Some Polish Communists were expelled and relations with Poland and the Soviet Union deteriorated. There was a violent campaign against Jules Moch, who had been an exceptionally active minister of the interior and of defense, and was attacked from both right and left, being accused by the left of brutal suppression of political liberties, and by the right of opposing German rearmament to the detriment of France and western defense; but this assault from which both Communists and Gaullists seemed to

expect much, finally petered out. The constructive imagination of France manifested itself in the so-called Schuman plan, largely inspired by Jean Monnet, for the integration of iron and steel production in Europe under a supernational authority. In the controversy with Britain that ensued, France appeared to be speaking for Europe more truly than any other great nation. But this was the official voice of France; there were no echoes of it in French art or literature, still absorbed, save for the Communists, with personal themes.

Even in Belgium, where a major succession crisis shook the country, stability was preserved. The very large and bitterly hostile minority opposed to King Leopold's return (which included left wing parties, liberals, trade unionists, etc.,) nearly caused a civil war. Disturbances occurred; there were violent deaths; a Communist leader was assassinated. Finally a compromise was adopted by the acceptance of King Leopold's son, Prince Baudouin, as king. Thus even in Belgium, communism was in 1950 not a serious internal danger, and the same was true of most of the countries of western Europe.

Yugoslavia, under Tito, continued as a heretical outpost against orthodox communism, thereby incidentally providing an outlet for the loyalty of those left wing intellectuals in western Europe who most of all abhor capitalism and even the kind of socialism which compromises with it, and would like to come to terms with, but cannot quite bring themselves to swear absolute obedience to, the despotic demands of undiluted soviet communism. Spain and Portugal continued under their dictatorships; Greece, with the Communists crushed, consolidated its economic position, Switzerland continued to be solidly Conservative while Germany and Austria remained battlegrounds between the ideologies modified by local religious and nationalistic traditions. The United States saw itself (as indeed it was) in the role of a financial patron and saviour, engaged in shoring up the rickety European structure against an otherwise unavoidable collapse, and showed some resentment against isolationist or "neutralist" attitudes on the part of countries which only it had saved from being gobbled by the soviet crocodile, and who now appeared to be venting their ill temper upon their largely disinterested rescuer. Consequently, there was much talk in the United States of inability to help those who showed no desire to help themselves, and of a limit to the feasibility of defending those obstinately labouring under separatist delusions. Unless Europe gave some concrete sign of federating itself into a political and economic unit, capable at any rate of some degree of serious self-defense, its military future looked to United States-observers very gloomy; the various international organizations seemed disappointingly unable to create a single political and economic texture, and Britain, with its Scandinavian followers, looked like the ringleader in the prevention of a European union on U.S. lines, because, so it was held, Britain was dominated by a selfish fear of losing its world position which depended on its extra-Euro-

pean connections. On the other hand, it was allowed that Attlee's government, despite its minute majority, showed a remarkable capacity for survival; parliament behaved with a commendable sense of responsibility; on major issues of foreign policy it seemed largely undivided, and the angry taunts occasioned by Sir Stafford Cripps' devaluation of the pound were silenced by the solid fruits of this audacious step. Sir Stafford Cripps retired, leaving Britain in a financial position stronger than that during the previous year. In the autumn the British government took the spectacular step of declaring itself no longer in need of Marshall aid, and yet this nation insisted on displaying an apparent lack of solidarity with its neighbours in western Europe. It looked for all the world as if French and Italians, the Benelux countries and others, were ready enough to form a union, but for sabotage by the British Labour government, which had shown itself no less isolationist and empire-minded than its Conservative predecessors. Winston Churchill lent his great authority to such a view and demanded a greater degree of European integration; spokesmen of the British government declared that the lowering of economic standards of living with a sudden reversal of British economy by "integrating" itself into the complementary continental economy, even to the limited extent proposed by the Schuman plan with control no longer vested in democratically elected parliaments, could hardly strengthen western Europe or the free world. Their opponents replied that this was mere defense of the obsolete, and now obstructive concept, of national sovereignty against wider forms of association, posing as a demand for democratic control.

The middle eastern countries, preoccupied with the internal social problems arising from the semif feudal systems under which they live, filled with bitter hostility toward the new state of Israel, and nursing resentful memories of the defeat of their armies, and of lack of concrete sympathy from the western Allies, took up a stiffly neutral position vis-à-vis the east-west conflict, pronouncing themselves anti-Communist indeed, but in favour of a more cautious and independent policy of no alliances with the great powers to avoid fresh disillusionments. India and Pakistan, themselves in the grip of a ruinous conflict, with war between them narrowly averted and a fierce dispute about the territory of Kashmir, displayed an equal neutrality. Turkey proved the freedom of its institutions by the result of elections in which Kemal Atatürk's successor had been defeated and was peacefully succeeded by the leader of the opposition; neither party concealed its fear of the U.S.S.R. and both were unequivocally on the side of the west. Iran (Persia), which alone held the distinction of having successfully frustrated soviet plans by purely diplomatic means, continued to tread a cautious and tortuous path. China, under a victorious Communist government, violently denounced American aid to the defeated nationalists now driven to the island of Formosa. The French were pursuing a none too successful war against the left

wing Viêt-Nam party in Indochina, supported Emperor Bao Dai, and complained of insufficient help from the United States in the campaign. The new Indonesian republic finally stabilized its relations with the Dutch on a solid basis and was granted admission to the ranks of the United Nations. . . .

The assumption that all the new republics with seats in the assembly of the United Nations lived in the same century was not entirely justified: on April 2 the government of the Burmese republic, in the midst of a civil war against its Karen rebels, suddenly resigned; official astrologers were ceremoniously consulted, and, five minutes later, the government resumed its office. In Malaya left wing terrorism continued, as in the case of Indochina with Chinese Communist aid. Thailand was nervous but relatively peaceful under its new king. In Korea the soviet-supported government of the north and the U.S.-supported government of the south glared at each other balefully across the artificial dividing line of the 38th parallel. This was the situation until June, when the North Korean government invaded South Korean territory, using the age-old formula that they had received intelligence that the South Koreans were on the point of launching a major attack upon them. On June 26, the day after the North Koreans crossed the 38th parallel—a term destined to become unforgettable by endless reiteration—President Truman, with the approval of the majority of the Security council of the United Nations, offered air and naval aid to the attacked South Korean government, and a few days later, after the Security council had formally called upon all its members to aid it in repelling the aggressor, the United States, Great Britain, the non-Asiatic British dominions and other members of the United Nations, sent reinforcements to support the South Koreans in their war.

. . .

There is no need to trace here the vicissitudes of this war: after the initial reverses by the forces of the United Nations at the hands of the North Koreans, widely held to be armed and trained by the Soviet Union, the invaders were repelled and driven back by General MacArthur's forces (of which much the greater part was supplied by the United States) after a successful landing in their rear; the United Nations forces drove across the 38th parallel and to certain points on the Manchurian border, where, in November, they unexpectedly met a large Chinese army which in its turn drove the United Nations forces across the peninsula, so that by the end of the year they were arrayed near the 38th parallel, awaiting further attack. This was the first serious armed conflict between a state supported by the Soviet Union and its satellites, and a state supported by other members of the United Nations. The possibility of world war seemed suddenly greatly increased, and under its shadow the lines were still more tightly drawn. Various agencies of the United Nations, while expressing their abhor-

rence of the act of aggression, unsuccessfully attempted to end immediate hostilities by an armistice or a cease-fire order.

For a period American opinion achieved greater unity than at any time since the end of World War II; for a time the violent personal attacks upon the department of state and U.S. foreign policy ceased to occupy the forefront of attention. Pres. Truman's bold act in sending military aid to Korea was acclaimed as truly representing the will of the American people. That curious combination of isolationism, acute right wing nationalism and conservatism in domestic affairs, linked with a passionate emphasis on far eastern in preference to European involvement, which had characterized the isolationist camp during World War II, for once seemed to melt, and its leaders to approach more closely to the outlook of the internationalist leaders of the Democratic administration and the state department. Even the pre-occupation with the Communist Trojan horse took second place to the consciousness of international responsibility, of the United States as the leader of the free nations against totalitarian aggression. But the "mid-term" elections proved that the activities of Senator McCarthy and his allies had nevertheless borne fruit; a number of liberal senators and congressmen were defeated, "rock-ribbed" Republicans were elected by increased majorities, the inquisitors of the state department and the U.S. administration generally were returned in great force, and although the revered figure of General Marshall soon entered the cabinet to replace the somewhat discredited Louis Johnson, violent onslaughts on policies common to him and Acheson continued unabated. In Europe the Korean war produced at first admiring approval, on the part of the majority, of the U.S. president's attempt to back words with deeds and demonstrate that the United Nations could defend its interests by force as well as argument. But after the initial North Korean advance continued, reaction set in. It took the form of protests against what was conceived as an unnecessary war, particularly when this was represented as being due to the intemperate policies of the great non-European powers who neither understood nor cared for the survival of western Europe and its values. Opinion presently crystallized round the views expressed by Churchill (whom no one could accuse of prosoviet tendencies or anti-American feeling or inclination to undue pessimism) when he told the house of commons that the Asiatic war was a diversion from the main issue, which lay in Europe—a trap into which major western powers must not allow themselves to be drawn. This seemed only too clearly to be also the opinion of the Labour cabinet, and Attlee's swift resolve to visit Washington, D.C., acclaimed in France and elsewhere as a move likely to sober alleged American extremism, emphasized this as a general European attitude, which in its turn provoked American charges of European cowardice and ingratitude. Presently certain Asiatic powers together with Arab states, who looked upon themselves

as a neutral third force in this conflict, offered their mediation. Their proposal was rejected by the soviet bloc, to whom the whole situation may well have looked uncommonly like a repetition of western intervention in Russia in 1918, with Chiang Kai-shek as a kind of Chinese Denikin or Kolchak, and the United Nations as an angry but in the end insufficiently resolute entente, bent on intervention against a nation in arms, but, as always, with inadequate forces.

In this dark atmosphere quarrels and recriminations between the western Allies naturally grew in frequency and bitterness. Britain maintained that if its advice had initially been followed by the U.S., and the Chinese Communist government recognized by the United Nations at the beginning of the year, Chinese intervention in Korea and possibly even its invasion of Tibet (which astonished and dismayed the socialist Indian prime minister, Nehru) might not have occurred. American statesmen maintained that if they had earlier been allowed to rearm the Germans, there would now have been in Europe a far more solid obstacle to Russian aggression. The French declared that to allow the Germans a large army was the most fatal of all moves—the recreation of the reichswehr with its sinister memories of the Rapallo agreement followed by General Seeckt's secret and successful rearming of the Germans after 1918, and finally the Russo-German pact of 1939; it was surely better to let the Germans enter a European army as individuals rather than as units. The western Germans, meanwhile, were divided into those who did not wish to bear the brunt of war again under any circumstances, and rejected rearmament as a prelude to being turned into cannon fodder for the western powers, and those like Adenauer, the chancellor, who for reasons of national pride refused rearmament unless the establishment of some kind of independent German military establishment were authorized.

The year closed with only a very partial compromise upon these questions, with a wide divergence of views in America and Europe as to the need to fight a full-scale Asiatic war, and in the midst of military setbacks and a prospect of a dark future. Nevertheless, the basic alliance of the western powers remained intact and the appointment of General Eisenhower as supreme commander of the forces of the Atlantic powers in Europe was, as was noted above, symbolic of a degree of unity scarcely imaginable a few years before.

. . .

Meanwhile the life of the peoples under soviet influence remained opaque to western eyes. So far as one could tell, the Soviet Union itself was absorbed in the pursuit of its postwar plan to achieve greatly increased production, at the expense of progress in the arts of peace, of both guns and butter. To the accompaniment of the (by now normal) punishments for inefficiency and sabotage on the part of those engaged in production, great economic progress was reported in the soviet press.

In the sphere of culture the acute chauvinism of the previous year was kept up, indeed intensified, and foreign influences still more rigidly excluded; apart from an exiguous but valuable stream of purely academic literary scholarship engaged in restoring the texts and publishing hitherto unknown fragments of the works of the authors admitted into the soviet canon, nothing of general significance, or even notoriety, came from the Soviet Union in 1950, apart from a sudden and, as it seemed to the outside world, bizarre pronouncement by Stalin himself, in which he publicly condemned the views of academician Marr, hitherto a sacrosanct soviet authority on linguistics, who had put forward views of increasing eccentricity until his death in 1934, which had made him and his followers the laughingstock of scholars in other countries. Stalin explained in a newspaper article that language did not necessarily alter as a direct function of the change in the class structure of society, but obeyed slower laws. This was the first pronouncement for many years on a theoretical topic by the high priest of Communist orthodoxy. As such it was not merely accepted with the routine universal adulation by all Communist scholars, but gave hope that the violent drive against artists and authors accused of insufficient Marxist orthodoxy might now be somewhat relaxed, at any rate in regions relatively free from politics—that, in fact, they might share in the blessings of the linguists so suddenly and gratifyingly freed from their heaviest theoretical fetters.

In the satellite countries the process of eliminating "fellow travellers" and "soft" Communists from key positions continued, and the primary duty of each country was rammed home to each and all of them. In Poland an obviously precarious and short-lived arrangement was arrived at with a certain representative of the Roman Church whereby Catholic worship was to be tolerated on terms duly denounced as not being acceptable to the Vatican. The violent abuse of, and threats against Tito and his heretical regime continued unabated, but the major weapons in this war of words were naturally reserved for the United States. The attack used in the course of propaganda to, and within, the western countries was two-pronged; in each case it attributed to the United States policies of which the Soviet Union was itself most frequently and plausibly accused. It stressed the desirability of peace, endangered solely by American imperialist greed, but also it appealed openly to the national traditions of each country, and to its longing to remain free and independent, and true to its own national traditions, as opposed to exploitation and destruction as so much raw material for the ruthless American war machine. The English were duly reminded that they were the land of Shakespeare, Milton, Dickens, and not the degenerate tools of the bankers of Wall street. The French were invited to reflect on the past glories and the revolutionary tradition of the republic, and on the ancient friendship between France and Russia and France's traditional hostility to England.

Herbert Hoover's call to his country to return to old-fashioned isolationism and to abandon the European continent to its own devices—if need be to perish as the victim of its own ridiculous ineptitude—was given an almost approving prominence in the soviet press. Ever stricter Stalin worship was demanded from the satellite press and public. The last remaining nonpolitical poets and artists in satellite countries had pressure put upon them to pay homage to Stalin as the champion of humanity and peace. The United States was represented as the symbol at once of war and of a vulgar and materialistic cosmopolitanism seeking to destroy Europe, the cradle of civilization, morally, intellectually and physically, an image made familiar originally by nazi propaganda, and at various times applied by it both to the United States and to the U.S.S.R. and then, in turn used to describe Germany itself by soviet publicists in the period of friction before the soviet-nazi friendship pact of 1939.

## II

So far as the arts and letters and thought are concerned, 1950 was a remarkably undistinguished year. If we compare 1950 with the corresponding year after World War I, the contrast is even more depressing. 1923 was a year when such writers as Joseph Conrad, George Moore, H. G. Wells and Bernard Shaw were still full of creative power; D. H. Lawrence, Virginia Woolf, Sinclair Lewis, André Gide, Arnold Bennett and W. B. Yeats were at the height of their powers. Aldous Huxley, Edith Sitwell, Jean Cocteau, François Mauriac, Ernest Hemingway, T. S. Eliot and other exceptionally gifted writers were beginning to arouse attention. If it be said that men of genius and even of striking talent are seldom noticed by their contemporaries and loom much larger in retrospect than at the time of their emergence, and that consequently many a genius may today be writing or painting or composing and not be visible as yet to the average critical eye, it may be answered that the attitude toward the arts had greatly changed in a quarter of a century. In those far off days the unorthodox and unconventional was often sharply condemned by the average respected critic, and sharp controversies were common round figures whom their followers claimed as men of genius, while their opponents denounced them as charlatans or the false idols of ephemeral coteries. Since then, so poor does the world seem to have grown in literary and artistic giants, that the critics, so far from disparaging the unfamiliar or the disconcerting, seemed only too much on the alert to catch the faintest symptom of anything remotely suggestive of truly original talent. The danger now is not that men of gifts may be ignored or unjustly treated, but that the commonplace or the counterfeit may be overpraised by those who, in their terror of missing a masterpiece for lack of sensibility or perception see a swan in every goose. The public can no longer, at any rate in Europe, be shocked into protest; even the most philis-

tine assume that genius may be concealed in the incomprehensible. The capacity for sharp reaction, whether favourable or hostile, has grown very weak; the atmosphere is becalmed; eyes and ears are acutely strained to catch the faintest glimpse, the faintest whisper of something interesting or unusual, and yet there is little enough that the most generous and comprehensive fisher of talent can catch in his net. Among English-speaking writers, Evelyn Waugh's phantasy about Saint Helena continued in his unique but by now familiar strain. Henry Green, Joyce Cary, William Sansom, Jocelyn Brooke, Liam O'Flaherty, Angus Wilson and Rose Macaulay added to the literature of imagination, but did not extend its boundaries in any dimension. In France M. Klossowski, André Dhôtel and M. Perain were new authors who wrote novels of distinction, but scarcely made a literary summer; Jean Giono and Julian Green added small jewels to the crowns secure upon their heads; Arthur Waley added yet another to his series of exquisite translations from Chinese; in Germany Hans Jahn wrote a work of fiction worthy of serious comment. Nor was the situation very different in the field of criticism. Lord Russell, G. M. Young, Aldous Huxley, Graham Hough, Edward Sackville West, Martin Turnell, Sir Maurice Bowra, Julian Benda, Rex Warner and Herbert Read produced essays of genuine distinction, but no new reputations were created, no well-established reputations were strikingly enhanced, no unfamiliar territory was discovered. There was much solid historical research, both in England and in the United States. Henry S. Commager and Allan Nevins produced valuable historical surveys, Professor Neale and Mr. Rowse made original contributions to knowledge of the Elizabethan age. Professor Feiling wrote a distinguished *History of England*. Professor Braudel produced a remarkable work on French mediaeval history and the Mediterranean, Professor Altamira's classical history of Spain was translated, and Menéndez Pidal's masterpiece on Spanish aesthetics may also now be read in English; E. R. Curtius put a lifetime of scholarship and thought into his book on the Latin tradition in mediaeval European literature. Magistral editions of Theocritus by A. S. Gow, and of the Agamemnon by E. Fraenkel were contributed by the universities of Cambridge and Oxford to the great storehouse of English learning. Msgr. Knox wrote a notable study of *Enthusiasm*—the emotional and spiritual deviations from the centre on the part of religious figures and preachers. The splendid edition of Ben Jonson, edited now by Percy Simpson alone, drew nearer to its close. C. G. Coulton's monumental and authoritative treatise on mediaeval monasticism achieved its posthumous culmination. John Hersey celebrated the heroic resistance of the Warsaw ghetto to its nazi executioners in *The Wall*, a work of greater humanitarian and historical than literary merit. Professors Renier, Halecki and Niebuhr wrote thoughtful works on the nature of history and its practice. Charles Morazé pursued his bold and original reinter-

pretation of recent history in terms of demographical and economic categories. A noble monument by Father Dvornik on the making of central and eastern Europe made its unobtrusive appearance. Several elegant biographies appeared of a now familiar type, of which the most informative was that of the Victorian worthy, Monckton Milnes, by James Pope Hennessy. This was followed by several studies of the 18th century with publication of hitherto unfamiliar private papers of which the most sensational was the lately discovered London journal of James Boswell. The life of Florence Nightingale by Miss Woodham Smith captured the public imagination. Bernard Berenson summed up a lifetime of critical experience in *Aesthetics and History*. Sir Osbert Sitwell added a charming pendant to his autobiography. Freya Stark, Wyndham Lewis, Sir Arthur Keith, Geoffrey Grigson, Mrs. Franklin Roosevelt and Benedetto Croce wrote their reminiscences. Richard Aldington wrote the life of D. H. Lawrence, and Louis Fischer a ponderous work on Gandhi. But these looked back to an older world. The public was reminded of the great distance which the world has travelled by the deaths of such great pillars of a civilization, now oddly remote, as Bernard Shaw, Gen. Jan Christiaan Smuts, Léon Blum, Henry Stimson, the composer Richard Strauss, the dancer Nijinsky and the actor Emil Jannings. Even the world of those who died at an age less ripe—the gifted, gay and versatile dilettante Lord Berners, the notable socialist Professor Harold Laski, Sinclair Lewis who invented a famous literary genre—seemed cut off from contemporary life, and to belong to an almost golden age of audacious new directions which turned out to lead to reputable but hardly startling goals. Only George Orwell, the most incorruptible of all modern writers, who died in the beginning of the year, was thoroughly contemporary in the feeling and content of his remarkable satires and essays. His writings have made a genuinely deep impression on the younger British and American intellectuals, and his influence, both literary and political, in large part, perhaps, because of the moral severity and rigid integrity of his personal life seems likely to have a lasting effect.

Meanwhile Agar, J. F. Dulles and Stringfellow Barr brought the lessons of history to bear upon the issues of our day in a large style, and based on presuppositions, which in western Europe seemed no longer to be accepted.

The poetry written during the year was neither better nor worse than that of other years, but on the whole less memorable; among the old masters Walter de la Mare, Ezra Pound and M. Supervielle published volumes of verse. Among the newer poets, Barker, Gascoigne, Montale and Ungaretti made some mark. But the most acclaimed works of this period were both works of poetic drama: T. S. Eliot's *The Cocktail Party* and Christopher Fry's *The Lady's Not For Burning* and other plays. The first achieved great popular success on

both sides of the ocean. It offered little new light upon Eliot's outlook but it was widely recognized as an ingenious and impressive translation of his social and religious principles into the medium of drama. As for Fry, his verbal felicity was conceded by the sternest critics to be of an uncommon order but he opened no new window, created no arresting new genre; nevertheless upon so flat and unimpressive a scene it was a performance of scintillating virtuosity, and sprang from a thin but genuine vein of talent.

. . .

In the world of music much was written that was both agreeable and competent; apart from the performance of the posthumous works of Bartók, and the latest works of such established masters as Hindemith and Vaughan Williams, nothing appeared to mark the year; Stravinsky, Prokofiev, Poulenc, even Benjamin Britten remained relatively silent. In place of creative music there was a notable rise in the standards of performance and of critical interest. The growth of love for serious music among sections of society hitherto contented with musical banalities, or jazz, or nothing at all, was truly arresting. The exceptional number of musical festivals in Europe alone testified to the fact that a more widespread interest in music was probably taken at this moment than at any previous period in history. The festivals of Salzburg, Lucerne, Aix-en-Provence, Siena, Perugia, Venice, Besançon, Edinburgh, Glyndebourne (and, in the U.S., of Tanglewood, Mass.) and above all the Prades festival, organized round the violoncellist Pablo Casals, by far the greatest instrumental player of his age, and dedicated to the memory of J. S. Bach who died 200 years ago—as well as many less known, but no less devoted musical celebrations—provided a great enrichment to the world of pure art. The year was marred by the death of the Rumanian pianist Dinu Lipatti who, still in his twenties, was a lyrical genius of the first order.

. . .

The great creative impetus which produced the remarkable Italian films of previous years seemed to be not indeed exhausted, but running at a lower ebb. The best films, and none of these were of lasting value, were made, as so often, in France. The firm classical culture of that country proved still the most solid framework for the arts. In literature, music and painting, if it produced nothing notable, it did not lower standards. Picasso alone, in his new light-hearted genial mood, produced work of wonderful gaiety and imagination. He painted ceramics, he published lithographs of satyrs and nymphs on sunlit rocks in Provence, he quarrelled with England for failing to admit his Communist friends to its shores, and paid England back by refusing to allow his work to be exhibited in London, and by designing the "dove of peace" which became the emblem of pro-soviet feeling on the eastern side of the "iron curtain." Politics played a greater part in art than ever before.

Creative artists of all kinds were deeply committed to both sides of the great east-west controversy; they took part in the congress dedicated to the freedom of culture held in Berlin and critical of soviet methods, and they were involved in the counterstroke in the form of the "peace" congress summoned originally to meet in Sheffield but finally shifted to Warsaw owing to the inability of many delegates to satisfy the British immigration authorities of their peaceful intentions. In general, metaphysical and moral considerations dominated in the world of art and letters at the expense of aesthetic and "formal" or frankly hedonistic tendencies. The mood was of the kind that Tolstoy would have approved; preoccupied with tormenting doubts about the ends of life which entered into considerations of every issue—whether centenary reappraisals of Wordsworth or R. L. Stevenson in England, or the historical studies in Germany (where only the very old and very grand—Alfred Weber and Friedrich Meinecke—were not engaged on apologies of German nationalism) or the metaphysical writings of French and German philosophers.

. . .

In philosophy, indeed, the great chasm between, on the one hand the clear dry world of Anglo-American (and to some extent Scandinavian) empiricism, with its preoccupation with the importance of different uses of language in life and in the sciences, and, on the other, the darker and more personally anguished world of French and German religious or aesthetic or political metaphysics, was never deeper or more unbridgeable. Neither side recognized merit in the other, and no interpreters appeared to explain these apparently disparate activities to the other camp. To the lucid prose writers of the English-speaking world, the "logic" of, for example, Karl Jaspers appeared at best as a deep, impenetrably dark, romantic meditation whose claim to be a treatise on logic bore no relation to anything which they might understand by this term. Nor did they with any greater degree of success grasp the import of the Gifford lectures of the French existentialist philosopher Gabriel Marcel, or the agonized *pensées* and fragments of Simone Weil. Doubtless to thinkers of this kind, struggling like so many Laocoons with cosmic issues on which they must suppose salvation in some sense to depend, the logical writings of such positivists as Professor Ryle of Oxford, or such logicians as Professor Quine of Harvard, must, in their turn, have appeared thin, arid and almost wholly pointless. As for that quasiphilosophical world in which literature has a common frontier with abstract thought—that unclassifiable no man's land between the two, whose condition serves often as the truest index of the vagaries of the *Zeitgeist*—in that world formalism and positivism seemed to be yielding ground to a kind of neoromantic revival, in which criticism both of the arts and of life drew its inspiration from Dostoevski, Kafka, Kierkegaard and the German romantics, rather

than the tradition of European enlightenment, with its emphasis on clarity, its reliance on accessible evidence, rational argument and secular values.

In the meantime the Communist writers on either side of the "iron curtain" pursued their undeviatingly narrow path, heedless of all but the dogma to which they seemed attached with an ever growing intensity. The most gifted among them, the Hungarian Marxist George Lukács, made some impression when his literary studies, in the course of the year, appeared in an English translation. The world of art and of ideas seemed to be in a state of *détente*, possibly a trough before a splendid crest, but indubitably a trough. It was scarcely made more attractive by the sudden widespread popularity of television as a new method of mass communication; in due course T. S. Eliot gravely warned his English compatriots against this fatal American innovation as likely to destroy the last vestige of fastidious taste. Yet no fewer than 100,000 copies each of *The Iliad* and *The Odyssey* were purchased in the United States in the course of this same year. Matthew Arnold would certainly have abhorred the use, if not the notion, of television; but at the same time he believed passionately in the educational value of the great classics. It is difficult to measure the progress and regression of civilizations, the facts must be left to speak for themselves.

. . .

The principal trends of the moment accurately reflected the social and political state of the world. There was too much uncertainty, too much fear and tension for either of two possibilities to be realized; either of a lyrical and imaginative escape from the repellent realities as had happened during other periods of darkening skies; or, on the other hand of a serious effort toward some realistic technique capable of restating the central problems (even if not their solutions) in a manner adequate to the new kinds of human experience. The works most characteristic of the year 1950, whether they were inspired by Communist or capitalist ideals, whether they were objective and positivist, or personal and romantic, took forms which no longer fitted their relatively new content, and therefore made the result seem either lifeless or curiously ill-compounded—in the latter case, an urgent, earnest, but unsuccessful effort to speak in a medium which had conspicuously outlived its usefulness to an audience all too anxious to be told whatever there was to say by anyone who had something genuinely novel to express and had discovered, what was still missing, some method of effective communication. Never was the world more patently prepared for a new turn in the development of art and, indeed, other forms of thought and imagination, and never did the emergence of new forms created by, or at least appropriate to, the crucial moment seem so obstinately delayed everywhere—no less in Marxist than in non-Marxist and anti-Marxist societies.

# CALENDAR OF EVENTS, 1950

Forelections and disasters of 1950, see under those headings in the text. For obituaries of prominent persons who died during 1950, see under the entry Obituaries.

## JANUARY

**1 U.S. officials** announced that Yugoslavia had been authorized to buy engines and other equipment for civil aircraft in the U.S.

**2 U.S. dept. of commerce** revealed that from July 1, 1945, to Sept. 30, 1949, the U.S. had extended \$24,802,000,000 in grants and credits to foreign nations.

**3 Hungary** was ordered by U.S. government to close its consulates at New York and Cleveland by Jan. 15.

**4 Pres. Harry S. Truman** in his annual state of union message to congress paid tribute to bipartisan co-operation in foreign affairs and urged enactment of his Fair Deal domestic program.

**Economic Cooperation administration** revealed request to each participating nation in Europe except Greece to take a 25% cut in aid for fiscal year 1951.

**5 Pres. Truman** barred any form of U.S. military aid or intervention in Formosa and limited U.S. aid to Chinese nationalists to current ECA program.

**6 British government** advised Communist authorities in Peking that Great Britain was prepared to establish full diplomatic relations with them.

**John Theotokis** formed neutral caretaker government in Athens, Gr., to replace cabinet headed by Alexander Diomedes.

**Sen. Pat McCarran**, chairman of senate judiciary committee, charged that administration of U.S. displaced persons law in Europe had completely broken down.

**8 Atty. Gen. J. Howard McGrath** stated that he supported wiretapping by the FBI because of the emergency which still existed in the U.S.

**9 Mayor William O'Dwyer** of New York city urged the state of New York to legalize and take control over betting on sporting events.

**U.S. freighter "Flying Arrow"** was shelled and damaged by a Chinese nationalist warship off Shanghai.

**Annual budget** submitted to congress by Pres. Truman for fiscal year beginning July 1, 1950, put expenditures at \$42,438,757,406, revenue at \$37,305,586,034, military costs at \$13,544,811,618 and international aid at \$4,710,606,863.

**High-ranking delegates** of 8 British Commonwealth nations met at Colombo, Ceylon, to review current problems in foreign affairs.

**10 Soviet Delegate Jacob A. Malik** walked out of U.N. Security council when it refused to consider at once his resolution for the ouster of the Chinese nationalist delegate.

**British Prime Minister Clement R. Attlee** announced that King George VI had agreed to dissolve parliament on Feb. 3, with general elections to be held on Feb. 23.

**11 Peking radio** broadcast claimed that Chinese Communists controlled entire Chinese mainland with exception of Tibet.

**12 Secy. of State Dean G. Acheson** charged that 4 northern areas of China—Manchuria, Sinkiang and Outer and Inner Mongolia—were being attached to the U.S.S.R.

**Restoration** of death penalty in the U.S.S.R. for treason, espionage and sabotage was decreed by presidium of the supreme council.

**Egyptian cabinet** composed entirely of Wafdist members was formed in Cairo by Mustafa el Nahas Pasha.

**13 U.N. Security council** rejected by vote of 6 to 3 a soviet resolution for the ouster of the Chinese nationalist delegate.

**British Commonwealth conference** at Colombo agreed upon a plan to aid Burma and other southeast Asian areas in building up their economies.

**14 U.S. state dept.** announced that it had ordered 135 U.S. consular representatives and their families to leave China following Communist seizure of U.S. consulate at Peking.

**15 French Foreign Minister Robert Schuman** rejected west German proposals for a modification of French control over the Saar.

**16 Soft-coal miners** in 6 states remained away from pits despite a suggestion by John L.

Lewis that they return to work on a 3-day work week basis.

**17 U.S.S. "Missouri,"** only active battleship in the U.S. fleet, ran aground on a mudbank in Chesapeake bay off Hampton Roads, Va.

**\$1,500,000** was stolen by a group of masked bandits who held up a garage of the Brink's armoured car service in Boston, Mass.

**18 Pres. Truman** accepted resignation of Myron C. Taylor as his personal representative at the Vatican.

**National Labor Relations board general counsel, Robert N. Denham,** petitioned U.S. district court in Washington, D.C., for an unfair labour practice injunction against John L. Lewis and the United Mine Workers.

**19 Bill** to provide \$60,000,000 in economic aid to Korea was defeated in house of representatives by vote of 193 to 191.

**Recall** of Donald R. Heath, U.S. minister to Bulgaria, was demanded by Bulgarian government on ground that he had engaged in espionage activities.

**Secy. of State Acheson** announced that the U.S. would support a U.N. resolution to permit member nations to return their diplomatic envoys to Spain.

**20 House of representatives** voted 236 to 183 to reject proposal to restore to its rules committee the power to block legislation.

**U.S. government** warned Bulgaria in a sharp note that failure to withdraw its demand for recall of U.S. minister in Sofia would force a break in diplomatic relations.

**21 Soviet Foreign Minister Andrei Y. Vishinsky** denounced as false U.S. charges that the U.S.S.R. had infringed upon the territorial integrity of China.

**Alger Hiss** was found guilty by federal jury of perjury in denying that he had passed confidential U.S. documents to Whitaker Chambers, and in denying that he had seen Chambers after Jan. 1, 1937.

**Treaty of friendship,** commerce and navigation between the U.S. and the Republic of Ireland was signed in Dublin.

**Paul J. Larsen** was appointed first chairman of Civilian Mobilization office to bring plans

for wartime civilian defense up to date.

**22 Preston T. Tucker** and 7 associates were acquitted of charges of mail fraud and conspiracy in promoting the Tucker automobile.

**23 Pres. Truman** in special message to congress requested cuts in some wartime excise taxes, to be balanced by closing of so-called tax loopholes and increased corporation and estate and gift taxes.

**Bandung,** capital of Indonesian state of West Java, was raided and held for several hours by guerrilla force led by a former Dutch army officer.

**24 Amendment** to Fair Labor Standards act raising legal minimum wage to 75 cents an hour went into effect at midnight.

**Senate** unanimously confirmed nomination of Adm. Forrest P. Sherman as chief of naval operations.

**25 United Automobile Workers** called nation-wide strike against the Chrysler Corp. to enforce demands for wage increase or pension and welfare program.

**Senate** passed by vote of 63 to 19 a proposed constitutional amendment granting women full equal rights but guaranteeing special legal protection already accorded them by law.

**C.I.O.** revoked the charter of California State Industrial council on ground that it followed the Communist party line.

**Alger Hiss** was sentenced to 5 yr. in prison for perjury by U.S. district judge Henry W. Goddard in New York city.

**26 India** was proclaimed a free and independent republic in colourful ceremonies at New Delhi marked by inauguration of Rajendra Prasad as first president.

**U.S., British and French** commandants in Berlin protested to soviet authorities the continued restrictions on truck traffic in and out of Berlin.

**27 U.N. Trusteeship council** approved an agreement for the administration by Italy of Italian Somaliland as a U.N. trust territory for 10-yr. period.

**Chinese Communists** claimed complete annihilation of last 2 intact nationalist armies in Yunnan province near Indochinese border.

## JANUARY—Continued

**Agreements** for the furnishing of \$1,000,000,000 in U.S. arms aid to Belgium, Denmark, France, the United Kingdom, Italy, Luxembourg, the Netherlands and Norway were signed in Washington, D.C.

**29 French national assembly** approved over vociferous Communist opposition treaties giving Indochinese states of Viêt-Nam, Laos and Cambodia the status of independent states within the French union.

**30 Boston city council** refused to permit 14 Japanese diet members touring the U.S. under army auspices to attend one of its sessions.

**Legislature of West Java** in Indonesia voted to dissolve its state government and surrender its powers to Indonesian federal government.

**31 Pres. Truman** directed U.S. Atomic Energy commission to continue its work on all forms of atomic weapons, including the so-called hydrogen bomb or superbomb.

**Soviet government** announced recognition of rebel Communist regime headed by Ho Chi Minh as the legal government of Viêt-Nam in Indochina.

**United Mine Workers** and soft-coal operators were asked by Pres. Truman to call a 70-day truce and submit points in dispute to a nonstatutory fact-finding board.

**Tibet radio** broadcast an appeal for aid against threatened invasion by Chinese Communist forces.

## FEBRUARY

**Soviet government** demanded the trial of Emperor Hirohito and several other former Japanese war leaders as war criminals by an international war crimes tribunal.

**Senate** approved by vote of 64 to 27 a constitutional amendment changing presidential election system so as to divide each state's electoral votes among candidates in proportion to popular vote.

**German Federal Republic** announced adoption of coat of arms of the Weimar republic, including the eagle, as its official emblem

**2 Major coal mine operators** accepted Pres. Truman's proposal for a 70-day strike truce, pending investigation by a fact-finding board.

**Paul L. Styles** of Alabama was nominated by Pres. Truman to be a member of the National Labor Relations board.

**Sen. Brien McMahon**, chairman of joint congressional atomic energy committee, proposed that the U.S. promote a \$50,000,000,000 global aid program in exchange for atomic disarmament.

**3 Klaus E. J. Fuchs**, British atomic scientist, was arrested by British police on charges of betraying atomic research secrets which might be useful to an enemy.

**4 Pres. John L. Lewis** of United Mine Workers rejected Pres. Truman's proposal for truce in coal industry pending a fact-finding inquiry.

**5 Veterans' Administrator Carl R. Gray, Jr.**, reported that millions of dollars had been wasted on training of veterans in schools set up solely to share in veterans' education funds.

**Federation of American Scientists** urged re-examination of U.S. atomic policy by a nonpartisan commission of experts unattached to any government agency.

**6 Pres. Truman** invoked national emergency provisions of the Taft-Hartley act and appointed a fact-finding board to report to him in the soft-coal dispute.

**German Federal Republic** halted the issuance of licences for export of iron and steel to east Germany.

**Archbishop of Cyprus** advised British Gov. Sir Andrew Wright that 96% of the island's population had voted for union with Greece in an unofficial referendum.

**U.S. High Commissioner John J. McCloy** warned western Germany that the U.S. would use all its power and influence to head off any revival of nazism.

**7 Great Britain** and the U.S. recognized the governments of Laos and Cambodia and the Viêt-Nam government headed by Bao Dai in French Indochina.

**Pres. Truman** accepted resignation of Lewis L. Strauss, one of the original members of the U.S. Atomic Energy commission.

**Organization for European Economic Cooperation** reported that member nations needed \$5,000,000,000 in U.S. aid and a 50% increase in U.S. sales to become self-sustaining by 1952.

**New French cabinet** without Socialist party representation was formed in Paris by Premier Georges Bidault.

**8 Secy. of State Acheson** told a press conference that agreements with the U.S.S.R. were worthless unless they were based on strength and backed by force.

**William Webster**, vice-president of New England Electric system, was named to succeed Karl T. Compton as chairman of Research and Development board.

**Martial law** was lifted throughout Greece by a decree of the Greek government.

**U.S. War Claims commission** ruled that 120,000 former U.S. prisoners of Germany and Japan would receive \$1 for each day of imprisonment on account of substandard rations.

**9 Gen. Douglas MacArthur** announced in Tokyo that Japan had been authorized to establish trade commissions in the U.S. without consular or diplomatic functions.

**10 Export-Import bank** agreed to loan the United States of Indonesia up to \$100,000,000 for the purchase of heavy machinery in the U.S.

**U.S. government** was revealed to have protested forcefully to the Chinese nationalist regime for its bombing attacks on U.S. property in Communist-held Shanghai.

**Senate** passed house-approved bill authorizing \$60,000,000 in aid to Korea and withdrawals up to June 30, 1950, from \$103,000,000 fund for Chinese nationalist aid.

**Klaus E. J. Fuchs** admitted in a signed confession introduced in court that he had passed atomic secrets to the Soviet Union for 7 yrs. because of his devotion to communism.

**11 10-day restraining order** and an unfair labour practice injunction were issued against the United Mine Workers by U.S. District Judge Richmond B. Keech in Washington, D.C.

**12 A. Whitney Griswold** was named to succeed Charles Seymour as president of Yale university effective July 1, 1950.

**13 U.S. supreme court** refused to review a lower court decision holding that use of the hiring hall system on the Great Lakes violated the Taft-Hartley act.

**Conference** of U.S. diplomatic representatives in 14 Asian countries opened in Bangkok, Thailand, under chairmanship of Philip Jessup, U.S. ambassador-at-large.

**Almost all members** of United Mine Workers failed to return to work despite federal court injunction and order of their president, John L. Lewis.

**14 German Federal Republic** released \$23,800,000 in ERP counterpart funds to western Berlin for industrial rehabilitation.

**U.S.S.R. and Communist China** signed a 30-yr. treaty of friendship and mutual aid in Moscow; agreements were also signed which granted a 5-yr. \$300,000,000 soviet credit and eventual return to China of Port Arthur, Dairen and the Changchun railroad.

**Pres. Truman** told a newspaper reporter in a special interview that the U.S.S.R. had broken all its postwar pacts with the U.S. and that he saw no reason to hope it would keep new ones.

**15 British Prime Minister Attlee** stated that, while he did not rule out Winston Churchill's suggestion for a high-level Anglo-U.S.-soviet conference, the matter was in the hands of the U.N.

**Threatened nation-wide telephone strike** was postponed for 60 days by Communications Workers of America at the request of Pres. Truman.

**23 Hungarian government** demanded a reduction in the size of the U.S. and British legation staffs in Budapest.

**House of representatives** approved by vote of 240 to 177 a federal fair employment practices bill based on voluntary co-operation, after shelving a compulsory bill.

**British Labour party** won a narrow victory in parliamentary elections, securing 315 seats while Conservatives obtained 297, Liberals 9 and others 4.

**24 U.S. Atty. Gen. McGrath** ordered the freezing of assets in the U.S. owned by citizens of Bulgaria, Hungary and Rumania.

**United Mine Workers** were ordered by U.S. district court to stand trial on charges of contempt for disobeying the court's injunction against continuance of nation-wide soft-coal strike.

**World Meteorological organization** became U.N. specialized agency with deposit of ratification by Iraq, the 30th member.

**Pres. Truman** forestalled threatened nation-wide strike of Brotherhood of Railroad Trainmen and Order of Railway Conductors by appointing 3-man emergency board under Railway Labor act.

**25 Moscow radio** reported creation of an independent soviet navy ministry.

**Prime Minister Attlee** announced the decision of the British Labour government to continue in office despite its narrow majority in the house of commons.

**German Federal Republic** lifted its embargo on shipments of iron and steel to eastern Germany.

**26 Gen. MacArthur** announced that Japan would be permitted to join in international agreements and technical conferences if the other nations involved were willing.

**27 U.S. and Canada** signed a 50-yr. treaty designed to increase the power output of the

Niagara river and to protect the beauty of Niagara falls.

**28 Soviet council of ministers** issued an order pegging the rouble to gold instead of the U.S. dollar, thus raising the exchange rate from 5.3 to 4 roubles to the dollar.

**New British cabinet** headed again by Clement R. Attlee as prime minister was formed in London.

**U.S. High Commissioner McCloy** denounced proposed elections in soviet zone of Germany as a travesty and again proposed all-German elections on a free and democratic basis.

**MARCH**

**1 Klaus Fuchs** was sentenced to 14 yr. in prison by British court after pleading guilty to charges of giving atomic secrets to the U.S.S.R.

**Generalissimo Chiang Kai-shek** resumed presidency of the Chinese nationalist government.

**Deputies** of the foreign ministers of the U.S., the U.K., France and the U.S.S.R. at their 251st meeting again adjourned discussions on treaty with Austria.

**2 United Mine Workers** were cleared by U.S. court of charges of criminal and civil contempt based on alleged union violation of 2 injunctions ordering resumption of soft-coal production.

**3 House of representatives** approved admission of Alaska as a state by vote of 186 to 146.

**Agreement** giving France a 50-yr. lease on coal mines in the Saar was signed in Paris.

**International Court of Justice** ruled 12 to 2 that U.N. general assembly could not admit new members who had failed to secure majority in Security council or had been vetoed.

**United Mine Workers** and northern, western and captive coal operators agreed on a new contract several hours after Pres. Truman had requested seizure authority from congress.

**4 U.S. state dept.** released statement by former U.S. legation employee in Sofia describing his torture by Bulgarian police to force confession of espionage activities.

**5 Soft-coal operators** and United Mine Workers signed a collective bargaining contract to run until July 1, 1952.

**6 Economic Cooperation administration** revealed that it had held up further aid to British petroleum industry because of restrictions British had imposed on U.S. oil imports.

**U.S., Britain, France** and the Netherlands signed an agreement providing for co-operation in raising standard of living in their territories in the West Indies.

**King George VI** stated in speech from throne at opening of parliament that the Labour government proposed only a limited program of legislation during the session.

**7 House of representatives** approved bill to grant statehood to Hawaii by vote of 261 to 110.

**Judith Coplon** and Valentin A. Gubitchev were found guilty of charges of conspiracy and attempted espionage by federal jury in New York city.

**8 Senate** passed house-approved bill to repeal federal taxes on oleomargarine by vote of 59 to 20.

**British government** announced decision to withhold recognition of Seretse Khama as tribal chief in Bechuanaland because of situation arising out of his marriage to a white woman.

**Gen. Chen Cheng** became premier of nationalist China in succession to Marshal Yen Hsi-shan.

**U.N. Secy.-Gen. Trygve Lie** made public memorandum to all U.N. delegations stating that the U.N. should deal with whatever government exercised effective authority in a country.

**9 Dr. Hermann N. Sander** of Manchester, N.H., was acquitted by jury of charges that he killed a patient suffering from incurable cancer.

**British Labour government** won its first test in new house of commons, defeating motion of censure on nationalization of the steel industry, 310 to 296.

**10 Gerhart Eisler** predicted that all Berlin would be

## MARCH—Continued

taken over by rally of German youth to be held in May.

**II ECA Administrator Hoffman** stated that the U.K. faced the loss of \$150,000,000 in ERP aid unless it co-operated in plan to lower western European trade barriers.

**12 King Leopold III** received 57.68% of the votes cast in popular referendum on his return to Belgium.

**Pope Pius XII** in a Holy Year encyclical called upon Roman Catholics everywhere to counteract atheistic propaganda throughout the world.

**80 persons** were killed in the world's worst aeroplane crash near Cardiff, Wales.

**13 Pres. Truman** submitted to congress 21 plans for reorganizing executive branch of the government, including plans for abolition of maritime commission and office of general counsel of National Labor Relations board.

**General Motors Corp.** reported net earnings in 1949 of \$656,434,232, the largest annual net income ever shown by a U.S. corporation.

**Soviet government** announced that 99.96% of the eligible voters had voted the day before in elections for the supreme council.

**Complete integration** of the Yugoslav zone of Trieste into the Yugoslav economy was reported by Yugoslav officials.

**14 U.K. commissioner general** in southeast Asia announced that British forces in Malaya would be strengthened to cope with increased Communist bandit activity.

**U.N. Security council** voted 8 to 0 to use a single mediator to direct demilitarization of Kashmir and preparations for plebiscite on its future status.

**15 International bank** and the International Monetary fund announced the withdrawal of Poland from their organizations.

**U.S. navy Capt. John G. Crommelin, Jr.**, was furloughed indefinitely on half pay for ignoring orders to cease his attacks on U.S. defense unification.

**16 Sir Ivone Kirkpatrick** was named to replace Gen. Sir Brian H. Robertson as British high commissioner in Germany.

**Secy. of State Acheson** in major foreign policy speech called for soviet co-operation in 7-point program to ease world tensions and permit coexistence of soviet

and western systems in reasonable security.

**French national assembly** ratified U.S. arms aid agreement by vote of 416 to 181 over bitter Communist opposition.

**17 Discovery** of a new element, named californium, was reported by the University of California, Berkeley.

**18 Chinese nationalists** claimed the recapture of the town of Sungmen, on the Chinese mainland 200 mi. S. of Shanghai.

**19 Cuba, Guatemala** and the Dominican Republic were accused by 5-nation investigating committee of having aided conspirators in plots to overthrow governments in neighbouring states.

**Presence** of 2 U.S. destroyers in harbour of Saigon, Indochina, touched off allegedly Communist-inspired demonstrations.

**20 Federal Trade commission** charged 2 U.S. companies with using false and misleading advertising with respect to antihistamine cold tablets.

**U.S. Ambassador Philip C. Jessup** in testimony before senate committee accused Sen. Joseph R. McCarthy of making false and irresponsible statements which endangered U.S. foreign relations.

**21 British foreign office** announced appointment of Sir Gladwyn Jebb to succeed Sir Alexander Cadogan as permanent British delegate to the U.N.

**22 4 U.S. B-29 planes**—the first U.S. arms aid to be received under the Mutual Defense Assistance act—arrived in England.

**Pres. Truman** nominated Thomas E. Murray, a New York industrial engineer, to be a member of the U.S. Atomic Energy commission.

**German Federal Republic** issued proposal for unification of Germany based on nation-wide free elections, freedom of the press and elimination of interzonal barriers.

**23 Sophocles Venizelos** became premier of Greece at the head of a Liberal minority cabinet.

**U.S. labour department** reported that wages of the average worker had increased 130% since 1939 but that his buying power had gone up only 35%.

**Australian Prime Minister Robert G. Menzies** invoked for the first time the Emergency Crimes act as weapon against Communist-inspired strikes.

to transfer the Reconstruction Finance Corp. to the commerce dept.

**Soviet government** charged in a note to the U.S. that the U.S. blockade of Korea was a new act of aggression and stated that the U.S. would be held responsible for damage to soviet interests.

**North Korean troops** were reported to have captured Pyongtaek, 60 mi. S. of Seoul, and to be advancing southward on Chonan.

**7 U.N. Security council** adopted an Anglo-French resolution empowering the U.S. to establish a unified U.N. command in Korea and to appoint a U.N. commander-in-chief.

**Pres. Truman** authorized the U.S. army, navy and air force to build up their forces to the limits needed to cope with the situation in Korea, selective service to be used if required.

**Proposal** for a European payments union was unanimously accepted by 17 European participants in the Marshall plan and by the U.S. at a meeting in Paris.

**8 Pres. Truman** appointed Gen. MacArthur commander-in-chief of all U.N. forces in Korea in accordance with U.N. Security council resolution.

**Army dept.** took over control of the strikebound Chicago, Rock Island and Pacific railroad on order of Pres. Truman.

**9 Gen. MacArthur** authorized the Japanese government to establish a national police reserve of 75,000 men.

**10 U.S. forces** were reported to have halted the advance of North Korean troops halfway between Chonan and Taejon.

**Presidential reorganization plan** took effect making Chairman W. Stuart Symington of the National Security Resources board responsible for the entire U.S. war mobilization program.

**House of representatives** rejected, 249 to 71, Pres. Truman's reorganization plan creating a new executive department of health, education and security.

**Defense dept.** called upon the selective service system for 20,000 men to be inducted into the army at the earliest possible time.

**11 Pres. Truman** named Gordon E. Dean to be chairman of the U.S. Atomic Energy commission and Deputy Undersecy. of State John Peurifoy to be U.S. ambassador to Greece.

**International Court of Justice** ruled in advisory opinion to the U.N. that the Union of

## JULY—Continued

South Africa must have U.N. approval before incorporating mandate of South-West Africa.

**12 Motion** to limit debate on the federal Fair Employment Practices bill failed in the senate by a vote of 55 to 33.

**U.S.** and South Korean forces withdrew south of the Kum river in the face of strong North Korean attacks.

**13 French national assembly** approved new cabinet of Premier René Pleven by vote of 335 to 226.

**All U.S. ground forces** in Korea were placed under the command of Lieut. Gen. Walton H. Walker, commanding general of the 8th army.

**Wosan**, important industrial town on the east coast of Korea, was heavily bombed by U.S. air force planes.

**U.S. court of claims** awarded the Ute Indians of Colorado and Utah \$31,700,000 to compensate them for land taken from them between 1891 and 1938.

**14 U.S.**, British and French governments called upon the U.S.S.R. to permit an impartial investigation of the actual fate of German prisoners of war known to be in soviet custody.

**U.N. Secy.-Gen. Trygve Lie** requested 50 member nations of the U.N. to consider sending combat forces, especially ground troops, to fight in South Korea.

**15 North Korean forces** were reported to have established a bridgehead across the Kum river—major U.S. defense line 20 mi. N. of Taejon.

**16 Gen. MacArthur** announced that the U.S. 7th fleet was instituting air reconnaissance of the Formosa straits and the South China sea.

**17 Federal Bureau of Investigation** arrested Julius Rosenberg of New York, N.Y., on a charge of conspiracy to commit espionage on behalf of the U.S.S.R.

**Main U.S. defense units** were reported to have abandoned Taejon and to be retreating toward Taegu.

**18 British government** announced the cancellation of all petroleum shipments to Communist China.

**Pres. Truman** invoked far-reaching credit restrictions over all phases of public and private housing.

**Secy. of State Acheson** rejected a plea by Indian Prime Minister Nehru urging the admission of Communist China to

the U.N. to end the soviet boycott of that body.

**U.S. 1st cavalry division** made an amphibious landing at Pohang on the east coast of Korea and moved inland without opposition; 25th infantry division landed at southeastern port of Pusan.

**19 42 North Korean planes** were reported damaged or destroyed on the ground by U.S. naval carrier planes.

**Pres. Truman** proposed partial U.S. mobilization in message to congress asking for \$10,000,000,000 for rearmament, the lifting of the statutory ceiling on the armed forces and the power to impose limited economic controls.

**20 Gen. MacArthur** declared in a communiqué that North Korea had lost its chance for victory and that U.S. troops now had a secure hold in South Korea.

**Governments** of the United States of Indonesia and constituent state of republic of Indonesia agreed to substitute unitary state with strong central government for present federal regime.

**Joint session** of the Belgian parliament approved a bill ending the regency and permitting the return to Belgium of King Leopold III.

**21 Army Dept.** ordered the first call-up of nondivisional national guard units and members of organized reserves.

**22 King Leopold III** returned to Belgium from 6 yr. of exile abroad.

**Maj. Gen. William F. Dean**, commander of U.S. 24th division, was officially listed as missing in action in fighting around Taejon.

**North Korean troops** captured Yongdok on the east coast and advanced in the west to Kwangju, 35 mi. from the southern coast of Korea.

**23 Police reinforcements** were called out in Brussels, Belg., to disperse persons demonstrating against the return of King Leopold III.

**24 Pres. Truman** asked congress for \$10,516,976,000 to finance rearmament, including an increase of 600,000 in strength of the armed forces.

**Thailand** informed the U.N. that it was prepared to send a combat force of 4,000 men to Korea.

**25 North Korean forces** captured Yongdong and continued their pressure on withdrawing U.S. forces.

**First U.S. report** to U.N. on Korean war said superiority in weapons and manpower would have to be achieved over aggressor, who had resources available far in excess of its internal capabilities.

**Pres. Truman** asked congress for an immediate \$5,000,000,000 increase in individual and corporate taxes pending development of a more comprehensive tax program.

**Charles M. Spofford** of the U.S. was elected chairman of the North Atlantic Treaty council of deputies at its first meeting in London.

**26 Great Britain**, Australia and New Zealand announced that they had decided to send small contingents of ground forces to Korea.

**Pres. Truman** in his midyear economic report to congress stated that price control, rationing and serious shortages could be avoided if he were granted limited economic controls and a \$5,000,000,000 increase in taxes.

**All-out mobilization** and a general ceiling over the entire U.S. economy was urged by Bernard Baruch in testimony before the senate banking and currency committee.

**Bill** authorizing the expenditure of \$1,222,500,000 under the Mutual Defense Assistance program in fiscal year 1951 was signed by Pres. Truman.

**27 Rioting** between supporters and opponents of King Leopold III broke out in many parts of Belgium.

**Pres. Truman** told his press conference, in answer to a question, that the U.S. would not use the atomic bomb to end the war in Korea.

**28 North Korean forces** launched a major attack against the 200-mi. U.N. defense perimeter in southeastern Korea.

**29 Federal Bureau of Investigation** arrested Abraham Brothman and Miriam Moskowitz in Cliftwood, N.J., on charge of conspiring to commit espionage for the U.S.S.R.

**31 Gen. MacArthur** flew to Formosa for a military conference with Generalissimo Chiang Kai-shek and other Chinese nationalist leaders.

**Pres. Truman** ordered 4 national guard divisions and 2 regimental combat teams into federal service.

**U.S. Atomic Energy commission** revealed in report to congress that atomic energy production during the first half of 1950 had proceeded at the highest rate in the history of the project.

## AUGUST

**Soviet Delegate Jacob A. Malik** ended boycott of U.N. Security council and took over as president; council rejected by vote of 8 to 3 his ruling that the Chinese nationalist delegate could not take part in its meetings.

**U.S. court of appeals** in New York, N.Y., upheld the conviction of 11 Communist leaders on charges of conspiring to teach and advocate the overthrow of the U.S. government.

**2 U.S. Atomic Energy commission** named E. I. du Pont de Nemours & Co. to build and operate plants for production of the hydrogen bomb.

**U.S. forces** in Korea began a general planned withdrawal from Kumchon to position behind the Naktong river in southeastern Korea.

**3 U.N. Security council** defeated soviet resolution under which it would first discuss admission of Communist China and voted to continue discussion of complaint of aggression on the Republic of Korea.

**Pres. Truman** signed bill authorizing the increase of U.S. armed forces to any level required by present or future emergencies.

**4 U.S. forces** repulsed North Korean attempts to penetrate the new U.S. defense line east of Chinju on the south Korean coast.

**U.S. army** issued a mandatory call to 62,000 enlisted reservists for 21 months' active duty.

**Soviet Delegate Malik** introduced a resolution in the U.N. Security council calling for a cease-fire in Korea, withdrawal of foreign troops and participation of Communist China and North Korea in Korean deliberations.

**5 Heavy fighting** was reported to have broken out at Makassar, Celebes, between Indonesian government forces and members of the Netherlands Indies army awaiting discharge.

**6 W. Averell Harriman**, special adviser to Pres. Truman, arrived in Tokyo for a policy conference with Gen. MacArthur.

**U.N. Secy.-Gen. Lie** in annual report again urged the convening of a special peacemaking session of the U.N. Security council to be attended by foreign ministers.

**7 U.S. marine corps** announced plans to mobilize its entire volunteer reserve of 80,000 men.

## AUGUST—Continued

**Canadian Prime Minister Louis St. Laurent** announced that Canada would recruit a special infantry brigade and supporting units for service in Korea.

**U.S. army** and marine troops made gains of up to 5 mi. in offensive action on the southern front east of Chinju.

**Milton F. Gregg** was named minister of labour in the Canadian cabinet; Solicitor Gen. Hughes Lapointe replaced him as veterans affairs minister.

**8 Carroll L. Wilson** resigned as general manager of the U.S. Atomic Energy commission, saying he lacked confidence in the ability of Chairman Gordon E. Dean.

**Henry A. Wallace** resigned from the Progressive party in a dispute over the adoption by it of the soviet line on Korea.

**Florence Chadwick** of San Diego, Calif., swam the English channel from Cap Gris Nez to Dover in the record time of 13 hr. 20 min.

**9 Senate** refused to confirm Pres. Truman's nominations of 2 U.S. judges and 2 members of federal commissions.

**10 U.S. forces** made further advances near Chinju on the southern coast; Yongdok on the eastern coast was retaken by North Korean troops.

**Gen. MacArthur** charged that defeatists and appeasers had misrepresented the purpose of his trip to Formosa which, he said, was limited purely to military matters.

**Soviet Delegate Malik** admitted in the U.N. Security council that the U.S.S.R. had supplied arms to North Korea but only prior to the evacuation of soviet troops.

**House of representatives** passed, 383 to 12, an economic mobilization bill giving Pres. Truman broad powers to control prices, wages, credit and production.

**11 North Korean forces** reached the port of Pohang on the east coast of Korea and threatened a U.S. fighter base near by.

**Consultative assembly** of the Council of Europe adopted a res-

olution proposed by Winston Churchill for the formation of a united European army to defend western Europe.

**Crown Prince Baudouin** was sworn in as ruler of Belgium, taking over the constitutional powers of his father, King Leopold III, who had agreed to abdicate when Baudouin became 21 years old (Sept. 1951).

**Pres. Truman** nominated T. Keith Glennan, president of Case Institute of Technology, Cleveland, O., to be a member of the U.S. Atomic Energy commission

**12 Defense dept.** and Atomic Energy commission issued a detailed handbook of instructions for civilian defense in case of atomic attack.

**Government** of Việt-Nam released a report indicating that Communist guerrilla forces in Indochina were receiving extensive aid from Communist China.

**Large North Korean force** established a bridgehead across the Nakdong river, western bulwark of the U.N. defense perimeter, near Changnyong.

**13 U.S. economic** and military aid was promised to Việt-Nam by Pres. Truman in a special Voice of America broadcast.

**14 U.S. 24th division** troops opened a counterattack against the North Korean bridgehead near Changnyong.

**15 White House** announced that Mayor William O'Dwyer of New York city would be named U.S. ambassador to Mexico after his resignation as mayor on Aug. 31.

**Second child**, a daughter, was born to Princess Elizabeth, heirless presumptive to the British throne.

**16 U.S. superfortresses** heavily bombed several North Korean divisions assembled on the west shore of the Nakdong river near Waegwan.

**Defense Secy. Johnson**, with the approval of Pres. Truman, asked congress for immediate passage of a universal military training law.

**17 Unitary Republic of Indonesia** with a strong central government replaced the United States of Indonesia by procla-

mation of Pres. Achmed Soekarno.

**Gen. MacArthur** urged all member nations to send ground forces to Korea speedily in a report to the U.N. Security council.

**18 Lieut. Gen. Walter B. Smith** was named director of the U.S. central intelligence agency by Pres. Truman.

**Federal Bureau of Investigation** arrested Morton Sobell in Laredo, Tex., on charges of conspiracy to commit espionage on behalf of the U.S.S.R.

**North Korean forces** opened a large-scale offensive along the Nakdong river aimed at Taegu.

**19 Pres. Truman** signed a bill authorizing the entry into the U.S. of 760 Japanese wives and children of members of U.S. armed forces.

**20 British war office** announced its decision to send immediately a British infantry force from Hong Kong to Korea.

**Proposals** for putting North Korea under U.N. trusteeship at the cessation of hostilities were denounced by John M. Chang, South Korean ambassador to the U.S.

**Gen. MacArthur** warned Kim Il Sung, North Korean premier and commander in chief, that he would be held personally responsible for further Communist atrocities against U.N. troops.

**21 Senate** approved, 85 to 3, an economic mobilization bill giving Pres. Truman wide powers but directing the simultaneous imposition of wage and price controls.

**22 All Canadian railroads** were tied up by a nationwide strike of nonoperating personnel.

**U.N. Mediator** Sir Owen Dixon reported that there was no immediate prospect for agreement between India and Pakistan on a plebiscite in the princely state of Kashmir.

**23 French authorities** in Indochina published the text of a document which was allegedly a treaty between the Việt-Minh rebels and the Chinese Communist government providing for armed intervention by the latter.

**24 Pres. Truman** announced that he had nominated Walter J. Donnelly to be minister to and the first U.S. civilian high commissioner in Austria.

**Chinese Communist government** charged in a message to the U.N. Security council that U.S. policy with respect to Formosa was a direct armed attack on Chinese territory.

**25 Scheduled nation-wide strike** of 300,000 railroad trainmen and conductors was called off shortly after Pres. Truman ordered federal seizure of the railroads.

**26 White House** and state dept. repudiated a speech made the day before by Navy Secy. Francis Matthews to the effect that the U.S. should be willing even to start a war to compel co-operation for peace

**27 North Korean forces** advanced to within a few miles of the port of Pohang in an offensive against the eastern end of the U.N. defense perimeter.

**Chinese Communist government** charged that U.S. planes had attacked a Manchurian railway station and airfield on the Chinese side of the Yalu river.

**28 Allied High commission** in Germany decreed the dissolution of the I. G. Farbenindustrie chemical trust.

**Pres. Truman** signed the Social Security act amendments of 1950, providing for broadened social security coverage and greatly increased benefits.

**Soviet Delegate Malik** demanded that the U.N. Security council omit from its annual report to the general assembly any reference to action taken during the soviet boycott of the council.

**White House** announced that Pres. Truman had directed Gen. MacArthur to retract his statement to a veterans' convention implying that the U.S. should occupy Formosa.

**AUGUST—Continued**

**30 Canadian parliament** in emergency session passed a bill ordering the resumption of strikebound railway service within 48 hr.

**House of representatives** cited Edward A. Rumely of the Committee for Constitutional Government and William L. Patterson of the Civil Rights congress for contempt for refusal to answer questions of its lobbying committee.

**31 Both houses of congress** passed and sent to the White House a compromise bill to provide dependency allowances for families of enlisted personnel in the armed forces.

**U.S. Delegate Warren R. Austin** admitted in the U.N. Security council that a U.S. fighter plane might have strafed by mistake an airstrip 5 mi. inside Manchuria.

**SEPTEMBER**

**1 North Korean forces** opened an all-out offensive along a 50-mi. front south of the Chang-yong bridgehead.

**Pres. Truman** announced in a nation-wide broadcast plans for the mobilization of 3,000,000 men and the entire U.S. productive machine. He also announced an 8-point outline of U.S. beliefs in and desires for world peace.

**Soviet government** announced the appointment of Maj. Gen. A. P. Kislenko as soviet member of the Allied council for Japan in succession to Lieut. Gen. K. N. Derevyanko.

**2 Greek government** offered to dispatch a brigade of volunteer troops to join U.N. forces in Korea.

**All elements** of the U.S. far east air forces went into action in support of U.N. ground forces at the Naktong river line.

**British Prime Minister Attlee** declared in answer to Conserv-

ative criticism that the U.K. would never damage essential defense needs in order to ship goods to the U.S.S.R.

**3 Lieut. Gen. George E. Stratemeyer**, commander of the U.S. far east air forces, reported that bombing had virtually halted North Korean rail traffic south of the 37th parallel.

**4 U.N. commission** on Korea declared in its annual report to be presented to the general assembly that North Korea had launched an unprovoked and premeditated attack on South Korea.

**5 Yugoslav Foreign Minister Edward Kardelj** condemned Communist aggression in Korea as a threat to world peace.

**Army dept.** requested selective service to provide 70,000 men in November, thus raising its total requests to 170,000.

**U.S. Delegate Warren Austin** told the U.N. Security council that a bomber bearing a red star had been shot down by U.S. naval forces in Korean waters and the body of a soviet air force officer found near the wreckage.

**6 U.S.S.R. vetoed** a Security council resolution condemning North Korea for continued defiance of the U.N. and asking all nations to withhold aid to North Korea.

**Pres. Truman** apologized to the U.S. marine corps for his "unfortunate choice of language" in a letter to Rep. Gordon L. McDonough criticizing the corps.

**Secy. of State Acheson** stated at a press conference that it was highly desirable to find a way in which western Germany could take part in defending western Europe.

**U.S.S.R. charged** that the soviet bomber shot down in Korean waters was attacked by 11 U.S. planes without provocation while on a training mission.

**7 Pres. Truman** personally carried his apology to the marine corps to a convention of the Marine Corps league at Washington, D.C.

**Dept. of the air force** ordered 5 air national guard groups into active federal service.

**Immediate dissolution** of almost all Roman Catholic religious orders in Hungary was decreed by the Hungarian government.

**8 Pres. Truman** signed the Defense Production act of 1950, giving him emergency powers over the U.S. economy; federal reserve board ordered limited restrictions on installment buying.

**Secy. of State Acheson** was authorized by presidential executive order to begin operation of the Point Four program for aid to underdeveloped areas.

**Hugh L. Keenleyside** of Canada was appointed director-general of the U.N. Technical Assistance administration to handle aid programs for underdeveloped areas.

**9 W. Stuart Symington**, chairman of the National Security Resources board, was named co-ordinator of economic mobilization by Pres. Truman.

**Pres. Truman** announced that he had authorized substantial increases in U.S. military forces in western Europe.

**10 Commerce Secy. Sawyer** announced the formation of the National Production authority headed by William H. Harrison to handle priorities, allocations and inventory controls under the defense mobilization program.

**11 Greek Premier Venizelos** formed a new cabinet composed of Liberal, Populist and Socialist-Democratic party members.

**12 U.S.S.R. vetoed** the appointment of a U.N. commission to investigate Communist China's charge that U.S. planes had attacked Manchurian territory.

**Pres. Truman** accepted the resignation of Defense Secy. Johnson and said he would appoint Gen. George C. Marshall to the post as soon as congress passed enabling legislation.

**Foreign ministers** of the U.S., the U.K. and France met at New York, N.Y., to review the world situation and Europe's defense needs.

**13 Presidential emergency board** denounced the growing practice by railroad unions

of creating an emergency to force appointment of an emergency board whose recommendations they would accept only if favourable.

**14 Pres. Truman** announced that he had directed the state dept. to make new efforts to obtain a peace treaty with Japan.

**15 Elements** of the U.S. 1st marine division made an amphibious landing at Inchon, port of Seoul, after heavy naval bombardment.

**Congress** completed action on legislation permitting Gen. George C. Marshall to serve as defense secy. despite the fact that he had been an active army officer within the past 10 yr.

**16 Pres. Truman** accepted the resignation of Robert N. Denham as general counsel of the National Labor Relations board.

**Economic Cooperation administration** reduced aid to Greece by about 10% on the ground that the Greek government had not shown sufficient progress in its own recovery efforts.

**17 National Production authority** ordered manufacturers to limit purchases of 32 strategic materials to quantities reasonably needed for deliveries.

**U.S. marines** captured Kimpo airfield, 15 mi. N.W. of Seoul; South Korean marines captured Mokpo, 200 mi. S. of Seoul, in an amphibious assault.

**18 Pres. Truman** sent to congress a master plan for organizing civil defense against air and atomic attack.

**Gen. MacArthur** reported to the U.N. Security council evidence that the U.S.S.R. had supplied North Korea with munitions during 1949 and 1950.

**Gen. Omar N. Bradley**, chairman of the U.S. joint chiefs of staff, was promoted to the 5-star rank of general of the army.

**19 Motion** censuring the British Labour government for its decision to nationalize the steel industry early in 1951 was defeated in the house of commons, 306 to 300.

**Annual session** of the U.N. general assembly met at Flush-

The pictures on this page are, left to right:

ing Meadow, N.Y., and rejected Indian and soviet proposals for the admission of Communist China to the assembly and other U.N. organs.

**Foreign Ministers** of U.S., U.K. and France issued a communiqué stating that their governments would treat any attack on western Germany or western Berlin as an attack upon themselves.

**20 U.S. marines** crossed the Han river northwest of Seoul and cut the main highway from Seoul to Pyongyang.

**21 Appointment** was announced of Ernest G. Jansen as governor general of the Union of South Africa in succession to Maj. G. B. van Zyl, effective Jan. 1, 1951.

**Commerce dept.** prohibited the unlicensed export of strategic goods to Hong Kong and Macao, to stop their possible re-export to Communist China.

**Pres. Truman** told a press conference that the U.N. must decide whether U.N. forces should advance above the 38th parallel and that the U.S. would abide by its decision.

**22 Nobel peace prize** for 1950 was awarded to Ralph J. Bunche, director of the U.N. trusteeship division and former U.N. acting mediator in Palestine.

**Pres. Truman** vetoed the Internal Security act of 1950, saying it would aid, rather than weaken, the U.S. Communist movement; house of representatives overrode his veto, 286 to 48.

**Congress** approved and sent to the White House the Revenue act of 1950 providing for an annual increase of \$4,700,000,000 in personal and corporate taxes.

**U.S. forces** captured Suwon and its airstrip, 16 mi. S. of Seoul; U.N. forces made wide gains west and northwest of Taegu.

**23 Congress** recessed until Nov. 27 after the senate voted, 57 to 10, to override Pres. Truman's veto of the Internal Security act.

**24 U.S. marines** crossed the Han river southwest of Seoul and isolated the city from the west.

**25 Pres. Truman** accepted the resignation of Paul G. Hoffman as Economic Cooperation administrator and chose deputy administrator William C. Foster to succeed him.

**U.S. Supreme Court Justice Robert H. Jackson** reversed a federal appellate court and ordered that 10 of the 11 convicted

Communist leaders be admitted to bail pending appeal.

**U.S. marine** and army troops fought their way into Seoul proper from 3 sides against determined Communist opposition.

**26 Seoul** fell to U.S. troops; motorized column of the U.S. 1st cavalry division met 7th division troops moving south from Suwon to form a line from southeast Korea to Seoul.

**North Atlantic council** agreed upon the establishment at the earliest possible time of an integrated defense force for western Europe.

**27 Walter S. Gifford**, former chairman of American Telephone and Telegraph Co., was named to succeed Lewis W. Douglas as U.S. ambassador to the U.K.

**28 Pres. Truman** named Robert A. Lovett to be deputy secy. of defense and George J. Bott to be general counsel of the National Labor Relations board.

**U.N. general assembly** admitted Indonesia as the 60th member of the U.N. by acclamation.

**29 South Korean troops** who had reached the 38th parallel in their drive up the eastern Korean coast were ordered to halt for regrouping.

**U.N. Security council** approved, 7 to 3 (1 member abstaining), a proposal to invite Communist China to participate in discussion of the Formosa issue.

**U.N. general assembly** chose Brazil and the Netherlands to replace Cuba and Norway as nonpermanent members of the Security council, effective Jan. 1, 1951.

**Gen. MacArthur** on behalf of the U.N. command handed over the city of Seoul to Pres. Syngman Rhee of the Republic of Korea.

**30 Pres. Truman** awarded the congressional medal of honor to Maj. Gen. William F. Dean, missing in action, for exceptional heroism in the defense of Korea.

## OCTOBER

**Gen. MacArthur** demanded the unconditional surrender of North Korean forces in a radio message directed to their commander in chief.

**Elements** of the South Korean 3rd division crossed the 38th parallel into North Korea.

**Chinese Premier Chou En-lai** stated in a speech that Communist China would not stand aside

if the territory of North Korea were invaded.

**Local**, state and federal police in western Germany broke up Communist plans for a national resistance demonstration.

**2 Soviet government** rejected the demand of the U.S. for information about German prisoners of war still in soviet hands.

**National Production authority** promulgated a priorities system giving defense dept. and Atomic Energy commission contracts priority over civilian requirements.

**3 Far Eastern commission** announced that Japanese courts had been given jurisdiction over all U.N. nationals residing in Japan except troops and officials and their families.

**Getulio Vargas**, dictator of Brazil from 1930 to 1945, was elected to a 5-yr. term as president in national elections.

**4 U.S. state dept.** revealed that Turkey had accepted an invitation to consult with North Atlantic treaty nations on Mediterranean defense problems.

**5 National Labor Relations board** revealed that in the future it would limit itself to labour disputes seriously affecting interstate commerce.

**Pakistan** announced that it had driven back a body of Afghan tribesmen and regular troops which had invaded its territory in the Dobandi area.

**6 Pres. Truman** ordered registration of doctors, dentists and veterinarians less than 50 yr. old who were not in the armed forces or the reserves, and who had not served at least 21 months. First group to register would be those who were trained at government expense or deferred to complete medical training.

**7 New York Yankees** won the world series by defeating the Philadelphia Phillies in 4 straight games.

**Pres. Truman** appointed Alan Valentine to be administrator of the Economic Stabilization agency.

**U.N. general assembly** approved, 47 to 5, a resolution which gave tacit approval to the crossing of the 38th parallel into North Korea by U.N. troops.

**Turkey** was selected by the U.N. general assembly to succeed Egypt as a nonpermanent member of the Security council, effective Jan. 1, 1951.

**Elements** of the U.S. 1st cavalry division made the first U.S. crossing of the 38th parallel near Kaesong.

**9 Gen. MacArthur** called upon North Korean forces for the last time to lay down their arms and surrender.

**Soviet government** charged in a note to the U.S. that 2 U.S. fighter planes had strafed a soviet airport about 60 mi. N. of the Korean border.

**Sen. Homer Ferguson** accused the national administration of deliberately ordering mass detention of aliens seeking to enter the U.S. in order to undermine the Internal Security act.

**10 Gen. MacArthur's** demand for unconditional surrender was rejected by North Korean Premier Kim Il Sung.

**U.S. government agencies** announced drastic restrictions on financing terms for new 1- and 2-family homes.

**Cyrus S. Ching** was named chairman of the U.S. Wage Stabilization board by Pres. Truman.

**Wonsan**, North Korean port 100 mi. N. of the 38th parallel, was captured by 2 South Korean divisions.

**Lieut. Gen. Nathan F. Twining** was nominated by Pres. Truman to be vice-chief of staff of the air force with the rank of full general.

**Federal Communications commission** authorized the Columbia Broadcasting system to begin colour television broadcasts.

**12 U.S.S.R.** vetoed a U.N. Security council resolution that Secy.-Gen. Trygve Lie serve a second 5-yr. term.

**U.N. interim committee** on Korea ruled that the South Korean government did not have any jurisdiction over North Korea and asked Gen. MacArthur to take over administration of liberated areas.

**State dept.** cancelled all outstanding visas for entry into the U.S. pending investigation under the Internal Security act.

**13 Further limitations** were imposed on consumer installment buying by the federal reserve board.

**14 South Korean cabinet** issued a statement rejecting the decision of the U.N. interim committee on Korea to limit South Korea's authority to territory below the 38th parallel.

**15 Pres. Truman** and Gen. MacArthur conferred at Wake Island in the Pacific ocean west of Hawaii for several hours (Wake time).

**David Ben-Gurion** resigned as premier of Israel in a dispute

**OCTOBER—Continued**

with conservative cabinet members demanding less stringent government economic controls.

**16 French forces** in Indochina were revealed to have abandoned 250 mi. of the frontier with China to Viet-Minh rebels.

**17 U.S. government** agreed to give France up to \$2,400,000,000 in arms and equipment during 1951 to bolster its defenses in Europe and military operations in Indochina.

**18 Pres. Truman** ordered the U.S. coast guard to place all U.S. ports and shipping under virtual wartime control.

**Brigade of Turkish troops** began disembarking at the port of Pusan, Korea.

**Connie Mack**, 87, resigned as field manager of the Philadelphia Athletics baseball club after managing the team for 50 yr.

**19 Sir Stafford Cripps** resigned as chancellor of the exchequer in the British cabinet because of ill health; Hugh Gaitskell was named to succeed him.

**U.S. government** admitted that U.S. fighter planes had attacked a soviet airfield north of Korea and offered to make restitution.

**20 Pyongyang**, capital of North Korea, was captured by U.N. forces; U.S. paratroopers were dropped at Sunchon and Sukchon, 25 mi. to the north, to cut off the Communist retreat.

**21 French high command** in Indochina revealed the evacuation of Lang Son, key post on the Chinese border.

**Lobbying committee** of the house of representatives issued a report showing that 152 U.S. corporations spent \$32,124,835 on activities relating to attempts to influence legislation in the period Jan. 1, 1947–June 1, 1950.

**22 Mines** blocking entry to the North Korean port of Wonsan were reported by U.S. navy officers to be of soviet manufacture.

**23 Justice dept.** began a nation-wide roundup of 86 leading U.S. alien Communists for deportation under the Internal Security act.

**Pres. Truman** appointed a bipartisan subversive activities control board under the Internal Security act.

**Defense Secy. Marshall** ordered the armed forces to release all involuntarily activated reservists and national guardsmen after completion of training if replacements were available.

**24 Pres. Truman** in an address before the U.N. general assembly urged that fresh impetus be given to world disarmament by merging the U.N. commissions on atomic energy and conventional armaments into a disarmament commission.

**25 K. T. Keller**, president of Chrysler Corp., was named director of the armed forces guided missiles program by Defense Secy. Marshall.

**Chinese Communist government** revealed that one of its field armies had been ordered to invade Tibet.

**U.S. Atomic Energy commission** appointed Marion W. Boyer, an oil company official, to be its general manager.

**26 National Production authority** imposed an immediate ban on the construction of new buildings for amusement, recreational or entertainment purposes.

**Canada** and the U.S. signed a 6-point statement of principles designed to unify their full industrial potential in the interests of continental defense.

**1950 Nobel prize** for medicine was awarded to Philip S. Hench and Edward C. Kendall of Rochester, Minn., and Tadeusz Reichstein, of Basel, Switz., for their research on hormones.

**South Korean forces** drove to the Manchurian border near the town of Chosan.

**27 Strong Communist counterattacks** forced South Korean forces to withdraw southward from the Manchurian border.

**28 Far-reaching economic, fiscal and land reforms** were recommended to save the Philippines from total collapse by the report of the Bell commission made public by the White House.

**29 U.S. 7th division** made an amphibious landing at Iwon, 127 mi. N. of Wonsan, on the east coast of North Korea.

**King Gustav V** of Sweden died at the age of 92 and was succeeded by his eldest son, Gustav VI.

**30 Indian foreign office** reported that Chinese Communist troops had penetrated Tibet to a point within 200 mi. of Lhasa, the capital.

**Israeli Premier Ben-Gurion** resolved a cabinet crisis by forming a new 4-party coalition cabinet.

**Uprising** of Nationalist party members seeking immediate independence broke out in Puerto Rico.

**31 Justice dept.** revealed that aliens with only nominal membership in totalitarian parties would be admitted temporarily to the U.S. under the Internal Security act.

**New session** of the British parliament was opened by King George VI in a speech from the throne in which he forecast perpetuation of World War II economic controls.

**Communist forces** were reported to have launched a strong counterattack on South Korean forces on the east coast of Korea 50 mi. S. of the Manchurian border.

**NOVEMBER**

**2 assassins**, identified as Puerto Rican nationalists, made an abortive attempt to kill Pres. Truman in an attack upon Blair house, the president's temporary residence.

**U.N. general assembly** voted, 46 to 5, to extend Secy.-Gen. Trygve Lie's term for an additional 3 yr.

**Pope Pius XII** in a papal bull proclaimed the assumption of the Virgin Mary to be a dogma of the Roman Catholic Church.

**2 Pres. Truman** announced the appointment of E. Roland Harriman, New York banker, as president of the American Red Cross in succession to Gen. George C. Marshall.

**U.N. forces** in northwest Korea were reported to have made withdrawals in the face of Communist attacks.

**Pedro Albizu Campos**, leader of the Puerto Rican Nationalist party, was arrested in San Juan P.R., in a roundup of nationalist and Communist leaders.

**3 U.N. general assembly** approved, 52 to 5, a U.S.-sponsored plan permitting it to deal with any breach of world peace, if a veto prevented the Security council from acting.

**Soviet government** requested the U.S., the U.K. and France to confer on the so-called Prague plan for unification of Germany under a constitutional council.

**4 U.N. general assembly** voted, 38 to 10, to revoke its ban on the sending of diplomatic envoys to Spain and on Spanish participation in U.N. specialized agencies.

**5 Heavy attacks** by strong North Korean and Chinese forces compelled U.N. forces to make slight withdrawals in northwest Korea.

**6 Gen. MacArthur** charged in a special communique that alien Communist forces had moved from Manchuria into

North Korea; he described them as Chinese Communists in a detailed report to the U.N. Security council.

**Tribhuvana Bir Bikram Jung Bahadur** was deposed as king of the Himalayan kingdom of Nepal by the hereditary prime minister, Sir Mohan Shumsher Jung Bahadur Rana.

**7 Republican party** gained 30 seats in the house of representatives and 5 senate seats but failed to win control of congress; important Republican gains were scored throughout the U.S.

**Chinese Communist radio** at Peking reported that several thousand volunteers were already in Korea.

**8 U.N. Security council** voted, 8 to 2, to request Communist China to participate in its discussion of charges that Chinese Communist troops had intervened in North Korea.

**Sinuiju**, temporary North Korean capital, was reported to have been virtually destroyed by a U.S. bomber and fighter plane attack.

**9 Defense Secy. Marshall** announced the selection of Mrs. Anna M. Rosenberg of New York to be asst. defense secy. in charge of manpower and personnel policy.

**33,000 members** of the C.I.O. Communications Workers of America went on strike against 2 American Telephone and Telegraph subsidiaries in 42 states.

**10 U.N. Food and Agriculture organization** elected Spain and the German Federal Republic to full membership.

**Swedish academy** awarded the 1949 Nobel literary prize to U.S. novelist William Faulkner, the 1950 literary prize to British philosopher Bertrand Russell, the physics prize to Cecil Frank Powell of the U.K. and the chemistry prize to Otto Diels and Kurt Alder of Germany.

**John D. Small** of New York was named chairman of the defense dept.'s munitions board by Pres. Truman.

**U.S., British and French governments** formally protested soviet interference with Austrian federal police in the soviet zone of Austria.

**11 Communist China** rejected the U.N. Security council's invitation to take part in the discussion of charges that it had intervened in North Korea.

**12 Former Army Secy. Gordon Gray** recommended in a report to Pres. Truman that U.S. aid to Europe be continued for an additional 3 or 4 yr. but at a reduced rate.

## NOVEMBER—Continued

**13** State of siege was ordered in Venezuela after Lieut. Col. Carlos Delgado Chalbaud, president of the military junta, was assassinated.

**Communist China's** invasion of Tibet was denounced as a clear case of aggression in a Tibetan plea for aid received by the U.N.

**14** Pres. Truman requested congress to enact immediately an excess-profits tax retroactive to July 1, 1950, to yield an additional \$4,000,000,000 annually in federal revenue.

**U.S. marines** captured Hagaru at the southern end of the key Changjin reservoir in North Korea.

**15** Federal Communications commission order authorizing the Columbia Broadcasting system to begin commercial colour telecasts was temporarily suspended by a federal court in Chicago.

**Economic Cooperation administration** announced that Spain would be granted dollar loans through the Export-Import bank from the \$62,500,000 fund appropriated for that purpose by congress.

**U.S. army** reported that a special Canadian brigade of 10,000 men would be trained in the U.S. for service in Korea or with the North Atlantic defense forces.

**16** Pres. Truman issued a statement assuring the Chinese Communist government that the U.S. did not intend to invade China.

**U.N. general assembly** approved plans to set up a separate U.N. postal agency with its own postage stamps.

**Immediate** British withdrawal from the Suez canal zone and the Anglo-Egyptian Sudan was demanded by Egyptian Premier Mustafa el Nahas Pasha in a speech to parliament.

**Commerce Secy. Sawyer** cleared Michael E. Lee, suspended department economist, of disloyalty and then dismissed him on security grounds.

**17** Communist China rejected a second Indian protest against the Chinese Communist invasion of Tibet.

**Indian Prime Minister Nehru**

made public plans for reducing the size of India's 300,000-man army.

**18** Gen. MacArthur reported in reply to criticism that ample winter equipment was available in Korea but said its distribution had been delayed by rapid U.N. advances.

**19** Agreement between 3 television networks and 1 local station and the Television authority representing 5 A.F. of L. unions averted a nation-wide strike of television performers.

**20** Troops of the U.S. 7th division reached the Manchurian border on the Yalu river in northeast Korea.

**U.N. general assembly** approved, 51 to 5, Secy.-Gen. Lie's proposal for a 20-yr. world peace program.

**International Court of Justice** ruled that no country had the right to decide that a person was a political refugee without consulting the nation from which he fled.

**Chile** announced the purchase from the U.S. of 2 U.S. cruisers for \$8,000,000.

**21** British Foreign Secy. Ernest Bevin told the house of commons that British forces would remain in the Egyptian area until the 1936 Anglo-Egyptian treaty was terminated by mutual consent.

**Pres. Truman** signed an executive order permitting the appointment of persons of outstanding ability as unpaid government consultants.

**22** Atty. Gen. J. Howard McGrath in a petition to compel registration of the U.S. Communist party under the Internal Security act charged that the latter was dominated and controlled by the soviet government and Communist party.

**78 persons** were killed and more than 200 injured when a Long Island railroad express train ran into a local in New York city, N.Y.

**23** French forces in Indochina were accused by Communist China of making attacks on the Chinese border provinces of Yunan, Kwangsi and Kwangtung.

**24** U.N. forces launched a general offensive against Chi-

nese Communist and North Korean forces in northwestern Korea.

**Chinese Communist** delegation headed by Wu Hsiu-chuan arrived in the U.S. to participate in U.N. Security council discussions of alleged U.S. aggression in Formosa.

**25** U.N.-sponsored state of Libya established an appointed national constituent assembly in Tripoli.

**Hurricane winds** caused severe damage on the U.S. eastern seaboard, while a record blizzard paralyzed western Pennsylvania, Ohio and West Virginia.

**New steel plant** with annual capacity of 236,000 tons and costing \$87,425,000 was opened in Huachipato, Chile.

**26** U.N. forces driving toward the Manchurian border on the Yalu river were thrown back by strong Chinese Communist counterattacks.

**27** Congress reconvened and was requested by Pres. Truman to enact a 5-point program including supplemental defense and atomic energy appropriations, statehood for Hawaii and Alaska, an excess profits tax, rent control extension and aid to Yugoslavia.

**28** Gen. MacArthur charged that the U.N. faced an entirely new war by virtue of the presence of more than 200,000 Chinese Communist troops in North Korea.

**U.S. Delegate Warren Austin** accused Communist China in the U.N. Security council of open and notorious aggression in Korea.

**Chinese Communist forces** advanced 25 mi. S. of Tokchon through a break in South Korean lines.

**U.S. Atomic Energy commission** announced the selection of a 250,000 ac. tract in South Carolina as the site for hydrogen bomb plants.

**U.S. government** issued stricter regulations for the entry into the U.S. of foreign diplomats and U.N. personnel.

**29** U.N. forces in North Korea were reported to be retreating southward under heavy attack by Chinese Communist

forces who reached Sinchang, 30 mi. N.E. of Pyongyang.

**National Council of the Churches of Christ in the U.S.** was formally established in Cleveland, O., by delegates of 25 Protestant denominations and 4 Eastern Orthodox churches.

**U.S. bureau of labour statistics** announced that on Oct. 15, 1950, the cost of living index had risen to 174.8% of the 1935-39 average, a record high.

**Pres. Truman** in a special message to congress urged the immediate appropriation of \$38,000,000 for famine relief in Yugoslavia.

**30** Mayor Michael V. DiSalle of Toledo, O., was named price stabilization director by Pres. Truman.

**U.S.S.R.** vetoed a U.N. Security council resolution calling upon Communist China to withdraw its troops from Korea.

**Pres. Truman** stated at a press conference that, if necessary, the atomic bomb would be used to assure victory in Korea.

**United Steelworkers of America** signed agreements with U.S. Steel Corp. and Bethlehem Steel Co. providing for average wage increases of 10%.

## DECEMBER

**1** Pres. Truman announced the appointment of former Gov. Millard F. Caldwell, Jr., of Florida as U.S. civilian defense administrator.

**Gen. MacArthur** stated that U.N. forces in Korea were being enormously handicapped by orders forbidding them to attack targets in Manchuria.

**Congress** was requested by Pres. Truman to appropriate an additional \$17,978,247,000 for U.S. defenses in fiscal year 1951.

**2** U.N. general assembly approved the federation with

DECEMBER—Continued

Ethiopia of the former Italian colony of Eritrea.

**3 Mohammed Idris el Senussi**, leader of the Senussi tribe, was elected emir of Libya by the national constituent assembly.

**4 British Prime Minister Attlee** arrived in Washington, D.C., to confer with Pres. Truman on the situation in Korea.

**U.S. supreme court opinion** criticized the patent office for abusing its discretion by permitting "gadgets" to be patented.

**West German interior ministry** announced plans for the formation of a special frontier protection corps to prevent infiltration of undesirable elements.

**Pyeongyang**, capital of North Korea, was evacuated by U.N. forces in the face of heavy Chinese Communist pressure.

**5 Espionage conviction** of Judith Coplin was reversed by a U.S. court of appeals because of trial irregularities.

**House of representatives** approved, 378 to 20, a bill to place a 75% tax on excess profits retroactive to July 1, 1950.

**13 far eastern and middle eastern nations** issued an appeal calling upon Chinese Communist forces in Korea to halt at the 38th parallel pending peace negotiations.

**6 French cabinet** accepted a compromise proposal to incorporate west German combat teams into the North Atlantic defense forces.

**7 U.S. court of appeals** in New York city upheld the conviction of Alger Hiss on charges of perjury.

**Gen. Jean de Lattre de Tassigny**, commander of western European union ground forces, was named supreme military

and political commander in Indochina.

**8 Pres. Truman and Prime Minister Attlee** issued a communiqué saying they were agreed that there should be no appeasement in Korea but calling on China to negotiate a peaceful settlement.

**General Motors Corp.** and Ford Motor Co. rejected a request by Economic Stabilization Director Valentine to suspend price increases.

**Commerce dept.** issued an order prohibiting U.S. ships and planes from carrying strategic materials from foreign ports to China, the U.S.S.R., soviet satellites and Hong Kong and Macao.

**9 Harry Gold**, confessed soviet atomic spy, was sentenced to a maximum term of 30 yr. in prison by a federal court in Philadelphia, Pa.

**10 Generalissimo Francisco Franco** of Spain demanded the return to Spain of the British Mediterranean fortress of Gibraltar.

**25,000 marines** and other troops joined up with U.N. forces near Hungnam after a bloody 60-mi., 2 week retreat from the Changjin reservoir.

**11 House of representatives** passed and sent to Pres. Truman a bill to extend federal rent controls through March 31, 1951.

**U.S. supreme court** ruled that witnesses before grand juries could refuse to answer questions about Communist affiliations on the ground of self-incrimination.

**British colony** of Singapore was torn by widespread Moslem rioting touched off by the order of a British court returning the 13-yr.-old bride of a Moslem to her Dutch mother.

**12 West German spokesman** in Bonn criticized the plan for integration of German combat teams into North Atlantic defense forces and insisted upon the organization of full German divisions.

**Evacuation** of U.N. forces in northeastern Korea was begun through the port of Hungnam.

**13 Economic Cooperation administration** made pub-

lic an Anglo-U.S. agreement for the suspension of U.S. aid to the U.K. on Jan. 1, 1951.

**Members** of the Brotherhood of Railroad Trainmen started an unauthorized strike against 15 railroads in the Chicago area.

**North Atlantic council** of deputies and military committee endorsed the plan for integration of west German combat teams into North Atlantic defense forces.

**14 U.N. general assembly** voted, 52 to 5, to authorize a 3-man commission to attempt to arrange a cease-fire in Korea.

**Gov. Thomas E. Dewey** of New York demanded total mobilization of U.S. resources, including the creation of a 100-division army, to meet soviet aggression.

**Senate** armed services committee cleared Mrs. Anna M. Rosenberg of charges of association with Communists and approved her nomination as asst. defense secy.

**15 Pres. Truman** in a nationwide radio address called upon the American people to convert the U.S. into an arsenal of freedom.

**16 Pres. Truman** proclaimed a state of national emergency and made Charles E. Wilson, president of General Electric Co., director of defense mobilization.

**Economic Stabilization agency** ordered new automobile prices frozen at Dec. 1, 1950, levels.

**U.S. government** froze all Chinese Communist funds in U.S. territory and barred U.S. ships from Chinese Communist ports.

**17 Chinese Communist** forces made unsuccessful efforts to penetrate the U.N. defense perimeter around the port of Hungnam.

**18 General Motors Corp.** halted the sale by its dealers of 1951 Chevrolet, Pontiac and Cadillac automobiles.

**Foreign** and defense ministers of the North Atlantic treaty powers voted to establish an integrated armed force for the defense of western Europe in which western Germany would participate.

**19 Gen. of the Army Dwight D. Eisenhower** was named commander in chief of Allied forces in Europe by the North Atlantic council.

**Robert M. Hutchins** resigned as chancellor of the University of Chicago, effective June 30, 1951, to become associate director of the Ford foundation.

**Economic Stabilization agency** requested voluntary observation of price ceilings that would hold prices to the 1946-49 average and consumer prices to the level prevailing on Dec. 1, 1950.

**20 Bill** extending federal rent control to March 31, 1951, was signed by Pres. Truman.

**Former Pres. Herbert C. Hoover** urged the U.S. to concentrate on the preservation of the western hemisphere by holding the Atlantic and Pacific oceans with the islands of Britain, Japan, Formosa and the Philippines.

**1950-51 edition** of *Jane's Fighting Ships* published in London reported that the U.S.S.R. had 350 submarines in active service, 120 under construction and 1,000 in the planning stage.

**21 John R. Steelman** announced settlement of wage disputes of railroad operating unions by a 3-yr. no strike contract giving substantial wage increases and embodying a wage escalator clause.

**22 6 soviet-designed jet fighter planes** were shot down near the Manchurian border by U.S. jet fighters.

**Communist China** denounced the U.N. truce committee as illegal and said it would not negotiate with it.

**Economic Stabilization agency** ordered all wages frozen in the new passenger car industry until March 1, 1951.

**U.S., the U.K. and France** rejected a soviet proposal for a joint conference on Germany in similar notes which stated that any conference should cover all disputes.

**23 Lieut. Gen. Walton H. Walker**, commander of U.S. 8th army, was killed in a jeep accident in Korea; Lieut. Gen. Matthew B. Ridgway, deputy chief of army staff in Washington, D.C., succeeded him.

## DECEMBER—Continued

**Pope Pius XII** confirmed that the tomb of St. Peter had been discovered beneath St. Peter's basilica in Rome.

**24 Defense dept.** announced in Washington, D.C., that evacuation of U.N. forces from the Hungnam beachhead in northeast Korea had been successfully completed.

**25 Tibet's ruler**, the dalai lama, was reported to be fleeing southward by caravan from Lhasa, the capital.

**Stone of Scone**, symbol of the union of the English and Scottish thrones, was stolen from Westminster abbey in London.

**26 U.N. forces** in Korea were unified under the command

of Lieut. Gen. Matthew B. Ridgway, theretofore commander of only the 8th army.

**27 Pres. Truman** announced the appointment of Stanton Griffis as the first U.S. ambassador to Spain since 1945.

**Gen. MacArthur's headquarters** in Tokyo estimated that a force of almost 450,000 Chinese and North Korean Communist troops had been built up in Korea.

**U.S. Steel Corp.** announced plans for construction of a huge integrated steel plant near Morrisville, Pa., to cost \$400,000,000 and with annual capacity of 1,800,000 tons of steel.

**French forces** in Indochina reported the recapture from Việt-Minh forces of Daphuc, a fortress 27 mi. N.W. of Hanoi.

**28 U.S. government** took over control of the importation and distribution of natural rubber.

**Chinese Communist government** decreed the seizure of all U.S. property and the freezing of all U.S. public and private bank deposits in China.

**U.N. forces** withdrew their left flank to a point about 28 mi. N. of Seoul, giving up the town of Kaesong.

**29 Communist forces** launched heavy attacks on the right flank of U.N. forces in Korea below the 38th parallel.

**General chairmen** of the Brotherhood of Locomotive Engineers rejected proposed 3-yr. pact for settlement of disputes between the railroads and 4 operating unions.

**30 Secy. of State Acheson** pledged that the U.S. would stand with its allies and redouble its efforts to strengthen the military defenses of the western powers.

**Counterattacking U.N. forces** made minor gains on their right flank in Korea.

**31 Premier René Plevin** of France received a vote of confidence of 314 to 223 in the national assembly on his rearmament and taxation program.

**Communist forces** were reported massing for attack all along the 140-mi. U.N. defense line at the 38th parallel in Korea.

**Gen. MacArthur** suggested in annual New Year's message to Japanese people that, if international lawlessness continued, it would be their duty to rearm.

**BUSHMAN**, the largest and most celebrated gorilla in captivity before his death of a heart attack on Jan. 1, 1951. The 22-year-old animal was more than six feet tall and weighed 550 lb. He is shown at his home in the Lincoln Park zoo, Chicago, Ill.

## BOOK OF THE YEAR

**Abyssinia:** *see* ETHIOPIA.

**Academy of Arts and Letters, American:** *see* SOCIETIES AND ASSOCIATIONS.

**Academy of Political and Social Science, American:** *see* SOCIETIES AND ASSOCIATIONS.

**Accident Insurance:** *see* INSURANCE.

**Accident Prevention.** Accidents caused 91,000 deaths in the United States in 1949. This total was exceeded only by deaths from heart disease, cancer and cerebral haemorrhage. Information available through Oct. 1950 indicated that the 1950 accidental death total would probably drop slightly below that of 1949. In addition to the deaths, accidents in 1950 also caused about 9,000,000 nonfatal injuries.

Organized efforts to reduce accidents in the United States are spearheaded by the National Safety council and affiliated local safety councils throughout the nation. Safety work is constantly carried on by industries and by a large number of organizations, both governmental and private, operating in their various spheres of activity, such as industry, traffic, the school, the home, the farm, etc.

Serving as a place for group planning and execution by all who take part in the safety movement, the National Safety council attempts to discover the facts of accident occurrence; to devise or help devise engineering, educational and enforcement measures for prevention; assists in determining engineering requirements for the safe design, construction and use of machines and equipment; helps formulate model safety legislation; participates in planning and executing training and educational programs; disseminates this information widely to interested groups and to the general public; and encourages and assists the estab-

lishment and functioning of community and state safety organizations.

**Industrial Safety.**—Building on about 40 years of experience in preventing work accidents, the country's progressive industries continued to pursue thoroughgoing safety measures in 1950, recognizing accident prevention as an important element in efficient operation.

Trade associations and other employer groups emphasized accident prevention programs in their meetings and publications. Labour organizations recognized accident prevention efforts as an important element in serving their members. Governmental agencies, such as state and national labour departments, also carried on safety programs as important parts of their operations.

An industrial safety highlight of 1950 was the president's conference on industrial safety, when 1,500 representatives of management, labour, government and the public met in Washington, D.C., in June to consider committee reports and to develop plans for the reduction of the industrial accident toll.

It appeared, late in 1950, that the year's toll of occupational accident fatalities might have been a little greater than the 1949 toll of 15,000.

**Traffic Safety.**—As 1950 drew to a close, it appeared that the number of traffic accident deaths would be close to 35,000—the largest annual total since 1941. This increase in deaths was apparently matched by the increase in miles travelled by motor vehicles.

In May 1950 key committee members of the president's highway safety conference met in Chicago, Ill., to appraise progress and plan goals for further achievement.

In the 1949 National Traffic Safety contest, which takes ac-

count of good traffic safety records as well as sound programs in all phases of traffic safety, Connecticut received the grand award among states, while Oklahoma City, Okla., and Lansing, Mich., shared the grand award among cities. Connecticut also received top place among states in the 1949 Pedestrian Protection contest; San Francisco, Calif., was the winner in cities of more than 100,000 population and Laurens, S.C., among cities of less than 100,000. Awards for outstanding performance in traffic law enforcement in 1949 were granted, among the states, to Delaware, Connecticut, Virginia, Oklahoma, Washington and Pennsylvania. City winners, in various population groups, were: Washington, D.C.; Los Angeles, Calif.; Minneapolis, Minn.; Oklahoma City, Okla.; Evansville, Ind.; Lansing, Mich.; Oak Ridge, Tenn.; Richland, Wash.; and Peru, Ind. Awards for outstanding traffic engineering were given to Connecticut, Virginia, Minnesota, Utah, Michigan and Massachusetts among states, and to Detroit, Mich., Washington, D.C., Pittsburgh, Pa., Syracuse, N.Y., Arlington, Va., Evanston, Ill., Burlington, Ia., Cleveland, O., Fresno, Calif., and Wilmette, Ill., among cities.

**Farm Safety.**—Recognition of the seriousness of the farm accident problem is indicated by the fact that in 1950, 24 states had state farm safety committees, and 12 states had a full-time farm safety specialist, working through many public and private agencies to spread information on the seriousness of the farm accident problem, and ways and means of meeting it.

The president of the United States, for the seventh successive year, proclaimed a National Farm Safety week in July 1950, which brought about unprecedented attention to the problem of rural accidents. More than 1,100,000 pieces of educational material were distributed, and radio, newspaper and magazine support were outstanding.

**School and Child Safety.**—Among children 1 to 14 years of age accidents are responsible for more deaths than the next six death causes combined. Even so, the accidental death rate among children under 14 had dropped nearly 50% in the last 45 years.

School authorities showed increasing recognition during 1950 of the importance of safety education, in the classroom, in shops and in other parts of the school program.

A specialized feature of school safety work had been the driver training programs instituted in many high schools throughout the nation. Studies had shown that students who had this training were involved in fewer accidents than those who had not.

**Home Safety.**—The 1949 toll of deaths in home accidents was 31,000, about the same as that for motor vehicles. Ten months' reports for 1950 indicated that home fatalities were less numerous than in 1949. It appeared that the year's total might have been less than 30,000.

Activity in home safety during 1950 consisted in large part of improved and expanded safety education of people generally, both through the general media of public information and specific instructional material. In the latter field, a special kit of home safety materials was produced and made available for use in many communities.

Local and state health departments gave increased attention to accident prevention work, concentrating on home safety. Women's clubs and other organizations and agencies attracting the support and interest of homemakers showed an increasing tendency to include safety in the home as a regular program activity.

**Community and State Safety Organizations.**—Community and state safety organizations serve in their respective areas to provide leadership in a co-operative effort among all groups and individuals working together for the conduct of safety activities. Control of accidents in any community involves the joint efforts of traffic enforcement and engineering authorities, public in-

WELDER'S FACE PIECE developed by the Mine Safety Appliances Co. of Pittsburgh, Pa., in 1950. It was designed to protect welders from asphyxiation and ultra-violet and infra-red radiation while doing repair work on tanks and other equipment in plants where toxic materials are stored

formation media of various kinds, industry, labour, service groups and many others. It is the function of the local safety council to harmonize and co-ordinate these and other safety activities.

During 1950 about 85 of the several hundred local and state safety organizations throughout the country qualified for acceptance as chapters of the National Safety council, this relationship signifying that these organizations fully represented the National Safety council in the communities in which they operated, although at the same time retaining their own autonomy.

**Safety Meetings.**—The 38th National Safety congress was held in Chicago in Oct. 1950, with an attendance of approximately 12,000. In addition, about 30 regional safety conferences were held during the year. These meetings brought about an exchange of information, plans and programs among leaders in all fields of safety.

(R. L. Fo.)

**Canada.**—The dominion bureau of statistics revealed that Canada's 1949 automobile accident rate reached the all-time high of 44 killed and 843 injured per week. The provincial department of highways in Ontario, Quebec and Manitoba distributed drivers' handbooks to make car owners safety conscious. Saskatchewan added written aptitude tests to oral examinations for drivers' licences and strengthened the careless driving clause in the vehicles act; Manitoba tightened up its drivers' tests and appointed a director of highway safety; Ontario increased penalties for drunken driving, gave special driving and sight tests to drivers involved in fatal accidents and encouraged intramural driving instruction for school children 15 years of age and over.

During the first half of 1950, there were 573 fatal industrial accidents, 55 more than for the same 1949 period. Manufactur-

ing and mining were responsible for most deaths.

Parliament amended the railway act to increase the annual grant to the grade-crossing fund from \$500,000 to \$1,000,000 for six consecutive years beginning April 1, 1951. (C. V.)

**Great Britain.—Road Safety.**—The year 1950 was dedicated to child safety. A campaign was launched on Holy Innocents' day, Dec. 28, 1949. The ministries of transport and education urged local authorities to co-operate in a National Children's Safety week in March. For the whole year, despite the increase in accidents which was bound to occur with the return of unrationed gasoline, the increase in child accidents was much smaller than in the case of adults.

About 250,000 commercial transport drivers were entered in the annual safe driving competition sponsored by the Royal Society for the Prevention of Accidents; 121,595 awards of silver and gold medals and diplomas were presented. Eight hundred London Transport drivers qualified for awards for 20 years or more of safe driving, totalling among them 16,000 "safe" years and 3,111,000,000 miles in safety.

The society's annual National Safety congress held in October in London was attended by more than 1,000 delegates. Proposals from accident-prevention federations all over the country were discussed.

The minister of transport said that 156,516 persons were killed in road accidents from Jan. 1, 1926 to June 30, 1950; excluding 1939-41, for which years figures were not available, 3,795,258 persons were injured.

**Industrial Safety.**—Two new volumes in the series "I.C.I. Engineering Codes and Regulations (Safety Series)" entitled *Portable and Transportable Plant and Equipment and Buildings and Structures (Design)*, were issued by the Royal Society for the Prevention of Accidents.

Accident prevention and working conditions in iron foundries were discussed in the house of commons in June. New requirements for seating in factories came into force on Oct. 1. Under these, all employees who have reasonable opportunities to sit without detriment to their work must be given facilities to do so: where they can do a substantial proportion of any work sitting, the employees must be given work seats and, where necessary, footrests.

In his annual report for 1948, published in 1950, the chief inspector of factories, G. P. Barnett, reported an increase in fatalities but a decrease in the total number of accidents. The number of accidents per 1,000 workers had also steadily declined, from 40 in 1944 to 28 in 1948. (See also DEATH STATISTICS; DISASTERS; INDUSTRIAL HEALTH.)

**FILMS OF 1950.**—*Accident Behavior* (Progressive Pictures); *America's Traffic Problem* (March of Time Forum Films); *Bicycle Safety* (Young America Films, Inc.); *Last Date* (Modern Talking Pictures Service, Inc.); *Safe as You Think* (The Jam Handy Organization). (H. I. S.)

**Acheson, Dean Gooderham** (1893— ), U.S. secretary of state, was born on April 11 in Middletown, Conn., attended the Groton school, was graduated from Yale in 1915 and from Harvard law school in 1918. After serving in the navy in World War I he was for two years private secretary to Louis Brandeis, associate justice of the U.S. supreme court. He then engaged in law practice, and in 1933 served for six months as undersecretary of the treasury. In 1941 he became assistant secretary of state and was undersecretary of state from Aug. 16, 1945, to June 30, 1947. On Jan. 7, 1949, Pres. Harry S. Truman appointed him secretary of state, and he was sworn in on Jan. 21, 1949.

During 1950 Secretary Acheson was perhaps the most controversial figure in U.S. public life, the target of repeated attacks in congress, and just as repeatedly won new affirmations from President Truman that he would not, as his critics were de-

manding, be asked to resign. When the North Koreans invaded South Korea in May, he was violently attacked on grounds that his far eastern policy had proved itself a failure. Sen. Joseph McCarthy (Republican, Wis.) especially demanded that Acheson be "fired" for abandoning the far east to communism. On July 18, he was awarded the Freedom house 1950 freedom award for his efforts "to mobilize the free world for peace."

After the conferences between President Truman and British Prime Minister Clement Attlee in Washington, D.C., in December, the violence of the attack on Acheson and his policies eased somewhat as certain Republican leaders, notably Thomas E. Dewey, urged that the nation should become unified in its policies toward communism, and that the attacks on the Truman-Acheson far eastern policy should end.

**ACTH:** see ALLERGY; ARTHRITIS; BIOCHEMISTRY; CHEMOTHERAPY; ENDOCRINOLOGY; HEART AND HEART DISEASES; INTOXICATION, ALCOHOLIC; MEDICINE; PHYSIOLOGY.

**Aden.** British colony and protectorates on the southern coast of Arabia (*q.v.*). Colony area: 80 sq.mi. Pop. (1949 est.) 82,000. Protectorate area: c. 112,000 sq.mi. Pop. (1949 est.) 650,000, almost entirely Moslem Arabs. Governor, 1950: Sir Reginald Stuart Champion.

**History.**—After recurrent border difficulties with the Yemeni a conference was held in London in Sept. 1950 with Yemeni representatives. Agreed proposals were submitted by the delegates to their respective governments.

Development plans made for the colony covered the extension of medical and educational services, including female education, an Aden college and a technical institute; the institute was opened toward the end of the year. Two-thirds of a scheme costing £250,000 to irrigate 60,000 ac. for rice growing in the Abyan district of the protectorates was completed.

**Finance.**—Budget estimates 1950-51: revenue Rs. 128,036,859; expenditure Rs. 173,028,572. Currency: Indian rupee (R. 1 = 21 cents U.S.).

**Trade.**—Imports (1949), Rs. 328,953,002; exports (1949), including re-exports, Rs. 203,961,079.

**BIBLIOGRAPHY.**—Doreen Ingrams, *A Survey of Social and Economic Conditions in the Aden Protectorate* (Asmara, 1950); The Master of Belhaven, *The Kingdom of Melchior* (London, 1950). (K. G. B.)

**Adenauer, Konrad** (1876— ), German government official, was born at Cologne, Jan. 5. Following a university education at Freiburg-in-Breisgau, Munich and Bonn, and three years as a lawyer, he was in 1906 elected town councillor in his native city. Eleven years later he was elected *Oberbürgermeister* (lord mayor) of Cologne, an office which he held uninterruptedly for 16 years. From 1917 to 1933 he was a member of the Prussian *landtag* and in 1928-33 was its speaker. During World War II he was detained for a time in Brauweiler concentration camp. In Feb. 1946 he was elected chairman of the Christian Democratic union in North Rhine-Westphalia, and on Sept. 1, 1948, was elected president of the parliamentary council drafting the West German constitution. On Sept. 15, 1949, after the elections to the *bundestag* of the new west German republic had given the C.D.U. the largest number of seats, Adenauer was appointed chancellor. In a speech at Dortmund on May 13, 1950, he described the Schuman plan for a European coal and steel pool as an act of historic significance and emphasized that Germany would co-operate with the aim of burying the hatchet for all time between France and Germany. Addressing the first annual congress of the Christian Democratic union at Goslar, on Oct. 20, he said that Germany belonged to the west and would never accept soviet slavery.

**Adult Education:** see EDUCATION; LIBRARIES.

**Advertising.** The year 1950 in advertising was marked in the United States by greater total expenditures than in 1949, by the spectacular growth of television as an advertising medium, and by the effects of the mobilization economy into which the country was entering.

Total advertising expenditures were approximately \$5,700,000,000, an increase of \$500,000,000 over 1949. Expenditures among the various media were as shown in the table.

*Advertising Expenditures in the United States*

	(Millions of Dollars)	1950*	1949
Newspapers . . . . .		\$2,059.0	\$1,905.0
Radio . . . . .		658.0	633.8
Magazines . . . . .		517.0	492.5
Farm papers . . . . .		22.1	20.5
Direct mail . . . . .		838.7	755.6
Business papers . . . . .		248.0	248.1
Outdoor . . . . .		140.7	131.0
Television . . . . .		161.6	63.0
Miscellaneous . . . . .		1,039.6	952.7
<b>Total . . . . .</b>		<b>\$5,684.7</b>	<b>\$5,202.2</b>

\*Estimates by Robert Coen, McCann-Erickson, Inc.

Advertising executives predicted at the year's end that appropriations during the first half of 1951, at least, would equal or exceed those for the same period of 1950. A survey taken by the Association of National Advertisers in the fall of 1950 showed that 35% of the 141 companies questioned planned larger appropriations in 1951, while most of the rest said they would maintain 1950 levels.

**Television.**—The outstanding development in advertising media in 1950 was the swift growth of television. In 1950 manufacturers made some 7,500,000 sets, compared with 3,000,000 in 1949, and at the end of the year there were close to 10,000,000 sets in operation in the United States, compared with 3,950,000 at the end of the previous year. There were 107 television stations operating in 65 markets as the year closed, only 11 having been added during the year because of the temporary prohibition placed by the Federal Communications commission on new construction.

This prohibition resulted from an original allocation plan that produced overcrowding of stations and intolerable interference. Some 351 applications for construction of new stations were pending. There were some 2,000,000 television sets in metropolitan New York city alone, viewed by approximately 8,000,000 persons. Coast-to-coast television transmission was expected to be ready late in 1951. Plans for extension of a radio-relay system from Omaha to San Francisco were well advanced.

Advertisers in 1950 were spending approximately \$100,000,000 for television time, or about four times their expenditure in 1949. However, both advertisers and advertising agencies were beset by soaring time and talent costs. Television network charges were running well above radio network charges, in spite of the fact that the total available television audience was only a fourth of that of radio. Rate cards of one network, as of Jan. 1, 1951, quoted \$20,630 per half-hour for television against \$16,600 for radio. Current prices set a base of approximately \$1,250,000 for a major effort in television.

The industry was disturbed during the year by a controversy over colour. The Federal Communications commission in September gave the Columbia Broadcasting system colour method its tentative approval and on Oct. 11 announced its final approval, with colour casts due to begin on Nov. 20. However, the Radio Corporation of America, developer of a rival system of colour television, secured a temporary restraining order from a federal court in Chicago. The court upheld the commission's decision, but continued the restraining order till April 1, 1951, to

**NEWSPAPER ADVERTISING** (total linage in 52 cities of the United States): average per month. Compiled by Media Records, Inc.

give Radio Corporation of America time to appeal.

The prospect of colour confused prospective buyers of sets capable of receiving only black-and-white transmissions. Sales slumped, but revived toward the end of the year as the public realized that colour would be some time in coming and black-and-white would be harder to get because of war restrictions.

As the year ended, both the television and radio industries were preparing to devote half their facilities to production of electronics equipment for the national defense. The television industry expected to have to cut back its production to 3,500,000 receivers or less in 1951 because of government restrictions on critical materials, such as cobalt and copper. It was thought that progress would be made during 1951 in improvement of colour television techniques, although comprehensive colour set production would be impossible. (See also **FEDERAL COMMUNICATIONS COMMISSION; TELEVISION.**)

**Radio.**—Total gross revenue of radio advertising in 1950 was approximately \$448,000,000, an increase of 5.4% over 1949. Network time sales declined 3.3%, but this loss was offset by gains in spot and local radio advertising.

Radio continued to grow, in spite of its competition from television. Radio manufacturers produced 14,000,000 sets during the year, the third largest output in the history of the industry, with a gross dollar volume of \$1,700,000,000, the highest in peacetime history. There were 2,230 stations on the air at the end of the year compared with 2,087 at the end of 1949. The number of FM broadcasters was 676, compared with 744 in 1949.

Radio was on the defensive from advertisers during the first half of the year, but the Korean war and its stimulus to radio listening, determined efforts to improve programs and aggressive selling helped to improve the industry's position. The Association of National Advertisers made a report on radio and television costs, and called for substantial reductions in night radio rates because of the losses of that audience to television. Late in the year the National Broadcasting company asked its stations in television areas to make cuts of some 10% in their rates in view of the altered values of network radio in cities where television viewing by families with radios had become an important factor.

(See also **RADIO.**)

**Newspapers.**—Newspapers in 1950 enjoyed record advertising volume and circulation. The Bureau of Advertising of the American Newspaper Publishers' association estimated that national advertising in 1950 would be larger than the \$445,000,000

for 1949 and would constitute the third record-breaking year in a row in this respect. Media Records estimates for the first ten months of the year showed that national advertising (general and automotive) was 9.9% greater than during the corresponding period of 1949. Circulation was also more than holding its own, stimulated by the Korean war news. Representative papers in large cities showed gains of from 6% to 15%.

Although the line rate for advertising in daily newspapers increased 50% in the period 1940-50, the milline rate, or the cost of reaching a reader, rose only slightly, according to a study by the Kelly-Smith company. The average milline rate for all newspapers, Sunday papers excepted, was given as \$3.32 in 1940 and \$3.41 in 1950.

The U.S. department of commerce estimated that consumption of newsprint would reach a new high of 5,700,000 tons in 1950, topping the previous year's record of 5,517,000 by nearly 4%. The Canadian mills, which supply 80% of the needs of the United States, produced 23,410 more tons for the first eight months of 1950 than for the same period of 1949. There was a general increase in the price of newsprint from \$100 to \$106 a ton.

There were general advertising rate increases among newspapers, as among other printed media. More than half of the newspapers raising their rates merely announced new schedules and gave no reasons. The volume of rate increases by media was characterized by the Standard Rate & Data service as the heaviest in 25 years.

The *New York Times* increased its daily newsstand price to 5 cents, its Sunday edition to 15 cents. The *New York Herald Tribune* brought out an 8 P.M. "early bird" edition. The *World-Telegram* and *The Sun* in New York missed publication for ten weeks beginning in June because of a strike, and a strike also closed down three daily newspapers in Pittsburgh for six weeks. In Birmingham, Ala., the *Post* and the *Herald* were merged into the *Post-Herald*, and in Atlanta, Ga., the *Constitution* and *Journal* were combined so that the editorial integrity of each was preserved, a combined paper being published on Sundays.

**Magazines.**—The Magazine Advertising bureau predicted a national advertising volume of between \$470,000,000 and \$475,000,000 for 1950, compared with \$445,000,000 in 1949 and \$463,000,000 in 1948. The first half of 1950 showed total circulation of 146,579,475 for all general and farm magazines reporting to the Audit Bureau of Circulations. This was 3,000,000 more than for the second half of 1949 and 4,000,000 more than for the first half of that year.

The committee on advertising of the United States Chamber of Commerce conducted late in the year a survey among advertising managers of 46 national publications. It found that 67% had raised advertising rates during the first three-quarters of the year by an average of 11%; that advertising lineage was up an average of 15% for 61% of the respondents, down an average of 8% for 39%; that no inroads from television were observed by 60%, but that 40% said that there were effects of television competition noted in securing new advertising accounts. Practically all reported circulation increases.

War and mobilization stimulated the circulation of news magazines. *Quick*, one of these, passed 1,000,000 in circulation and began to take advertising. *Flair*, also published by Cowles Magazines, Inc., suspended after less than a year of publication, giving as the reason a prospective increase of 35% in production costs and curtailment of paper supply. *Harper's* celebrated its rooth birthday and two new magazines to be distributed through supermarkets were announced, *Better Living* and *Everywoman's*. (See also NEWSPAPERS AND MAGAZINES.)

**Other Media.**—Circulation of 18,000,000,000 passengers was estimated for advertising in the 90,000 vehicles carrying car cards. There were 80 transportation companies, with about 75%

of the business being done by a dozen. Greater use of fluorescent inks was noted in travelling displays, a form of transportation advertising used on the outside of buses and trolley cars.

The volume of national outdoor advertising was somewhat more than \$80,000,000, according to Outdoor Advertising, Inc. The volume of local advertising was estimated at approximately a third of the national figure. It was estimated that national advertising was divided as follows: automotive (automobiles, gasoline and oil, tires and accessories) 38% of dollar volume; beverages (soft drinks, beer, wine, liquor) 29%; food of all kinds 19%; other products (cigarettes, appliances, etc.) 14%.

The dollar volume of direct mail advertising set a new peak for the year in October, according to estimates from the Direct Mail Advertising association. The total for October was \$80,223,785, an increase of 9% over the September volume and 0.5% above that of March, the previous high month. For the first ten months of 1950 the dollar volume was \$726,357,050.

In the field of business publications there was no resolution of the debate between the publications with paid and those with free circulations, essentially over the question of whether both the free and the paid portions of the circulations of publications which were members of the Audit Bureau of Circulations should be audited by that body, as the paid portion had always been audited. The bureau decided that business publications could take up to three years in converting from 50% to 70% paid circulation in their quest for regular membership. A publication with paid circulation was defined to be "one of which 70% or more of the total distribution during a regular six-months' publisher's statement period qualified as net paid under the standards of the bureau."

Industrial advertisers and agencies were thrown into some

ROADSIDE BILLBOARD near the ruins of Cassino, Italy. Thousands of these outdoor signs dotted the Italian highways in 1950 where formerly they were very rare

OUTDOOR POSTER prepared by William Strasser of the J. Walter Thompson Co., advertising agency; it was awarded the Kerwin H. Fulton medal in 1950 by the Art Directors Club of New York

confusion by the Korean war. Many of them had just become organized for extensive advertising and selling campaigns following the mid-year recession in 1949, when the Korean crisis developed and with it a rush of orders for industrial goods. The National Industrial Advertisers association set in motion a project to evaluate inquiries and their proper follow-up and to make a thorough study of industrial catalogues. The National Machine Tool Builders association set up an advertising committee to promote the desirability of machine replacements.

Business publications raised advertising rates generally. A study of a group of 75 such increases showed that 12 were based upon gains in circulation, 31 upon higher publishing costs. The others gave no reasons for increases.

**Agencies.**—The year was marked by mergers among advertising agencies. In some cases these mergers occurred among agencies that needed new facilities and working capital and found them in such consolidations. Some agencies that were established immediately after World War II went out of business; on the other hand many agencies expanded their space and personnel. There was a tendency for large agencies to become larger.

There was no agitation in the United States for any revision in the standard 15% agency commission, but in Canada the Association of Canadian Advertisers rejected a request by the Canadian Association of Advertising Agencies for an increase in agency commissions to 17%, declaring that any such change would be a disservice to advertising generally.

**Advertising in Other Countries.**—British advertisers reported a lower cost per inquiry than before World War II largely because the circulation of printed media had risen more proportionately than advertising rates. Other factors that contributed to greater effectiveness were the lessened competition among advertisements because of the smaller number faced by restrictions on space, and the increased readership of newspaper and magazines. Some of the best women's magazines had a waiting list for subscribers, and there was widespread passing on of such magazines from family to family. Data released during the year showed the increase in circulations of the British press since before the war. The British public spent £64,000,000 on newspapers in 1949, compared with £36,000,000 in 1938, and £39,000,000 on magazines in 1949 compared with £18,000,000 in 1938. According to the *Advertiser's Weekly*, the increases were approximately in proportion to the increases in spending on consumer goods and services.

In France advertisers were making use of Radio Luxembourg and Radio Monte Carlo to reach the 10,000,000 radio sets in use

in France. No advertising is permitted on the government-controlled radio in that country. There were 3,000 to 3,500 newspapers and magazines published in France, but 150 of the Paris and provincial dailies and 80 consumer magazines carried the bulk of the advertising.

**Aeronautics:** see AVIATION, CIVIL; AVIATION, MILITARY.

**Afghanistan.** An independent kingdom in the centre of Asia, Afghanistan is bounded N. by the U.S.S.R., W. by Iran, S. and S.E. by Pakistan and E. by China (Sinkiang). Area: c. 270,000 sq.mi. Pop. (no census ever taken; 1949 est.): 12,000,000. Language: Pashtu and Persian. Religion: Moslem. Chief towns (pop. 1946 est.): Kabul (cap., 206,200); Kandahar (77,200); Herat (75,600); Mazar-i-Sharif (41,900). King, Mohammed Zahir Shah; prime minister, Shah Mahmud Khan, the king's uncle.

**History.**—The year 1950 began auspiciously by the signature on Jan. 4 at New Delhi, India, of a treaty of friendship with India. The treaty provided that each signatory should be able to establish trade agencies in the other's territory. It would last for five years in the first instance, and at the end of that period it would be terminable at six months' notice.

This friendship with India did not find reflection in Afghanistan's relations with Pakistan. Pakistan felt that Afghanistan was too tolerant of the so-called independent "Pashtunistan" movement, which had for its aim the creation of a Pashtu-speaking enclave and therefore a new state to be carved out of what was Pakistan territory. In September disturbances were caused by an apparent invasion of Pakistan near the Bogra pass. The Afghan government promptly denied that the invaders had comprised Afghan troops. The prime minister of Pakistan, Liaquat Ali Khan (q.v.), in disclosing that a protest had been sent to Kabul on what he described as the culminating incident in a number of minor frontier violations, declared that Pakistan was willing to discuss economic and cultural questions of common concern to the two countries. He nevertheless deprecated any action which might disturb the peace of the strategic frontier area.

With Egypt, Saudi Arabia and Iran, Afghanistan developed closer relations during the year. Relations with the U.S.S.R. were naturally of much importance to Afghanistan. The conclusion

in Moscow in July of a four-year trade agreement was taken as a favourable sign in that regard. (E. Hd.)

**Education.**—(1948) Schools: primary 400, secondary 25, higher (*lycees*) 7, teachers' training colleges 2, a university at Kabul with four faculties.

**Finance and Banking.**—Revenue estimated at 220,000,000 afghanis. Note circulation (April 1950) 800,000,000 afghanis. Monetary unit: afghani, which under exchange rates existing in Nov. 1950 was worth 5.96 cents U.S.

**Foreign Trade.**—Principal imports (1949): textiles, china, gasoline (4,500,000 gal.), cement (18,100 metric tons), machinery, tea, coffee and cocoa. Principal exports (1949–50): opium, karakul skins (\$8,700,000) and carpets.

**Communications.**—Roads (1949): 2,265 mi. Licensed motor vehicles (Dec. 1949): cars 630, commercial 3,650. Telephone subscribers (Jan. 1949): 3,899.

**Agriculture.**—Production (metric tons): cotton (1949) 13,600; sugar beets (1949–50) 32,000; wool (1949) 8,000. Livestock (Jan. 1948): cattle 3,000,000; sheep 14,000,000; goats 6,000,000; camels 350,000; horses 700,000.

**Industry.**—Coal (metric tons, 1949) 5,500. Raw materials (1949): chrome ore (metric tons) 907; salt (metric tons) 5,443; skins and hides 7,250,000.

## Agricultural Research Administration.

The Agricultural Research administration, established in 1942, supervises and directs most of the scientific research in the U.S. department of agriculture. The research administrator also administers the Research and Marketing act, which provides for a greatly expanded program of agricultural research and services in which the U.S. department of agriculture, state experiment stations, extension services and departments of agriculture, and other public and private agencies co-operate.

Some examples of the results of ARA research in 1950 follow:

Three new pieces of cotton-processing equipment were developed by the bureau of agricultural and industrial chemistry that were of interest to the textile industry. One was a simple and efficient loom attachment for weaving fabrics of greater density; the second was an entirely new type of slasher, a machine used to apply sizing to cotton yarns to strengthen them for weaving; and the third was a machine for opening cotton in a textile mill to aid in cleaning.

A laboratory method was devised for the detection of poor milling qualities of wheat that required only six grams of grain for the test, as compared with five pounds for conventional milling tests.

A new process was developed for giving maple syrup intensified maple flavour and colour. One part of this high-flavoured syrup diluted with three parts of cane-sugar syrup made a maple-syrup blend with a flavour hardly distinguishable from that of commercial maple syrup.

A simple treatment that made cotton clothes harder to soil and easier to launder was developed by the Institute of Textile Technology under contract with the bureau. The treatment consisted of adding a small amount of a commercial compound (carboxymethyl cellulose), having the trade name CMC, to the final rinse water each time cotton goods were washed. The effect on the finish was much like that of ordinary starch, but CMC could be applied in quantities that later prevented soiling and made the cloth clean easily without making the fabric noticeably stiff.

In poultry feeding studies, the bureau of animal industry found that aureomycin, a by-product in the manufacture of vita-

min B<sub>12</sub>, stimulated more rapid growth in chickens than did vitamin B<sub>12</sub> alone. The tests also showed that the effect of a combination of vitamin B<sub>12</sub>, aureomycin and an organic arsenic compound was greater than the effect of any two.

A portable pen 5 ft. by 10 ft. by 3 ft. in size was found to be of value in controlling coccidiosis and other diseases in dairy calves. Dairymen using the pens reported calf losses of less than 10% on farms where the losses had been as much as 75% prior to their use.

Two new inbred strains of swine at Beltsville, Md.—the Landrace X Chester White and the Landrace X Poland China—continued to show improvement in their yield of preferred cuts. For the former the yield was 49.7% of the total slaughter weight, and for the latter, 49.5%.

Meat studies at the bureau's field station at Miles City, Mont., showed that important carcass and meat characteristics of cattle are considerably influenced by breeding. For example, relatively wide variations in dressing percentage, commercial grade, fatness and muscling were found among the steer progeny groups representing 13 Hereford sires. These cattle had all been produced under the same conditions of feeding and management, yet the average dressing percentages ranged from 56.7% to 58.7%; and as slaughter cattle one group was low good in grade, five were good and seven were high good. As dressed carcasses, six groups were low good, seven were good and none were high good.

Preliminary experiments showed pellets made of artificially dried alfalfa hay to be a better means of providing good roughage and an adequate amount of carotene (provitamin A) for young calves than average field-cured hay. The pelleted hay was consumed at earlier ages and in greater quantities, produced greater gains in live weight and maintained higher levels of carotene and vitamin A in the blood plasma.

Scientists in the bureau of entomology and plant quarantine found a potent new insecticidal chemical in the roots of a common native perennial weed. The new chemical, an amide called scabrin, was derived by extracting the active principal from plants of the genus *Heliopsis* (commonly known as oxeye). Early trials showed it to be appreciably more toxic to houseflies than pyrethrum, the standard of comparison in laboratory tests.

A new method of insect control appeared promising from experiments with new chemicals that make plants toxic to insects for short periods and then break down into harmless substances. The chemicals, known to entomologists as systemic poisons, were applied to the soil, the seed or to the foliage of plants. The treated plants absorbed the insecticides and distributed them to all parts through the sap.

The leaf hopper *Colladonus geminatus* (Van D.) was found to carry the virus that causes western X disease of peach. One leaf hopper, a greenish-yellow insect about one-fifth of an inch long, was enough to infect a healthy tree. It was found to feed on many different kinds of plants and was found frequently on peach and other fruit trees and on native shrubs. Federal-state co-operative experiments were started to see if the diseases caused by the western X virus could be prevented or retarded through the use of insecticides to kill the leaf hopper carriers.

A new method was announced for controlling green bugs, a major insect pest of small grains. Sprays or dusts containing parathion applied from aeroplanes or ground equipment were found to give excellent control in both cool and warm weather. Tetraethyl pyrophosphate sprays also were effective when the temperature was 75° F. or above. It was pointed out that these insecticides are highly poisonous to man and animals and must be handled with great care and only by persons experienced in handling and applying dangerous chemicals.

A publication, *Family Fare*, was issued by the bureau of hu-

man nutrition and home economics, which brought together up-to-date information for homemakers on nutrition, meal planning and food buying, storing and cooking. This 100-page bulletin, in addition to more than 200 recipes, included much information such as ways to substitute one ingredient for another, servings per pound of different foods and guidance on their nutritive value.

Nutritionally adequate food plans for institutional use were developed to help food managers of institutions maintain high standards. Plans were made at both low- and moderate-cost levels and were based on an analysis of the kinds and quantities of food which were being used by institutions of various types and modified for nutritional requirements, nutritive value of food and food prices. The plans were suitable for children's homes, dormitories and other institutions where the resident population is fairly constant and food needs are normal.

Spinning tests of cotton from new strains were providing the bureau of plant industry, soils and agricultural engineering with information that was revolutionizing cotton breeding. These tests had demonstrated that highest quality yarns came from fibres with unusual strength. Devices and techniques developed for measuring fibre strength promised to permit breeders to make selections of strong-fibred strains much earlier in the breeding program than had ever been possible before. The findings gave conclusive evidence that cottons with strong fibres can be substituted for long fibres in making strong yarns.

Tests with second-generation Johnson grass plants showed them to be twice as resistant to 2,4-D weed killer as those of the previous generation grown in soil treated with the chemical. As a result of these findings, it appeared that chemical weed control was another field in which agricultural science must always look for something new, just as it had to do in meeting the attacks of fungi and bacteria and in its fight on houseflies and mosquitoes showing resistance to DDT.

First information was reported on a blue pigment that holds the key to the mechanism which controls flowering and other phases of plant development. This important evidence was basic to further inquiry into the question of why some plants form flower buds only when the days are long and the nights short, and why others require short days and long nights to come into flower. The new findings were based on research in which a spectroscope was used to isolate narrow wave bands of light of high energy. The pigment was found to be present in extremely low concentrations—below the limit to impart colour.

A specially designed greenhouse was established for research in plants and soils with radioactive isotopes. Studies using radioactive phosphorus had already established basic facts showing how different crop plants make use of this element in varied types of soils. Among the first projects to be taken up were chemical analysis, phosphate fixation in soils and fundamental research on the soil biochemistry and plant physiology involved in lime-induced chlorosis (yellowing) of plants.

The office of experiment stations, as in former years, administered federal-grant research funds appropriated to state agricultural experiment stations. The chief also served as assistant administrator in charge of state relations. During the year a grand total of \$12,256,207 was distributed to the states, Alaska, Hawaii and Puerto Rico. The office reviewed and approved 910 new and revised research proposals; reviewed activities under 4,445 specific lines of research; reviewed all station expenditures of federal-grant funds; and approved the annual programs and budgets of proposed expenditures of these funds. The administration of the federal experiment station at Mayagüez, Puerto Rico, remained a further responsibility.

FILMS OF 1950.—*Yours Is the Land* (Encyclopædia Britannica Films Inc.). (P. V. C.)

**Agriculture.** For U.S. agriculture, 1950 was a bountiful year which differed from 1949 primarily in respect to reversed price trends and a sharply reoriented attitude toward production and supplies. Crop production was perhaps the third largest on record and exceeded the average for the most productive period in American agriculture. New record production was achieved in 1950 only in soybeans, sorghum grain, sugar beets and red clover seed, but several other crops were near record and rather uniformly large production gave an over-all result only 3% less than that of the previous year. Livestock numbers, particularly hogs and cattle, increased with the result that a 5% increased volume of production in the livestock sector did much to balance smaller crop production.

The price situation was the most favourable since the post-World War II peaks of 1948. There was no sharp break in February as in 1948 and 1949. A higher price trend, which began in the late winter, hesitated only slightly as bountiful crop and large livestock production came to market, then speeded up late in the year as the Korean situation worsened. By December the parity ratio (ratio of prices received by farmers to prices paid, interest, labour and taxes) had risen to 108, as compared with 95 a year earlier and an all-time record of 122 in Oct. 1946. The index of prices received by farmers stood at 286 in Dec. 1950, compared with 233 in Dec. 1949 and a record high of 306 in Jan. 1948; but the index of prices paid by farmers, including interest, labour and taxes, stood at a record 265, compared with 246 in Dec. 1949. On this last point the farmers' major worries were founded—necessary expenses of production were setting new record levels.

The volume of agricultural marketings, particularly of crops, was less than in 1949, but nevertheless was such as to provide a gross income to farmers of about \$31,800,000,000, compared with about \$32,000,000,000 in 1949 and \$35,300,000,000 in 1948. However, because of higher costs of production, the realized net income, which had been declining since 1947, in 1950 was estimated at only \$13,300,000,000, compared with \$14,000,000,000

"YES, WE HAVE NO POTATOES," cartoon comment by Fitzpatrick of the St. Louis Post-Dispatch on the huge surplus of U.S.-grown potatoes owned by the government in 1950 as a result of its price-support program

in 1949. Agricultural assets at the beginning of the year were estimated at \$127,096,000,000, almost the same as a year earlier and compared with \$53,805,000,000 in 1940. It was anticipated that assets at the end of 1950 stood at a new record high, partly because of increased value of real estate.

The world food situation continued to improve in 1950 as world crops continued favourable, war-damaged areas came back to something like pre-World War II production and surplus stocks of some major foods accumulated in exporting countries. Drought and famine were not prevalent in any large portion of the world, though the Danube basin, especially Yugoslavia, and some parts of China and India were having trouble. (See FOOD SUPPLY OF THE WORLD.)

\*Estimates by the U.S. department of agriculture; 1950 figures are preliminary.

**Crop Production.**—The aggregate volume of all 1950 crops in the U.S. declined to perhaps 132% of the 1935-39 base, compared with 146% in 1949 and with a record high volume of 152% in 1948. Food grains declined substantially to 144% of the base, compared with 166% in 1949 and the very high levels of 1947 and 1948; feed also declined relative to the record of 1949 but exceeded the levels of years prior to 1948. Cotton was the near failure of the year, dropping to 77% of the base as compared with 125% in 1949. Peaches were also very short. Soybeans were the prize crop of the year at 287,010,000 bu., about 56,000,000 bu. more than the previous (1949) record. Many other agricultural crops were near record levels of production. The total harvested acreage for the 52 principal crops amounted to only 341,036,000 ac. compared with 356,868,000 ac. in 1949. Yields per acre were above average for most crops; the composite yield index of 142% was second only to 151% in 1948 and approximately the same as in 1949. New high yield marks were set for rice, tobacco, potatoes and sweet potatoes.

GROSS FARM INCOME: net income and production expenses of U.S. farm operators, 1920-50, including government payments beginning in 1933. Compiled by the U.S. bureau of agricultural economics. Data on 1950 are tentative estimates

The eight major grains in 1949 produced a total tonnage of 158,400,000 or the fourth largest on record. The record was 180,500,000 tons in 1948. The food grains constituted 33,500,000 tons of the total, the smallest in seven years but larger than any total before 1944. The 1950 tonnage included an average wheat crop, the third largest rice crop, two-thirds of an average rye crop and the smallest buckwheat crop on record. The feed grain total of 125,000,000 tons represented the third largest on record, slightly less than in 1949 and a significant decline from the 138,000,000 tons of 1948; included were a large corn crop, the largest grain sorghum crop on record, the fourth largest oat crop and a less than average barley crop. In addition, a large 1950 hay crop, plus average carry-over, provided the most abundant hay supply per animal unit on record.

The oilseed crop of 1950 amounted to 14,700,000 tons, the third largest, only 6% below the record of 1949. Soybeans, a record crop, made up considerably more than half the total; peanuts were more abundant than in 1949 or average; flaxseed was 11% below 1949 but 13% above average; cottonseed was only two-thirds as abundant as in 1949 and one of the smaller crops on record.

A large sugar crop was harvested, including a record sugar beet tonnage; fruits and nuts produced a bountiful crop; the truck crops were the second largest on record and the tobacco crop the third largest.

Corn was planted later than usual, as a result of a late, cool, wet spring in the main commercial area, on an acreage which was reduced, largely because of official acreage allocation, to a level which gave the lowest harvested acreage since 1894. The late start, a cool summer, considerable but not extraordinary corn-borer damage and local frosts as early as August resulted in a yield of 37.6 bu. per acre (38.8 in 1949) and more use for ensilage than usual.

1945	2,880,933	1,535,676	1,108,224	9,015	95,289	68,150	1,993,837	418,020
1946	3,249,950	1,497,904	1,153,046	8,640	89,195	72,216	2,319,409	484,174
1947	3,283,970	1,199,422	1,367,186	11,857	89,286	78,259	2,109,581	389,048
1948	3,681,793	1,493,304	1,313,534	14,877	86,793	85,056	1,980,325	454,654
1949	3,379,436	1,329,473	1,141,188	16,128	87,240	90,549	1,972,359	411,565
1950	3,131,009	1,465,134	1,026,755	9,884	94,310	84,380	2,035,915	439,500

The 1950 wheat crop overcame many obstacles to stay in the billion-bushel class. In accordance with official acreage allocations, planted acreage was reduced by about 16% compared with 1949; seeding conditions were generally favourable in the southern plains, but later drought and green-bug damage led to the abandonment of more than 9,000,000 ac.—in Texas 53% of the seeded acreage was not harvested. The cold wet spring of the northern plains was followed by nearly ideal conditions except for some early frost. As a result, storage was abundantly available for the crop. It was indicated that total domestic consumption, of the crop and large carry-over, would not be much more than 725,000,000 bu. Exports, which in 1948-49 reached the unprecedented level of 503,000,000 bu., were expected to be about 265,000,000 bu. Thus, the carry-over at the end of the crop year, July 1, 1951, was expected to be about 450,000,000 bu. The war situation was such that acreage allocations were set for the 1951 crop at about the same level as for 1950. The preliminary survey in December of the 1951 winter wheat crop suggested that sown acreage was about 6% more than had been requested.

TEXAS FARM LAND illustrating strip cropping and terracing as methods of keeping top soil from blowing or washing away

and that the crop was in good condition except for need of surface moisture and snow cover, especially in the southern plains, and might produce 150,000,000 bu. more than in 1950. At the year's end all restrictions on the 1951 crop were removed.

The cotton crop of 9,884,000 bales was one of the smallest since 1900, grown on the smallest harvested acreage since 1884. Allocation of about 21,000,000 ac., as compared with 27,230,000 ac. harvested in 1949, together with unfavourable weather and heavy boll-weevil damage, combined to relieve the Commodity Credit corporation of its large surplus stocks, push prices to new all-time high levels and institute export controls, and caused the government to remove all restrictions on cotton acreage in 1951 and to hope for a 16,000,000-bale crop.

A crop of 439,500,000 bu. of white or Irish potatoes was produced, compared with the record 454,654,000 bu. in 1948, even though the harvested acreage was the smallest since 1874 and

the support price was set at 60% of parity instead of 90% as in 1949. Nevertheless, the crop was about 100,000,000 bu. more than national requirements. The average yield of 237.9 bu. per acre was a new record, and Maine again had a new record yield of 475 bu. per acre. It was probable that there would be no support program for the 1951 crop.

Such bountiful U.S. harvests, even with large year-end carry-over stocks, instead of being regarded as undesirable and calling for more severe restriction of production in 1951, were increasingly regarded in a new light, as an essential strategic stock pile. Most remaining stocks in government hands were restricted at the year's end and all-out production in 1951, particularly of cotton and feed grains, was the order of the day.

**Livestock Production.**—The somewhat regular variation over the decades in livestock numbers, sometimes referred to as the livestock cycle, having changed from a declining trend to an increase in numbers in 1949 for most kinds (excepting sheep and particularly horses and mules), continued in 1950 in an expanding phase. The reasons apparently differed somewhat for each type of animal, but the abundance of feedstuffs and the existing and potentially strong demand for meat and livestock products were recognized as major factors. The expansion of five points in production of livestock and its products during 1950 was not sufficient to counterbalance the moderate decline in over-all crop production, giving a total agricultural production volume for 1950 3% below the record 1949 production.

All cattle at the beginning of the year totalled 80,277,000 head, compared with 78,298,000 head a year earlier and 85,600,000 head at the peak in 1945, but approximately 12,000,000 head more than before World War II. Of that total, 24,625,000 head were milk cows, against 24,416,000 a year before. Slaughter of a slightly larger number of beef animals at heavier weights than in 1949 provided an estimated 10,873,000,000 lb. of beef and veal, compared with 10,770,000,000 lb. in 1949 and about 8,000,000,000 lb. prewar. It was anticipated that the number of beeves

slaughtered in 1951 would be somewhat larger even though fewer feeder cattle were placed in corn beef feed lots in the fall of 1950 than in 1949.

There were 60,424,000 head of hogs on U.S. farms at the beginning of the year, an increase from 57,128,000 head in 1949 but much less than the 83,700,000 head at the peak in 1944. The major spring pig crop was 59,997,000 head, much more than the 55,191,000 head of a year earlier, and the fall pig crop was indicated at 40,657,000 head, compared with 37,175,000 head a year before. Slaughter during the year produced an outturn of 10,939,000,000 lb. of pork, against 10,333,000,000 lb. in the previous year. At the year's end it was estimated that pork production in 1951 might approximate 11,700,000,000 lb., a result of the increased fall pig crop of 1950 plus an indicated expansion to 63,500,000 head in the spring crop of 1951. This was a prospective increase of 6% in the spring pig crop as compared with that of 1950 and was the basis of some emerging concern about the adequacy of feed supplies. The corn-hog ratio late in 1950 had declined to a level only a little above the average of about 12 to 1, as compared with a more favourable rate of about 15 to 1 a year earlier.

Livestock prices in 1950 followed divergent trends. Hog prices averaged at least \$2 or \$3 per hundredweight higher than in 1949 and ended the year at more than \$20 per hundredweight. Beef cattle of the fat sort were generally lower in price than in 1949, whereas feeder animals were considerably higher, thus narrowing the spread and increasing the risk of those farmers engaged in finishing high-grade beef. Late in the year the best grade of fat beeves was nearing \$40 per hundredweight. Grain-fed lambs, late in the year, set a new all-time high record price of just under \$33 per hundredweight. Hog prices were not supported by the government after March, and 1950 chickens and turkeys were not supported.

Sheep on U.S. farms at the beginning of 1950, 30,797,000 head, were the smallest number from the time records had been kept, having declined from 31,654,000 head the previous year and more than 50,000,000 head pre-World War II. Consequently, the lamb crop of 1950 was a record small one of 18,431,000 head; the indicated slaughter during 1950 provided only 608,000,000 lb. of lamb and mutton, about the same as in 1949. It was anticipated that the decline in sheep numbers would probably halt in 1950.

The 24,625,000 milk cows on U.S. farms at the beginning of 1950 represented an increase from 24,416,000 head in 1949 and a further increase took place during 1950, though leaving the total far short of the previous peak of 27,770,000 head in Jan. 1945. As a result of very heavy feeding and the uncommonly fine pastures of 1950, milk production per cow reached new record high levels, and total production for the year was about 120,500,000,000 lb., more than the 119,136,000,000 lb. of 1949. Prices of most dairy products increased after June and by the year's end government-held supplies of butter and cheese, accumulated under the price support program, were sufficiently cleared to be removed from the surplus list.

Poultry provided a large outturn during 1950, the volume amounting to 180% of 1935-39, whereas 1949 was 169%. Hens on farms at the beginning of the year were 481,190,000, compared with 448,676,000 head a year before. Chickens raised on farms in 1950 were only 670,000,000 head, as compared with 744,000,000 head the year previous. Commercial broilers at 540,000,000 head were 10% more numerous than in 1949. Turkey production was at a record high level.

No recent year, not even 1950, showed an interruption in the fast pace of the U.S. horse toward rarity, if not oblivion. There were 5,310,000 head on farms, compared with 5,898,000 head in 1949. Mules were 2,153,000 head, compared with 2,348,000 head in 1949.

World livestock numbers were restored rapidly. Cattle were

DUST STORM near Topeka, Kan., in March 1950, which brought damage to local crops and swept away much of the rich topsoil

estimated at a record 771,300,000 head, 28,000,000 more than pre-World War II; hogs at 279,000,000 head were up 7% compared with a year earlier; and sheep at 730,000,000 head had increased for the second consecutive year.

The wool situation received particular attention during 1950, especially pricewise. World wool production was estimated at approximately 4,000,000,000 lb., an increase of 140,000,000 lb. over the 1949 crop and 2% above the prewar average. Of the total, 1,350,000,000 lb. were Merino and 1,790,000,000 lb. cross-bred; Australia and New Zealand set a new record of 1,557,000,000 lb. But demand, especially after June, was so insatiable that carry-over stocks previously considered burdensome were essentially used up and price trends were sharply upward to new record levels; there were reports of forward contracts to purchase some of the 1951 U.S. wool clip at more than \$1 per pound in the grease. Negotiations for a strategic stock pile of at least 100,000,000 lb. were going forward with Australia.

**Food Stocks and Exports.**—Food stocks continued to increase in 1950 in the major exporting countries, more because of further recovery in importing countries than because of increased production in the surplus areas. For example, on July 1 carry-over stocks of wheat in the four major exporting countries stood at 783,000,000 bu., as compared with 663,000,000 bu. a year earlier. But world exports of wheat in the year ending July 1, 1950, were only 820,000,000 bu., compared with nearly 1,000,000,000 bu. in the preceding year. Feed grains, however, were in slightly smaller supply, in spite of the record carry-over of corn in the U.S., largely because of small Argentine crops in early 1950.

Food exports by the U.S. in 1949-50, mostly to Economic Cooperation administration countries or occupied areas, amounted to only 34,863,000,000 lb., as compared with 49,072,000,000 lb. in 1948-49. This export accounted for 11.7% of the total U.S. food supply in 1949-50. Wheat in some form made up more than one-half the total. Other grains accounted for about one-fourth. In any case, the demand from abroad was less imperative than in the previous year, and after June the emphasis shifted from that of somehow disposing of surpluses to that of urging the desirability of maintaining larger stocks for emergency needs.

**Farm Prices.**—Farm prices in 1950 experienced a moderate upturn until June, when inflation speeded the rise, and many products reached their highest levels of the year in its closing days. The index of prices received moved up 10 points (from 276 to 286) between Nov. 15 and mid-December. Some farm products made new record highs; but, in general, carry-over supplies were so substantial and current production so abundant that most products continued to be priced at levels well below their post-World War II peaks. In December the index of prices received for all farm products stood at 286 (1909-14=100), as compared with 233 a year earlier and a record high of 306 in Jan. 1948. Crop prices in general were 258% of the base, compared with 210% a year earlier, whereas livestock and its products

were at 311% of the base, as compared with 255% in Dec. 1949.

**Farm Income.**—Late in the year it was estimated that the total gross farm income for 1950 would be about \$31,800,000,000, as compared with \$32,000,000,000 in 1949 and a record of \$35,300,000,000 in 1948. This gross income included not only cash income from marketings, but government payments, value of home consumption, rental value of dwellings and expenses of agricultural production. Total farm production expenses amounted to about \$18,500,000,000, nearly 3% more than the \$18,000,000,000 of the previous year. The parity index of prices paid, interest, taxes and wage rates rose to a record high of 265 in Dec. 1950, compared with 246 a year earlier. Much of the increase in costs was the result of increased cost of purchased feeds; expenditures for stock and labour were also higher as were operating costs for motor vehicles and taxes. Realized net income was estimated at \$13,300,000,000, compared with about \$14,000,000,000 in 1949. Nevertheless, in the prewar year of 1938, realized net income was only \$4,327,000,000. Farmers' cash receipts from marketings in 1950 were estimated at about \$27,600,000,000, only slightly less than receipts in 1949. A larger volume of sales of livestock and livestock products at prices which averaged near the 1949 level gave about \$15,800,000,000, or 3% higher than in 1949. The estimated total of \$11,800,000,000 for crops was 8% lower than in 1949, a result of a 15% decline in volume at prices averaging 5% higher than in the previous year.

**Farm Land Values.**—Farm real estate in the U.S. in 1950 participated strongly in the inflation spiral, particularly after June. The national index of land values stood at 179 (1912-14=100) in November, 7% higher than a year before and 1% above the previous high reached in Nov. 1948. The increase was led by states in the north central and west south central areas, with values there averaging as much as 10% higher. Although the national index was 5% higher than the March 1920 peak, values in only 33 states had exceeded the 1920 level. The rate of farm real-estate sales reached the lowest level for some years in the first half of the year, then increased. There was a sharp increase in farm mortgage recordings.

**Farm Population.**—Although the farm population data from the 1950 census were not yet available at the end of the year, it was estimated that they would include approximately 18.7% of the total U.S. population of more than 150,000,000. In 1940 there were 30,269,000 included in the farm population, or 23% of the U.S. total, and in 1920 there were 31,614,000 on U.S. farms, or 29.9% of the total population.

**Farm Labour.**—Farm employment averaged 10,676,000 workers during Jan. through Nov. 1950, about 3% to 4% fewer as compared with 11,084,000 in the previous year. Family workers were 8,238,000, compared with 8,519,000 in 1949, and hired workers dropped to 2,438,000, compared with 2,565,000 (1949).

Farm wage rates in Oct. 1950 stood at 428% (1909-14=100), compared with 417% a year earlier. The average hired worker received \$102 per month plus board and room, or, if hired by the day, \$4.50. A tight farm labour situation and higher wages were anticipated in 1951.

**Farm Machinery.**—The farm machinery supply situation eased significantly during early 1950 in relation to demand, then tightened somewhat later in the year, partly as a result of the war scare on farmer demand and somewhat tighter supply resulting from material shortages and labour difficulties. Prices were at record levels. Mechanization of U.S. agriculture continued. The number of tractors on farms at the beginning of the year was 3,550,000 (exclusive of 275,000 garden tractors), 307% of the pre-World War II level and 50,000 more than a year earlier. Automobiles and motor trucks on farms were at peak levels in 1950. Exports of farm machinery were high.

**Commodity Credit Corporation.**—This financing organiza-

Table IV.—Farmers' Average Prices, Certain U.S. Crops, on Selected Dates  
(In cents per unit)

	Wheat per bu.	Corn per bu.	Oats per bu.	Barley per bu.	Rye per bu.	Buck- wheat per bu.	Pota- toes per bu.	Eggs per doz.	Cot- ton per lb.

tion of the department of agriculture carried on three major programs during the year 1949-50: (1) The price support program; (2) the supply program; (3) the foreign purchase program.

Under the farm price support operations, there was less call upon the government price support program than in 1949, largely because prices were near or above the loan level for most supported commodities. For some commodities, notably cotton, butter and cheese, it was possible for the CCC to move most of its large inventory into commercial or relief channels. Nevertheless, the CCC at the end of October had \$2,898,405,000 of its authorized \$6,750,000,000 borrowing authority tied up in commodity inventories or contracts to purchase or lend. This was about \$250,000,000 less than a year before.

The inventory in October included as major items not yet largely disposed of by the year's end: dried milk, 383,510,481 lb. costing \$49,409,956; linseed oil, 496,147,080 lb. costing \$141,850,271; barley 31,398,552 bu. costing \$45,747,078; dry beans, 9,028,571 cwt. costing \$73,743,838; corn, 357,505,925 bu. costing \$552,513,586; grain sorghums, 30,587,796 cwt. costing \$80,952,459; wheat, 297,085,735 bu. costing \$707,186,713; and dried eggs, 108,648,358 lb. costing \$114,986,624. A large potato program was yet to be met. It was indicated that funds tied up in inventory were not realized losses but would be recovered in part or in total when inventory was liquidated. The realized net loss for the year 1949-50 was \$246,583,888, of which potatoes accounted for about \$75,000,000.

**Marketing Research.**—Activities under the Research and Marketing act of 1946 included nearly 50 new projects, bearing on the efficient processing and distribution of agricultural commodities and new and expanded uses for agricultural products. Meanwhile, the farmer's share of the market-basket dollar stood at approximately 49%, as compared with 48% in 1949, 53% in 1948 and 40% in 1940.

**Commodity Trading.**—Activity in commodity future markets during 1950 was generally of substantial volume and on the whole orderly, excepting for a sharp speculative run-up in soybean prices resulting in an investigation which revealed some unusual Chinese activity in the market. The Commodity Exchange authority continued to request legislation to extend its supervision to future trading in 11 additional commodities, for authority to fix minimum margin requirements on speculative transactions and to require the registration of commodity trading advisory services.

**Agricultural Legislation.**—The year 1950 was moderately quiet in respect to legislation for agriculture. The Brannan proposal (by Charles Brannan, secretary of agriculture) of April 1949 continued to be very widely debated, particularly before events in Korea diverted attention.

A report on coffee, prepared by the staff of a subcommittee of the senate committee on agriculture and forestry investigating

the spread in prices between the producer and the consumer, received widespread attention, particularly in coffee-producing Latin-American countries, but resulted in no legislation.

The Defense Production act provided that minimum ceilings on farm and food products should not be set lower than either the full parity price of the product or the highest price to producers reached during the period May 24 to June 24, 1950, whichever was the higher. Thus, at the year's end, as over-all ceilings seemed to be approaching, there was considerable discussion as to how price stability could be achieved under the above provisions, except at a higher level, inasmuch as only a few products had reached the minimum levels specified.

Federal taxes on oleomargarine were repealed and it was required that coloured oleomargarine, if sold in packages of one pound or less or as individual servings in restaurants, be specifically labelled.

Price supports were prohibited on 1950 crop Irish potatoes if marketing orders made under the Agricultural Marketing Agreement act were disapproved. Price supports on Irish potatoes in 1951 and thereafter were prohibited unless marketing quotas were in effect.

The Commodity Credit Corporation Charter act was amended to increase by \$2,000,000,000 the borrowing authority of the corporation.

(J. K. R.)

**Other Countries.**—In western Europe during 1950, agricultural policies continued to be determined largely by difficulties in balancing international payments, and all countries planned that their farms as well as their mines and factories should continue to increase production.

The year was memorable for the changes it witnessed in attitudes toward the agricultural development of Africa and Asia. The enthusiastic launching of the United Nations Food and Agriculture organization, the East African peanut scheme and plans for India and southeast Asia had given way during 1948 and 1949 to many doubts and substantial criticisms. In Asia, these were largely removed during 1950 in consequence of the expansion of the Communist-controlled area and the growing menace to Indochina, Thailand and Burma, the major rice-exporting countries of the world.

A British Commonwealth conference at Colombo, Ceylon, resulted in a realistic study of six-year development programs for the countries of southern Asia, but not including Burma or Indonesia. The conference arranged priorities within a program which, up to 1957, would cost about £1,900,000,000. Of that sum the major portion would directly benefit agriculture. Part of it was to be contributed within the Asian countries themselves as loans and tax revenues, and part was to be loans from the International Bank for Reconstruction and Development, the Export-Import Bank of Washington, D.C., and the United States technical assistance program, originally known as Pres. Harry S. Truman's Point Four program. In addition, loans, interest-free

CATTLE THRESHING RICE by ancient method in Indochina in 1950

credits and gifts from western governments, particularly from the U.S., were to be sought. The underlying aim was to prevent the continuing upsurge of human populations from further undermining living standards and curtailing economic progress.

In some parts of British tropical African territories the need for the rapid expansion of agricultural production was re-emphasized. Growing human populations, changing political ideas and demands for higher standards of living despite financial difficulties were the basic reasons. The costs and failures of the East African peanut scheme also drew public attention to African problems. The post-World War II shortage of vegetable oils and the balance-of-payment problems of the sterling area were the initial reasons for this scheme, and at first it gained wide support. But the large capital investment required and the high overhead costs of production in sparsely populated areas of Tanganyika with unreliable rainfall and many unsolved scientific problems soon became apparent. By Sept. 1950 a drastic curtailment and alteration of production plans had to be decided on. In place of the 450,000 ac. of crops first projected at Kongwa, only 12,000 ac. were to be cropped in 1951, 1952 and 1953. The remaining 80,000 ac. of the cleared area were to be used for cattle ranching.

In eastern Europe the principal development in agricultural policy was an acceleration of the collectivization of holdings in Poland and Czechoslovakia. Ambitious five-year plans were announced to increase livestock production by 66% in Poland and 86% in Czechoslovakia, the increase in Poland to make possible considerable exports. In the U.S.S.R. increases in the size of collective farms and further attempts to increase labour and machine efficiencies were planned. But in Yugoslavia the resistance

of peasant farmers brought a promise from Marshal Tito that they would no longer be placed under duress to join collective farms and that their needs would be as well attended to as were those of the existing collectives.

The most noteworthy development in Australia, New Zealand and the Union of South Africa was toward substantial further expansion of meat production. In Australia meat production would have to increase 34% by 1970 to keep pace with the expected increase in population and to maintain exports. Transport facilities costing £5,500,000 were projected to help the flow of cattle from northern Australia and further trials were made of the air transport of fresh carcasses from outlying areas.

Despite some reduction of wheat and rye acreages in favour of crops for feeding to livestock, and despite severe drought in some areas, European production of wheat and rye was about 4,400,000 metric tons greater in 1949 than in 1948. The reduction in the world total exports of wheat and flour was equal to 4,100,000 metric tons but, taking into account the increase in domestic harvests, the net reduction in the total supplies of Europe was only about 1,300,000 metric tons (2%). This caused no difficulty, in part because stocks were adequate, and in part because with increasing supplies of milk, meat and eggs the consumption of bread grains was tending to decline.

Thus flour consumption in the United Kingdom, which averaged 100,800 metric tons a week during 1948, fell to 92,000 metric tons a week by spring 1950. The minister of food was able on Aug. 27, 1950, to lower the rate of flour extraction from wheat from 85% to 80%.

Progress was made in Ireland with a land reclamation project, the biggest of its kind in Europe. **Agriculture, U.S. Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**Aircraft Manufacture.** In the report published by the President's Air Policy commission early in 1948 a strong aircraft industry in the U.S. was recognized as an essential element in the nation's air power. "Our air establishment would be useless," said the commission, "unless backed by a manufacturing industry skillful in technological application, efficient in production, capable of rapid expansion and strong in basic financial structure." It was then estimated that the maintenance of an air force of 70 combat groups would not only meet the normal strategic and tactical requirements of the national defense but would also create sufficient demand to automatically keep the aircraft industry in a strong and healthy condition.

Unfortunately, the congress failed to implement the recommendation of the commission and of its own Aviation Policy board. During the following two and one-half years under the program of economy promulgated by the secretary of defense, the air force was permitted to shrink rather than to expand. As a result, when the crisis of the Korean war came in the summer of 1950, the aircraft industry's position was one of low productive efficiency, with little capability for immediate rapid expansion. Drains on its capital reserves had weakened its basic financial structure. Only in skill in technological application could it meet the requirements which were considered minimal by the president's advisers.

Fortunately a certain amount of research and development money had been made available from government sources during

FOOD PRODUCTION in the United States, as measured by index numbers (1935-39=100). Estimates by the department of agriculture; 1950 is preliminary

AEROPHYSICS TEST LABORATORY opened at Daingerfield, Tex., in May 1950. It was operated for the navy bureau of ordnance by Consolidated Vultee Aircraft Corp. to test large-scale ramjet engines at simulated altitudes of approximately 20 mi. above the earth and at four times the speed of sound

the first few years following World War II. This permitted aircraft designers to produce a number of experimental prototypes of performance vastly superior to the machines in use at the end of World War II. During that period a fundamental revolution in aircraft design had taken place, touched off by the introduction of jet and rocket type engines which far and away exceeded the power-producing capabilities of the older engine and propeller combinations.

Backed by research and development funds, many new military aircraft went through "paper" and test stages, but few rolled out of factory doors. Construction was held to a strictly jobbing basis. Expansion to mass-production levels required for a modern war was still a matter of two to three years, even though prototypes were standing by, tested and ready to go.

The production build-up period (as contrasted with that of 1942-43) was lengthened because comparable aircraft had not only doubled in performance but had more than doubled in size (in terms of weight). For example, a fighter plane of the early 1940s was fitted with a 1,200 h.p. engine, had a speed of 300 m.p.h., a range of 1,000 mi. and a service ceiling of about 20,000 ft. Its gross weight was 8,000 to 10,000 lb. Its counterpart of 1950 was powered by an equivalent of 12,000 h.p. (in jet-type engines), had a service ceiling of 50,000 ft., a range of about 2,000 mi. and a top speed in the neighbourhood of 700 m.p.h. Its gross weight was in the neighbourhood of 20,000 lb. All classes of military aircraft underwent changes of the same order of magnitude in the same period.

As a corollary of increased performance, all types of aircraft had become tremendously more complicated.

A modern military aircraft is little more than a metal shell surrounding an astonishing maze of electronic devices for automatic control, for aiming and firing its guns, for navigation and communication, and for generally keeping its crew out of trouble. Although total air frame weight had about doubled that of its predecessors, the man-hours of labour required to manufacture it had been multiplied by at least four.

In addition, labour and material costs had gone up tremen-

dously. The aggregate effect of cost increases all along the line (for research, design, materials and final manufacture) was to multiply the unit cost of all types of aircraft by a factor of five or six. A single-seat fighter plane in 1942 cost the government \$50,000 to \$60,000. Machines for similar missions in 1950 cost as much as \$250,000 each. During World War II, B-17 bombers cost about \$275,000 complete. Light medium bombers of 1950 cost approximately \$1,000,000 each, and a B-36 heavy bomber cost more than \$3,000,000. Obviously, far fewer aircraft could be purchased in 1950 for a given amount appropriated than could be purchased ten years before.

Because of complication and high costs, it was far more difficult to effect rapid expansion of production in the aircraft industry in 1950 than during World War II. As a result there was relatively little gain in production during the last six months of 1950. The exact figures were not released, but it was estimated that approximately 3,000 aircraft were delivered to the armed services during the entire year, compared with 96,000 aircraft produced in 1944. During the latter year, about 1,750,000 people were employed in the aircraft industry. The average for 1950 was 228,000.

It was thought that the industry might have grave difficulty in meeting the fivefold increase in aircraft production asked for 1951 by the president in his speech announcing the national emergency in December. Such a rate of increase was never achieved under the most pressing conditions of World War II.

The problem was not in terms of money immediately available. There were more dollars earmarked than could be spent effectively in the year. During the fall of 1950, the 81st congress appropriated more than \$10,000,000,000 for new aircraft procurement for fiscal year 1951. If a percentage of such funds had been put into the aircraft industry two or three years before (as was recommended by the President's Air Policy commission) the industry would have been in a far better position to meet immediate requirements. The budgetary stringencies of 1946-49 created a condition that precluded any real capability for rapid expansion in an emergency.

The aircraft industry thus had little "fat" on which to live during a period of slack military buying. It suffered crippling losses in developing and marketing new transport aircraft for a

relatively thin market. Post-World War II commercial purchases (by air lines and by private owners) were not sufficient to maintain the degree of financial stability required for national security. Thus, on the financial side also the U.S. aircraft industry of 1950 was far below the minimum strength for safety as defined by the commission in 1947.

Some improvement in fiscal position took place in 1950. It was estimated that the total dollar volume for aircraft, engines and propellers would reach more than \$2,000,000,000 as compared with \$1,500,000,000 in 1949. Profitwise, the picture was not clear because of uncertainties created by effects of contract renegotiations and retroactive excess profits taxes, but it seemed probable that the major U.S. companies operated at a profit in 1950.

During 1950, as military buying started its upward trend, production of aircraft for nonmilitary usage continued to decline. As the country's air lines completed their postwar fleet modernization programs, sales of transport and executive types of aircraft declined from 263 in 1948 and 166 in 1949 to 97 in 1950. For most companies, such a volume of sales was insufficient to cover development costs, or to offset rising production costs.

The next move among air line operators at the end of 1950 was to replace existing piston-engined aircraft of the 300 m.p.h. class with larger and faster (400 m.p.h.) jet transports. This was a long-range project that could not, under ordinary conditions, be completed in less than three to five years. The greatest obstacle was the extremely high cost of development of such aircraft. No private operator (or group of operators) or no single manufacturer could afford to underwrite the program.

A law providing for a transport aeroplane prototype testing program, involving an expenditure of \$12,500,000 over a period of five years, was signed by President Truman in September. No actual funds had been appropriated for this program at the end of 1950, but a prototype aircraft advisory committee headed by the Civil Aeronautics administrator was being formed, to have wide representation from civil, research and military government agencies as well as from the industry. The lack of jet transports in the U.S. and the continued progress of such aircraft as the British de Havilland Comet, and the Canadian Avro C.102, in which some U.S. air lines had shown interest, were matters for concern in both civil and military circles.

For personal and industrial use the industry produced an estimated 3,450 light planes in 1950. Total sales were about \$18,500,000. These figures represented increases of less than 100 planes and more than \$4,000,000 over 1949. The continuing demand for executive planes of four or more places accounted for the large increase in sales value over 1949, when a higher proportion of two-place planes was produced.

The outlook for 1951 was not certain in view of military production expansion. Priorities for the continued production of civil aircraft were expected to receive action at the end of the year, on a level of production to be recommended by the Civil Aeronautics administration.

The manufacture of helicopters became of increasing importance, as these direct-lift machines proved their capabilities in the Korean war and also showed great promise for antisubmarine defense. Estimates indicated a production of more than 100 commercial and military helicopters in 1950 with a substantial increase scheduled for 1951.

The Mutual Defense Assistance program, which was authorized late in 1949, began to have some helpful effect on the aircraft industry in 1950. Shipments of aircraft and other aeronautical equipment abroad amounted to \$81,000,000, and electronic and communications equipment to \$23,000,000. Altogether, 228 aircraft went overseas, of which 170 went to North Atlantic treaty nations and the rest to Pacific and far east nations. Most

of the aircraft, however, came out of mothballed U.S. surplus.

Appropriations requested to implement the program during 1951 totalled \$5,200,000,000, of which \$1,262,000,000 was earmarked for aviation. Of this, \$1,148,000,000 was for aircraft, spares and other aeronautical equipment and supplies, and the greater part of the remainder for electronic and communications equipment.

FILMS OF 1950.—*Airplanes and How They Fly* (Young America Films, Inc.). (S. P. J.; M. H. SM.)

**Air Forces of the World:** see AVIATION, MILITARY.

**Air Mail:** see POST OFFICE.

**Airports and Flying Fields.** The 1947 National Airport plan and the 1948 and 1949 revisions were based on a three-year forecast of the needs of civil aviation in the United States. The 1950 National Airport plan, accordingly, was assembled as revision and refinement of the preceding plans and showed a projected three-year forecast of aviation needs. The 1950 plan reflected an up-to-date appraisal of the way airports were serving the nation and what was required to round out safely and effectively the National Airport system.

The fiscal summary of the 1947-50 federal airport program indicated that the federal government had expended or committed the sum of \$130,731,802 for airport development, and that the sponsors' contributions (state or territory) amounted to \$140,741,656 for a total program of \$271,473,458.

*Civil Airports by Class as of Jan. 1950*

Class 1 and Sub 1	4,100
Class 2	1,027
Class 3	576
Class 4	447
Class 5	185
Class 6 and over	149
Total	6,484

*Civil Airports by Type as of Jan. 1950*

Commercial	2,585
Municipal	2,200
CAA Intermediate Landing Fields	139
Military	350
All other types	1,210
Total	6,484

**Explanation of Terms.**—*Airport.*—Any area of land or water which is used, or intended to be used, for the landing and take-off of aircraft, and any appurtenant areas which are used, or intended to be used, for airport buildings or other airport facilities or rights of way, together with all airport buildings and facilities located thereon.

*Classes of Airports.*—For statistical purposes airports are divided into numerical classes based on the longest usable landing strip.

Class	Length*
Sub 1	Less than 1,800 ft.
1	1,800-2,700†
2	2,700-3,700†
3	3,700-4,700†
4	4,500-5,500‡
5	5,500-6,500
6	6,500-7,500
7	7,500-8,500
8	8,500-9,500
9	9,500 and more

\*Sea level lengths—increased for elevations above sea level.

†Lengths are decreased 200 ft. if paved.

‡Class 4 and up must have at least one paved runway of the length required for its class

*Present Class.*—The present status of an airport, indicated in accordance with classifications given above for class of airport.

*Proposed Class.*—Class of airport as defined above, required to meet the anticipated aeronautical needs of the community or locality within the succeeding three years.

*Types of Airports for Scheduled Air Service.*—Airports for scheduled air service are assigned service types as defined in

the Civil Aeronautics administration's technical standard order N6a.

Service Type	Length*	Definition
Feeder . . . . .	Up to 3,500 ft.	For feeder-type service
Trunk . . . . .	3,500 to 4,200	To serve on air-line trunk routes
Express . . . . .	4,200 to 5,000	At large cities or important junction points on trunk routes
Continental . . . . .	5,000 to 5,900	Serving long nonstop continental flights
Intercontinental . . . . .	5,900 to 7,000	Serving long intercontinental or transoceanic flights
Intercontinental Express . . . . .	7,000 to 8,400	Serving transoceanic flights of largest types of aircraft

\*Lengths must be increased for elevation, temperature and gradient.

**Present Type.**—Service indicated as warranted now or within the immediate future.

**Ultimate Type.**—Service indicated as warranted within the foreseeable future.

**Air Cargo Terminal Freight Bridge.**—A three-year study of what is required to develop a high-efficiency air freight terminal had reached a stage late in 1950 where specifications for such a terminal and related components were nearly complete.

In devising a terminal for efficient freight flow, a basic functioning part of the plan for an air freight depot is a flexible, portable ramp device designed to eliminate, by bridging the aeroplane door to a terminal dock, the high hoist that makes aeroplane cargo loading a time-consuming and expensive operation.

Briefly, this self-powered appliance consists of a main span supported by two towers mounted on powered carts or dollies having pneumatic-tired wheels, a cantilever extensible and retractable section, a hinged inboard dock board, a removable weather canopy and a dock board to span the gap between the outboard end of the extensible section and the area immediately inside the aeroplane door.

The maximum extended length of the ramp bridge is 85 ft.; the length with the cantilever extension retracted is 70 ft. This allows a total of 15 ft. in extension, making it relatively simple to park an aeroplane so that the bridge is within reach. There is no need of precise spotting of aircraft. (E. M. E.)

**International.**—Sir Robert Watson-Watt, the British radar scientist, commented during 1950 on the backward state of air traffic control equipment as established at airports and on airways throughout the world: much of the existing radio and radar used in civil aviation was out-of-date as applied to conditions at that moment; and most of the control sets had been adapted from former military stock.

This opinion was shared by those in official administration of airports and was particularly significant in view of the approaching era of jet air liners with operational speeds of 500 m.p.h. Jet aircraft came into the civil aviation picture in 1950, but for operating economy had to fly at great heights. Any time spent in the air at low altitudes, as was the practice for piston-engined types in approach procedures to airports, would have introduced costly and sometimes impractical conditions for the new class of high-speed air liners. Consequently, much of the progress in airport design and construction in 1950 was rather toward improving air traffic control equipment, passenger- and freight-handling facilities and buildings than in establishing new airports. In a number of instances this policy of improvement extended to the lengthening and strengthening of runways and other hard pavings so as to bring existing airports up to current international standards. This trend was especially noticeable in Europe, where, for example, a rejuvenated Ciampino airport near Rome carried the greatly increased air traffic for the Holy Year celebrations.

**Great Britain.**—Probably of great importance to the air traffic control systems of the future was the installation of long-range radar search equipment at London airport. By this means

PROMENADE DECK (right) of the Friendship International airport, one of the largest in the world, which was dedicated at Baltimore, Md., on June 24, 1950. The 32,000-ac. field has an instrument landing runway which is 9,450 ft. long and is 200 ft. wide throughout

controllers were able to direct approaching and departing aircraft on scheduled flights within their area by reference to a radar picture showing the whole sky in azimuth up to a maximum of 150 mi.

A decision, moreover, was reached on Stage 3 development of London airport. The original duplicate "triangular" runway scheme north of the Bath road was abandoned in favour of a new plan on that site to construct two runways placed end to end and running east-west but slightly divergent from one another. The object of this offset arrangement was to provide lateral separation for aircraft making simultaneous landing and take-off.

**Africa.**—A new airport of considerable potentiality was opened to traffic on Aug. 12 at Livingstone, Northern Rhodesia. This airport, class 2 under the specifications of the International Civil Aviation organization, was thought to have possibilities as a crossroads of air routes in central and southern Africa; its proximity to the Victoria falls on the Zambezi river was judged to be a great tourist attraction.

Similarly the new main Egyptian air terminal established at Farouk airport near Cairo was said to have possibilities as the crossroads for North Africa and the middle east.

**Argentina.**—The new airport near Buenos Aires at Ezeiza became fully operational during 1950, with three runways capable of taking the largest and heaviest air liners and with adequate means for passenger- and freight-handling. (See also AVIATION, CIVIL; AVIATION, MILITARY; CIVIL AERONAUTICS ADMINISTRATION.) (C. F. As.)

**Air Races and Records.** With the cancellation in 1950 of the National Air races at Cleveland, O., and other major trophy events, chief interest fell to the minor meets, all of which made civil air defense their theme. Plans were well under way for the National manoeuvres, with "souped-up" military surplus planes barred following the accidents of 1949, when Louis Johnson, secretary of defense, announced that air force planes were barred from competing in

scattered events through the year. Then, on June 22, Frederick Crawford made known the postponement of the National Air races until Armed Forces day of 1951, to assure complete co-operation of the three branches of the service.

Thus no racing was held for the Thompson, Bendix or Goodyear trophies. The Goodyear Company previously had notified the national meet management that it would not sponsor an event for its famous award, having fulfilled a promised three-year sponsorship of the 190-cu.in. class.

S. J. Wittman, professional racing pilot of Oshkosh, Wis., won the Continental Motors trophy in the feature event for midget planes at the All-American manoeuvres in Miami, Fla. Averaging 185.4 m.p.h. in the final heat, he captured the prize for the second straight year and won \$1,800 to add to money he had won in the previous heats. Keith Sorenson of La Crescenta, Calif., was second at 182.044 m.p.h.

Thirteen feminine fliers competed in the Powder Puff Derby of 1,400 mi. from Montreal to West Palm Beach, a feature of the all-women's manoeuvres in Florida. Betty Haas of Scarsdale, N.Y., an air-line hostess and flight instructor, won the Cessna trophy for the all-daylight event with an elapsed time of 10 hr. 43 min. 42 sec. Peggy Lennox of Hollywood, Fla., was second. Janet Russell of St. Petersburg, Fla., captured the 65-h.p. closed-course race and Barbara Shoemaker of Hackensack, N.J., triumphed in the class from 75 to 125 h.p.

The fourth annual women's transcontinental race from San Diego, Calif., to Greenville, S.C., was annexed by Jean Parker and Boots Seymour of Arcadia, Calif. Their elapsed time of 20 hr. 1 min. for 2,460 mi. beat the handicap allowed their Taylorcraft plane by more than 5 hr. Elizabeth Lambert and Claire Hale of San Diego were second.

The big prize in the international jet meet held in England was won by Lieut. Comdr. M. Lithgow, piloting a Vickers Submarine Attacker. With 50,000 persons looking on, Lithgow flew over the 124-mi. course at an average speed of 570 m.p.h.

The Michigan Wing of the Civil Air patrol again sponsored the Michigan State Amateur Flying championships. Lieut. Vernon Sharpe, C.A.P. pilot from Berkeley, was high scorer with 30 points and captured the Governor's trophy. Sharpe won the spot landing events from a free glide and from a controlled approach. First in cross-wind landing and take-off was Howard Hale of Lansing, while Elving McCarthy of Pontiac led in target dropping and Lyle Bradford of Eaton Rapids was first in precision spins.

(T. V. H.)

**A.L.A.:** see AMERICAN LIBRARY ASSOCIATION.

**Alabama.** Located in the heart of the "deep south," Alabama became the 22nd state of the United States Dec. 14, 1819. It is popularly called the "Cotton state," or the "Yellow-hammer state." Area: 51,609 sq.mi. (51,078 sq.mi. of land and 531 sq.mi. of water). In 1950 the total population of the state was 3,061,743, or 8.1% more than the 1940 population of 2,832,961.

Montgomery, the capital city, in 1950 had a population of 105,098; Birmingham, the state's largest city, 298,720; Mobile, 127,151; Gadsden, 55,528; Tuscaloosa, 46,364 (preliminary census figures).

**History.**—The principal elective officials of the state in 1950 were: James E. Folsom, governor; J. C. Inzer, lieutenant governor; Albert A. Carmichael, attorney general; Dan Thomas, state auditor; Haygood Paterson, commissioner of agriculture and industries; Sibyl Pool, secretary of state; John Brandon, state treasurer; Austin R. Meadows, state superintendent of education. Governor Folsom called five special sessions of the state legislature in an effort to get a law passed to reapportion

GORDON PERSONS, Democrat, elected governor of Alabama, Nov. 7, 1950

the state legislature. During the fifth special session, the legislature set up a 12-man committee which devoted four weeks of intensive study to the question of reapportionment. However, the committee's proposals were voted down when the legislature adjourned sine die, Oct. 25, 1950. Governor Folsom favoured reapportioning the senate by giving each of the 67 counties one senator. The state supreme court ruled this unconstitutional since the Alabama constitution stipulates that reapportionment shall be based upon population and not geographical areas.

This being defeated, the governor then attempted to get a constitutional convention called for rewriting the entire constitution, but it was not favoured by a majority of the legislature. Thus, antiadministration forces succeeded in blocking every move made by Governor Folsom to reapportion the legislature.

The antiadministration bloc tried vainly in the special sessions to get a bill, known as the Boswell amendment substitute, passed; this would have put voting restrictions on the electorate, particularly the Negroes. The administration forces succeeded in killing each of those proposed bills. The original Boswell amendment was declared unconstitutional by the supreme court in 1948. The governor's salary was raised from \$6,000 to \$12,000, effective Jan. 15, 1951. The gubernatorial primary election was held May 2, 1950. Gordon Persons was elected Democratic party nominee, and was elected governor in the general election, Nov. 7, 1950.

**Education.**—During the academic year 1949-50 (ending June 30), the total number of public schools in the state was 3,356. Total enrolment for these schools was 684,908. Of this number 454,171 were enrolled in elementary schools and 230,737 in high schools. There were 13,093 elementary school teachers and 8,483 high school teachers. There were 11 state-supported institutions of higher learning with 26,271 students enrolled on campus and a teaching staff of 1,464, plus 136 part-time teachers. Of this enrolment, 3,616 were Negroes, with teachers numbering 158. The total on- and off-campus enrolment, including the attendance at the five university centres, was 36,807, with 1,995 teachers, plus 335 part-time teachers and 184 part-time doctors and dentists serving at the Medical College of Alabama at Birmingham. Of this enrolment 4,756 were Negroes, 158 teachers being employed. There were also 11 denominational and private colleges with an approximate enrolment of 11,500.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Amounts spent for public assistance categories in Alabama during the fiscal year 1949-50 (ending Sept. 30) and average number of recipients (in parentheses) during 1949-50 were as follows: old-age assistance \$19,399,350.57 (79,472); aid to the blind \$388,359.60 (1,429); aid to dependent children \$6,347,846.46 (16,627); aid to children in foster care \$164,019.45 (508); aid to handicapped \$1,234,966.36 (8,369); temporary aid \$25,863.18 (101). During the fiscal year 1949-50 approximately 97,000 beneficiaries were paid \$17,098,594 under the unemployment compensation program. Approximately 5,500 unemployed persons received \$1,199,479 under the readjustment allowance program; 425 self-employed received \$192,332 under the same program. Prison population as of Oct. 1, 1950, totalled 4,604—318 less than one year previous. Total expenditures for the department of corrections and institutions for the fiscal year 1949-50 was \$3,387,348.28.

**Communications.**—The state highway system consisted of 7,774 mi. of road, the county system had 52,360 mi. of road, and there were approximately 4,100 mi. of municipal streets. For the fiscal year 1949-50 state expenditures for highways by the state highway department were \$32,115,269.78. Estimated railroad mileage within the state was 5,206. There were

Table 1.—Leading Agricultural Products of Alabama

	1950	1949	Average 1939-48
Cotton, bales . . . . .	570,000	852,000	912,000
Corn, bu. . . . .	64,012,000	57,456,000	44,408,000
Peanuts, lb. . . . .	335,400,000	290,500,000	295,360,000
Hay, tons . . . . .	616,000	650,000	754,000
Sweet potatoes, bu. . . . .	4,929,000	4,565,000	5,519,000
Irish potatoes, bu. . . . .	3,955,000	3,432,000	4,318,000
Oats, bu. . . . .	4,108,000	4,230,000	4,840,000
Soybeans, bu. . . . .	1,620,000	1,037,000	371,000
Sorghum grain, bu. . . . .	946,000	946,000	569,000
Peaches, bu. . . . .	440,000	792,000	1,400,000
Sugar cane syrup, gal. . . . .	1,380,000	1,820,000	2,478,000

1,075 mi. of controlled civil airways, 60 mi. of noncontrolled and 2,420 mi. of off-airway direct air carrier routes. The number of active airports was 126, including 16 service type fields. The tonnage of water-borne commerce in the state was estimated at 4,750,000. The approximate number of telephones was 415,400.

Table II.—Principal Mineral Products of Alabama

Mineral	1949	1948	Value, 1949
Coal, tons	15,725,732	17,371,000	\$96,455,000
Iron ore, tons	8,433,807	7,914,000	25,265,000
Cement, bbl.	10,876,000	9,912,000	18,233,000
Stone, tons	3,164,000	2,944,000	6,922,000

**Banking and Finance.**—On June 30, 1950, there were in Alabama 155 state banks and 1 branch, which had total deposits of \$272,603,946.38 and total resources of \$298,204,084.82; 70 national banks and 23 branches which had total deposits of \$892,394,000 and total resources of \$964,725,000; 28 savings and loan associations with total resources of \$57,948,349; 84 credit unions with resources of \$9,085,173. According to budgetary figures the state government receipts for the fiscal year 1949–50 were \$94,091,926. Expenditures totalled \$90,235,675 and \$3,856,251 was transferred to surpluses; the gross state bonded indebtedness Sept. 30, 1950, was \$45,464,000 and sinking funds totalled \$16,234,000 with a net state indebtedness of \$29,230,000. Net receipts for the fiscal year 1949–50 were \$193,106,153; net disbursements, \$190,952,491.

**Agriculture.**—The total value of agricultural production in Alabama during 1949 was estimated at \$511,932,000. This includes the value of crops produced in 1949, regardless of when they were used or sold, plus the value of livestock and livestock products marketed during the calendar year. During 1949 crops were harvested from 5,884,000 ac. excluding duplications. Cash income from sale of crops was \$219,693,000; sale of livestock and livestock products amounted to \$119,063,000; income from government payments was \$5,482,000.

**Manufacturing.**—The 1949 total estimated value of manufactures in Alabama was \$2,966,500,000. Persons employed totalled 252,540 and the yearly pay roll was \$596,000,000. The primary metals industry employed 55,750 and the value of the product was \$790,500,000; textiles employed 59,600 and the product value was \$533,000,000; the lumber industry employed 47,550 and the product was valued at \$355,000,000; food product industries employed 16,500 and the total value of products was \$315,400,000.

**Minerals.**—The total value of Alabama mineral production in 1949 was \$172,655,000; in 1947 the value was \$117,764,000. No major fields were opened during 1949.

(R. C. HA.)

**Åland Islands:** see FINLAND.

**Alaska.** Alaska, the northernmost territory of the United States is separated from Siberian U.S.S.R. by the Bering strait. The boundary line runs between the Big Diomed Island, which is soviet soil, and the Little Diomed Island, which is on the U.S. side. These islands are about 4 mi. apart. Alaska has an area of 586,400 sq.mi. Its population according to the 1950 census was 128,643, compared with 72,524 in 1940. The gain of 77.4% in the ten-year period did not include the military, naval or coast guard personnel stationed in the territory. The Aleutian Islands, a chain of small islands extending about 1,200 mi. westward from the extremity of the Alaskan peninsula, constitute part of the territory of Alaska. The largest town is Anchorage, with a 1950 population of 11,060, compared with 3,495 in 1940. Other towns and their preliminary 1950 populations are as follows: Juneau (5,818); Ketchikan (5,202); Petersburg (2,291); Sitka (2,080); Wrangell (1,227); Kodiak (1,625); Seward (2,063); Nome (1,852); Fairbanks (5,625); Seldovia-Homer district (1,526). Chief officers of the territory: Ernest Gruening, governor since 1939; Llewellyn M. Williams, secretary of Alaska; E. L. Bartlett, delegate in congress; Henry Roden, territorial treasurer; Frank A. Metcalf, highway engineer; J. Gerald Williams, attorney general; James C. Ryan, commissioner of education; Neil F. Moore, auditor.

**History.**—An epidemic of infantile paralysis broke out in Alaska during 1950 and at the end of the year 70 cases were reported in the territory, the majority of them in the interior area around Fairbanks. Advances were made during the year in improving the hospital system. A new 400-bed sanitarium was completed at Anchorage; a 40-bed wing was added to St. Joseph's hospital; a new 34-bed hospital was finished at Nome and 125 beds were added at Mt. Edgecumbe sanitarium near Sitka. The latter institution previously had 200 beds.

Millions of dollars went into building up the defenses in Alaska during the year. The army and navy were spending more

SKI TROOPERS resting for a moment during joint U.S.-Canadian war manoeuvres held under arctic conditions in Alaska and the Yukon during 1950. Some 5,200 troops were involved in the war games identified as Exercise "Sweetbriar"

than \$120,000,000 for construction, and more than \$4,000,000 more was earmarked for improving the Alaska communication system, a branch of the army. Another \$1,500,000 was being spent to repair the Alaska railroad, a government-owned line which operates through interior Alaska from Seward to Fairbanks and to Whittier, a port, like Seward, on the southwest coast.

**Education.**—Alaska in 1950 had 32 high schools with 2,169 pupils and 182 teachers. The elementary schools, 94 in number, had an enrolment of 10,727 and 471 teachers. For native children the Alaska native service, a division of the department of the interior, maintained 85 day schools and three boarding schools with an enrolment of 5,000.

**Banking and Finance.**—The territory had a net cash balance of \$2,728,117.83 at the end of 1950. Alaska has no bonded indebtedness and operates on a cash basis. Funds of the territory were deposited in the 17 territorial banks and 4 national banks located within Alaska.

**Fisheries.**—Alaska's salmon pack, considered the largest in the world, totalled 3,177,003 cases in 1950 with a value of \$85,000,000. The halibut, shrimp, crab and cod fishery brought the total value of the sea-food pack of the territory up to more than \$100,000,000 for the year.

**Mining.**—Total value of mineral production for the year was slightly more than \$15,000,000. Of this production, gold accounted for \$8,000,000 while the balance represented coal, silver, copper, lead, zinc and platinum. The gold strike of 1949 in the Yukon river area northeast of Fairbanks failed to develop in 1950. The few claims which revealed possible bonanza production could show no colour worthy of production on large-scale operation.

**FILMS OF 1950.**—*Eskimos—Winter in Western Alaska* (Encyclopædia Britannica Films Inc.); *Invisible Rampart* (United World Films, Inc.) (L. M. W.)

**Alaska Highway:** see ROADS AND HIGHWAYS.

**Albania.** A people's republic in the western part of the Balkan peninsula. Albania is bounded north and east by Yugoslavia and south by Greece, and has an Adriatic coast of 200 mi. Area: 10,629 sq.mi.; population: (1930 census) 1,003,097; (mid-1950 est.), 1,300,000. Language: literary Albanian and two spoken dialects, the Gheg north of the river Shkumbi and the Tosk in the south. Religion (1949 est.): Moslem 820,000, Greek Orthodox 280,000, Roman Catholic 115,000. Chief

towns (1949 est.): Tiranë (cap., 40,000), Scutari or Shkodër (30,000), Koritsa or Korçë (28,000), Elbasan (18,000). Chairman of the presidium of the People's assembly, Omer Nishani; prime minister, minister of foreign affairs and of national defense, Gen. Enver Hoxha.

**History.**—The Communist government remained subservient to soviet policy during 1950, and there was no change in the hostile attitude toward Greece and Yugoslavia. Hunger, approaching famine in winter, and widespread disease were the results of a year of political and economic isolation. This situation was only partially relieved at the end of the year by shipments of consumer goods and light industrial equipment from the Soviet Union and its satellites. Repeated government claims of success in industry through the employment of stakhanovite (Russian speed-up) methods and in agriculture by the development of the soviet collective system were exaggerated.

A realistic picture of the situation was given in March when four senior government officials, including the minister of industry, Abedin Shehu, were expelled from the central committee of the Communist party for what was termed "serious errors and mistakes in state and party work." On April 10 the prime minister, Enver Hoxha, addressing the second national conference of the party at Tiranë, stated that more than 5,000 "enemies of the people" had been chased by the defense corps over the border into Yugoslavia. The prime minister also condemned the minister of industry for the failure of the economic plan.

Two espionage trials, at which six Albanians were accused of spying on behalf of the western powers, preceded the general election on May 28. Full publicity given to the death sentences provided the electorate with a timely reminder of their expected loyalty to the regime. There were the usual single lists of Communist candidates, and official results claimed an outstanding victory. Out of 99.43% of the electorate who voted, 98.99% of the votes were cast for the Democratic front (Communist) candidates.

On May 30 Yugoslavia closed its legation in Tiranë after protesting against numerous frontier incidents and maltreatment of its diplomatic officials. During the year western diplomatic representation remained restricted to the French and Italian legations. Great Britain's attempts to obtain compensation, awarded by the International Court of Justice (*q.v.*), for the damage caused to its two destroyers by mines in the Corfu channel in 1946 were unsuccessful.

The United Nations Special Committee on the Balkans established that the government had actively interfered in Greek affairs by providing both the arms and the means for Greek Communists to return to Greece after they had received a period of political and sabotage training in Poland under soviet instruction. It was learned that the majority of Greek guerrillas who had escaped to Albania in 1948 had been removed by ship to Rumania and Poland.

In September there was a soviet month of culture and a Korean friendship week, during which funds were collected for the North Koreans. Delegations of technicians, workers, Greek Orthodox and Moslem clergy and peasants visited the U.S.S.R. to learn soviet methods. A soviet mission, composed of more than 3,000 technicians, directed the construction of a railway line from Durrës (Durazzo) to Tiranë and the erection of port installations at Vlorë (Valona). Despite the faithful allegiance of the government to Moscow, Albania was not granted membership in the Cominform, nor was it brought into the network of mutual aid treaties which bind all the other satellites to the Soviet Union.

The National Committee for Free Albania, composed of anti-Communist leaders in exile, continued its activity in Rome, and a New York, N.Y., office was opened. Hasan Dosti was appointed chairman, and Ihsan Toptani became the Albanian representative

on the eastern section of the European movement. (S. E. Ws.)

**Education.**—Schools (1949): elementary 1,909, pupils 162,000; higher elementary 145 and secondary 20, total pupils 19,140. A teachers' college was opened at Tiranë in 1946.

**Finance.**—Monetary unit: lek, until mid-1948 at par with the Yugoslav dinar, with an official exchange rate of 49.6 lek to the U.S. dollar.

**Transport and Communication.**—Roads (1949): 1,766 mi. Licensed motor vehicles (Dec. 1949): cars 500; commercial 1,200. Railways (1949): 62 mi. Shipping (1949): number of merchant vessels 6. Post and telegraph offices 53. Radio receiving sets (1949): 40,000.

**Agriculture.**—Main crops (metric tons): maize (1947) 140,000; wheat (1947) 54,000; tobacco (1945) 1,500; olives (prewar) 17,000; grapes (prewar) 14,000. Livestock: cattle and buffaloes (1945-46) 371,000; sheep (1946) 1,700,000; horses (1946 est.) 50,000; pigs (1946 est.) 35,000; goats (1946 est.) 854,000; asses (1946 est.) 40,000; mules (1946 est.) 10,000; chickens (1938) 2,000,000.

**Industry.**—Crude oil production (1949) 325,000 metric tons.

**BIBLIOGRAPHY.**—S. E. Watrous, "Isolation of Albania," *The Times*, London (Feb. 1, 1950); Vandeleur Robinson, "Albania: a Balkan Bridgehead," *The World Today*, London (Feb. 1950).

**Alberta.** Most westerly of the three prairie provinces of Canada, Alberta was created by parliament in 1905. Area: 255,285 sq.mi., of which 6,485 sq.mi. are water; pop.: (1941) 796,169, (1950 est.) 895,000; largest city: the provincial capital, Edmonton, (1950 est.) 150,000.

**History.**—A number of significant new laws were made at the 1950 session of the legislature. The government established power to participate in any demarcation of the boundary line between Alberta and the Northwest Territories or any adjoining province; broadened the dairymen's act to make all dairies, regardless of the smallness of their operations, purchase farmers' milk or cream on a butterfat basis; brought drugless practitioners and optometrists under boards of examiners appointed by the crown rather than boards elected by those associations, with licences directly under government control; gave the council of any city power to establish a \$1-per-day hospitalization scheme, with balance to be raised by a mill rate tax; empowered the provincial minister of health to enter into agreements with municipalities to provide nursing service of a preventive or urgent nature; extended safety inspection to quarries; authorized advances to municipalities for self-liquidating projects (water works, gas plants, lighting systems, etc.); and set up a rental control board to take over federal rental controls upon their expiry on April 1, 1951.

The 35-sq.mi. Leduc oil field reached a peak of 313 producing wells and showed proved reserves of 250,000,000 bbl.; other active fields brought Alberta's proved oil reserves to 1,000,000,000 bbl. (with estimates running to a maximum of 20,000,000,000 bbl.). John James Bowlen replaced J. C. Bowen as lieutenant governor.

**Education.**—Latest available revised statistics for provincially controlled schools were for the year ending 1947: total enrolment, 155,517; average daily attendance, 131,011; teachers, 5,308; total revenues, \$18,931,352.

**Finance.**—The provincial budget for the 1950-51 fiscal year was: revenue, \$77,213,000; operating expenses, \$51,018,000; capital expenses, \$23,658,000; surplus, \$2,537,000. The sum of \$19,000,000 was set aside from capital revenue reserves for the retirement of bonded debt. Total provincial debt on June 1, 1950, stood at \$110,000,000 (1936: \$167,000,000).

**Agriculture.**—Although 1950 wheat acreages declined, coarse-grain acreages increased. There were declines in poultry, egg and pork production caused by unfavourable developments in the United Kingdom market. Nevertheless, in general, farm economy stood at a high level. On Jan. 1, 1950, outstanding farm mortgages totalled \$8,500,000 (1937: \$39,700,000), and farm property was valued at \$1,350,000,000 (1937: \$685,000,000). Major agricultural statistics for 1949 included: field crops, \$244,000,000; livestock, \$233,400,000; dairy products, \$52,000,000.

**Industries.**—In 1950, 43 new industries were established, 25 of them in Edmonton and related to the booming oil trade (tanks, pipe, bits, perforating guns, etc.). A \$10,000,000 pulp and paper mill was started on the Saskatchewan river near Edmonton. Estimated total value of 1950 manufactured goods was \$500,000,000 (1949: \$450,000,000; 1948: \$400,000,000).

**Minerals.**—During 1950, 300 oil companies spent \$150,000,000 on exploratory drilling for oil, with an average of two wells per day brought into production. By Sept. 1, 1950, production capacity was 170,000 bbl. per day, but actual production was restricted to 81,000 bbl. per day (stepped up to 99,269 bbl. by Nov. 20) because of limited market. The province made natural gas wastage (by burning in flares at wells) illegal. The \$90,000,000, 1,150-mi. pipe line connecting Edmonton with Regina, Sask., and Superior, Wis., was begun May 1 and completed Oct. 31, and oil began moving. Total daily initial capacity was 90,000 bbl. with 140,000 bbl. daily peak capacity. (See also CANADA.)

(C. Cy.)

**Alcohol, Industrial.** United States production during the year 1949-50 of ethyl alcohol at plants principally for industrial use was 313,535,129 proof gallons, compared with 351,015,364 gal. in 1948-49. However, production speeded up after June, the period July through Oct. 1950 giving 143,126,449 proof gal., as compared with 95,869,414 gal. during the same period of 1949.

Stocks were drawn down some as the synthetic rubber program expanded.

The Reconstruction Finance corporation contracted with France for the purchase and delivery (mostly in 1951) of 120,000,000 gal. at 63 cents per gallon. One undecided problem at the end of the year was whether surplus potatoes would be converted into alcohol—one major distillery was reported as offering to produce potato alcohol from government surplus potatoes at 95 cents per gallon, the price already being paid for alcohol from grain.

**Alder, Kurt** (1902- ), German chemist, obtained the degree of doctor of philosophy from the University of Kiel, where he was a pupil of Otto Diels (*q.v.*). He was appointed extraordinary professor of chemistry at Kiel in 1934 but later went to occupy the chair of chemistry and chemical technology at Cologne. In 1950 the Nobel prize for chemistry was awarded jointly to Diels and Alder for their work on diene synthesis (the Diels-Alder reaction). Diene synthesis is concerned with the formation of complex organic compounds such as plastics and is of great practical as well as theoretical importance. The discovery was regarded as an outstanding achievement of organic chemistry. Their first paper on the reaction was published in 1928. Alder, who was still working on the diene synthesis in 1950, made important contributions to the stereochemistry and the energetics of the process.

(W. J. BP.)

**Alemán, Miguel** (1903- ), president of Mexico, was born on Sept 29 in Sayula, Veracruz, Mexico. He studied at the National Preparatory school in Mexico City and later at the National University of Mexico, where he received his law degree in 1928. He was successively consulting attorney for the Mexican ministry of agriculture; judge of the federal court; senator from Veracruz; governor of that state (1936-40); and minister of the interior under Pres. Manuel Avila Camacho. Alemán was elected president of Mexico in 1946. Throughout his presidency he was a champion of inter-American unity, and he worked closely with U.S. officials in promoting political and economic solidarity throughout the hemisphere. Domestically his program emphasized education, especially the end of illiteracy; industrialization; irrigation and modernization of the practices of agriculture, source of income for 70% of the population; and encouragement of the tourist trade. His police quickly ended a leftist-led strike demonstration in Jan. 1950, by jailing 800 striking taxi drivers. In pursuit of his emphasis on rural improvement, he approved in April the granting to women in Mexico of the same rights to own land and obtain credit which men enjoyed. Plans were disclosed to train farm women in farming and homemaking, and to improve medical services.

**Aleutian Islands:** see ALASKA.

**Alfalfa:** see HAY.

**Algeria.** A French territory of North Africa, Algeria is situated between Morocco (west) and Tunisia (east), with a status of government-general of the French union. Total area: 846,124 sq.mi., administered in two parts: northern Algeria (80,966 sq.mi.), comprising the overseas *départements* of Algiers, Oran and Constantine, and the four territories of southern Algeria (765,158 sq.mi.). Pop.: (1948 census) 8,681,785, including 816,993 (9.4%) in the southern territories; (1949 est.) 8,751,000. Arabs and Berbers constitute 86.7% of the population; they are Moslem and speak Arabic, though the countryfolk of Kabylia still use the Berber tongue. There was a flourishing Jewish community estimated in 1949 at 130,000. Chief towns (1948 census): Algiers (cap., 315,210); Oran (256,661); Constantine (118,774); Bône (102,823); Tlemçen (69,668). Governor general: Marcel Edmond Naegelen (appointed in 1948).

**History.**—Despite constant bitter attacks by the Nationalist Democratic Union of the Algerian Manifesto (U.D.M.A. or Union Démocratique du Manifeste Algérien, led by Ferhat Abbas) in its organ *La République algérienne*, and notwithstanding violent pan-Arab opposition by the Movement for the Triumph of Democratic Liberties (M.T.L.D. or Mouvement pour le Triomphe des Libertés Démocratiques, led by Messali Hajj), conditions remained calm during 1950. Public opinion appeared little disturbed by the plot engineered by the paramilitary organization of the M.T.L.D., which in April led to many arrests. Of greater importance was the action taken by the ulemas to ensure the independence of the Moslem faith in relation to the state and to develop the teaching of Arabic. The president and vice-president of their association in December visited Paris to petition the government for full religious liberty. Under the education scheme 500 new classes with capacity of 25,000 pupils were opened for instruction in French. The extension by special enactment of the term of office of Governor General Naegelen, which by a statute of the national assembly (of which he is a member) was due to expire in August, gave rise to discussion.

**Finance.**—Budget (1950-51 est., the fiscal year beginning April 1): revenue 72,530,100,000 fr., expenditure 72,508,900,000 fr. Monetary unit: Algerian franc=metropolitan franc, with an exchange rate of 349.9 fr. to the U.S. dollar (free rate) in Nov. 1950.

**Foreign Trade.**—(1949) Imports 127,521,000,000 fr.; exports 88,709,000,000 fr.

**Transport and Communications.**—Railways (1947): 4,338 km. Metalled roads (1947): northern Algeria 52,519 km., southern Algeria 282 km.; nonmetalled roads: 15,046 km.; tracks: 20,575 km. Motor vehicles licensed (Jan. 1948): cars 26,165; trucks 19,895. Ships entered (1949): Algiers 3,041, Oran 2,437; cargo unloaded (in all ports) 2,910,200 metric tons, loaded 5,811,800 metric tons. Air transport (1949): aircraft landed 10,916; passengers flown: arrivals 118,700, departures 147,000; freight carried (metric tons) 19,324, mail 860. Telephone subscribers (1949): 56,000.

**Agriculture.**—Main crops (metric tons, 1949): wheat 946,400; barley 890,400; oats 142,300; citrus fruits 223,000; olives 125,000; figs 80,000; dates 105,000; tobacco 20,000; vegetables 544,000; wine 14,467,000 hl. Livestock (1949): cattle 747,000; sheep 3,839,000; goats 2,596,000; pigs 160,000; horses 204,000; asses 255,000; mules 230,000; camels 138,000.

**Industry.**—Mineral production (metric tons, 1949): phosphate rock 644,800; coal 258,000; iron ore 2,536,900; zinc ore 17,400. Industrial production (metric tons, 1949): pig iron 6,418,000; steel 893,000; copper 3,721,000; cement 128,000,000; superphosphates 87,888,000; telephonic cables 4,193,000; matches 128,000,000 boxes.

(C. A. J.)

**Alien Property, Office of:** see FOREIGN INVESTMENTS.

**Aliens.** United States.—By using the true figures for immigration and naturalization and estimating alien mortality for the period of registration, it is possible to arrive at the approximate alien population. On such a basis it is estimated that there were approximately 3,000,000 resident aliens in the continental United States on June 30, 1946. This estimate does not take into account persons there temporarily, that is, non-immigrants, border crossers and imported labourers.

**Naturalizations.**—There were 66,346 petitions for naturalization granted to noncitizens during the year ended June 30, 1950. Thus the number of persons naturalized continued to re-

main at the low level that had been maintained for the several years following World War II, when in the five years from July 1, 1940, through June 30, 1945, there were 1,500,000 naturalizations, or an average per year of 300,000.

The following table shows the principal countries of former allegiance of persons naturalized.

Former nationality	Years ended June 30			
	1950	1949	1948	1947
British . . . . .	12,697	13,284	12,361	20,328
Canadian . . . . .	5,882	5,347	3,860	*
German . . . . .	6,065	5,777	7,486	10,703
Italian . . . . .	8,743	8,301	9,452	11,516
Polish . . . . .	3,793	4,371	5,136	6,495
U.S.S.R. . . . .	2,122	2,752	3,143	3,562
Filipino . . . . .	3,257	3,478	5,768	10,764
Other . . . . .	23,787	23,284	22,944	30,536
Total . . . . .	66,346	66,594	70,150	93,904

\*Included with British.

There were 2,276 petitions for naturalization denied by the courts during 1950. Included in this number were 1,537 cases denied for want of prosecution. In most of these cases, however, the petitioner for naturalization failed to prosecute the petition after notice that the petition would be recommended for denial on the merits of the case. The petitioner failed to establish good moral character in 139 cases. In 151 cases he failed to establish sufficient knowledge and understanding of the principles of the constitution. Only 40 petitions for naturalization were denied on the ground that the petitioner had failed to establish attachment to the principles of the constitution of the United States and favourable disposition to the good order and happiness of the United States.

Of the 415 judgments of naturalization revoked, 392 were cases in which the foreign service of the department of state initiated action because naturalized citizens became residents of foreign states within five years of naturalization. In 23 cases action was initiated by the immigration and naturalization service because naturalization was fraudulently or illegally procured.

In addition to those persons whose United States citizenship was revoked, there were 5,792 persons who expatriated themselves by affirmative action; 1,693 by voting in a foreign political election or plebiscite; 1,096 through naturalization in a

foreign state; 1,424 by taking up residence in a foreign state; 721 by serving in the armed forces of a foreign state; 109 by departing from the United States to avoid military service and for other reasons.

**New Legislation.**—On April 20, 1950, S. 3455—an omnibus bill having as its objective the complete revision of immigration and nationality laws—was introduced in the senate. Possibly because of this measure, which would include changes embodied in other independent bills, there were few public laws relating to immigration and nationality passed in the fiscal year.

One of the more important legislative enactments of the year affecting the work of the immigration and naturalization service was public law no. 555, approved June 16, 1950, which amended the Displaced Persons act of June 25, 1948. Under the amending act the number of refugees and displaced persons who might be admitted to the United States was enlarged to a grand total of 415,744. Provisions of the 1948 act which were challenged as discriminating against racial and religious groups were eliminated. Additional safeguards were provided against the entry of those whose admission to the United States would be against the national interest. Primary responsibility for administering the statute remained in the Displaced Persons commission. However, the department of state was given authority to determine eligibility for certain groups outside Germany and Austria. While the Displaced Persons commission generally was empowered to determine the eligibility for benefits under the statute, its determinations were subject to veto power entrusted to the foreign service of the department of state and the immigration and naturalization service. The service also had continuing responsibility arising from section 4 of the act, as amended, relating to adjustment of status of displaced persons residing in the United States, and to the general requirements of the act concerning admissions under the immigration laws and deportation actions. The date for issuance of visas under the Displaced Persons act generally was extended to June 30, 1951, although in some instances (such as applicants who were orphans or German expellees), visas might be issued until June 30, 1952.

The amendment of the act added provisions which increased the responsibilities of the service. No visa may be issued to any alien whose admission must be based upon the submission of an assurance of suitable employment unless and until he executes a signed statement accepting and agreeing in good faith to abide by the terms of employment provided in the assurance. Upon a finding that the statement was falsely made, the alien is to be deported.

Every displaced person admitted on the basis of an assurance of employment must report, on Jan. 1 and July 1 of each year until four reports have been made, respecting the nature and place of his employment and the place of residence of himself and members of his family. Wilful violation of this requirement, enforcement of which lies with the service, renders the alien subject to a fine of up to \$500 or imprisonment up to six months.

No visa may be issued to any displaced person whose admission would be against the national interest. Upon arrival at a port of entry the displaced person must take and subscribe an oath of affirmation that he is not and has never been a member of any organization or movement contrary to the United States and its form of government. If the oath is wilfully false, the alien may be prosecuted for perjury. If one not entitled to a visa under these provisions nevertheless gains admission he is to be taken into custody and deported.

Public law 587, approved June 30, 1950, was another law making quota provisions for a special group of immigrants. It provided relief for the sheep-raising industry by making 250 special quota immigration visas available to certain alien sheepherders

"EXPORTABLE SURPLUS," a cartoon by Alexander published in the *Philadel. Evening Bulletin*, in 1950

for a period of one year. (See also IMMIGRATION AND EMIGRATION; LAW.)

(A. R. MY.)

**Great Britain.**—The number of aliens of more than 16 years of age registered in the United Kingdom on Oct. 1, 1950, was 426,437 (males 261,915; females 164,522). The principal nationalities represented and the numbers of each compared with similar figures at the same date in 1949 were: Austrian 10,037 (11,034); Belgian 5,520 (6,467); Chinese 9,725 (9,367); Czechoslovak 6,017 (7,207); Dutch 9,117 (9,158); Estonian 5,599 (5,816); French 14,901 (14,087); German 47,762 (44,249); Hungarian 4,996 (5,536); Italian 21,672 (18,667); Latvian 13,794 (13,855); Lithuanian 6,860 (7,165); Norwegian 5,966 (5,868); Polish 145,524 (150,378); Russian 38,172 (40,785); Swiss 12,878 (13,107); U.S. 18,283 (16,656). The figures included 11,000 aliens to whom no nationality could be attributed.

The flow of foreign passenger traffic through United Kingdom ports continued to be heavy, and the number of incoming travelers remained at nearly 650,000. In July 1950, 114,738 foreigners landed at United Kingdom ports and 97,062 embarked. Similar figures in July 1949 were 101,768, and 84,076. As a result of individual visa agreements, nationals of the following countries were not required to obtain visas for travel to the United Kingdom: Belgium, Denmark, France, Iceland, Italy, Liechtenstein, Luxembourg, Monaco, the Netherlands, Norway, San Marino, Sweden, Switzerland and the United States.

By Oct. 1, 1950, about 77,000 aliens, mostly of Polish or Baltic origin, who had been temporarily accommodated in displaced persons camps on the continent, had been admitted for employment in the United Kingdom with a view to settlement. With them came nearly 4,000 dependents. These foreigners were restricted to employment in undermanned industries but from Jan. 1, 1951, those with three years' residence would be free to take any work they could obtain.

Out of the 174,000 Polish servicemen brought to the United Kingdom after mid-1945, 61,500 were repatriated and 17,000 assisted to emigrate. The remainder settled in civilian life in Great Britain and 31,000 persons dependent on them were brought from abroad to join them. During 1950 about 2,000 more Polish refugees were admitted from the Lebanon and east Africa.

Between Jan. 1 and Oct. 1, 1950, 5,702 new applications for naturalization were lodged, compared with a yearly average of 1,708 before World War II and 5,610 for the same period in 1949. Certificates granted during the same period numbered 5,197, an annual rate of approximately 6,950 as compared with 9,066 in 1949.

(T. G. W.)

**Alimentary System, Disorders of.** **Oesophagus.**—Rupture and bleeding from oesophageal varices are the primary cause of death in a high percentage of patients with cirrhosis of the liver, hence the use of sclerosing solutions in their treatment, or extensive surgical procedures such as splenectomy, splenorenal or portacaval shunting operations to reduce portal hypertension, and even transthoracic oesophagogastric resection. C. B. Barnett and Sidney Cohen treated a small series of patients with oesophageal tamponade, gavage and thrombin. A Miller-Abbott tube or its modification was used.

The importance of the psychosomatic or emotogenic factor in patients with irritable colon, cardiospasm, pylorospasm, anorexia nervosa, possibly peptic ulcer and chronic ulcerative colitis is generally conceded. Stewart Wolf, T. P. Almy and Catherine R. Lee reported their experimental observations on cardiospasm in 14 human subjects. Their studies indicated that the dilated, elongated and obstructed oesophagus of cardiospasm may be the end stage of a process which in early stages is re-

**ACCURACY OF INITIAL DIAGNOSIS** of the cause of jaundice made by (1) the liver biopsy, (2) clinical examination and (3) laboratory tests

versible, and which is never entirely static. In all patients it was possible to correlate episodes of symptomatic exacerbation and remission with variations in life situation, feeling state and attitude.

**Stomach and Duodenum.**—Numerous articles as well as an increasing number of texts on peptic ulcer continued to dominate the gastro-enterologic literature in 1950. The prevalence of this disease, especially duodenal ulcer

in adults and the important role it plays in the cause of disability and death were matters of much concern to physician and layman alike. Hence arises the interest displayed in aetiology in differentiation of small ulcerating gastric carcinoma from benign gastric ulcer, and in more effective methods of medical treatment. Of great interest to clinicians was the revelation by A. C. Ivy, M. I. Grossman and W. H. Bachrach of the multiplicity and interdependence of factors in the production of experimental ulcer in the rabbit and dog, and the superimposition of one factor on another. These observers also looked forward to the day when mutilating operations for ulcer would be unnecessary. The parasympatholytic chemical agent, bethanechol, is usually an effective one in the treatment of uncomplicated ulcer, especially if the drug is well tolerated. The results of vagotomy after a five-year follow-up of thousands of cases are almost identical with those of gastro-enterostomy.

Prolonged and excessive intake of milk (containing large amounts of calcium and phosphorus) and alkali in the treatment of peptic ulcer may cause damage to the kidneys, tendency to fixation in urinary calcium secretion, excessive calcium in the blood, tendency to supersaturation with calcium phosphate and deposition of calcium salts in body tissues, according to the observations of C. H. Burnett, R. R. Commons, Fuller Albright and J. E. Howard. Clinical improvement followed intake low in milk and alkali.

Does hypersecretion of gastric juice exist prior to the development of ulcer, duodenal ulcer in particular? Follow-up study on 100 normal medical students subjected to histamine test meals 15 years earlier was undertaken by R. Doll, F. A. Jones and N. F. MacLagan (London). Subsequent medical histories were obtained on 85 of the original group. The results indicated that hypersecretion is a cause rather than an effect of ulcer.

R. C. Batterman and I. Ehrenfeld concluded, after investigation, that tobacco smoking is detrimental to the peptic ulcer patient.

**Hepatobiliary and Pancreatic Systems.**—Experiences in differential diagnosis of jaundice by needle biopsy of the liver were reported by F. G. Weisbrod, L. Schiff, E. A. Gall, F. P. Cleveland and J. R. Berman. From 157 patients with jaundice, 181 adequate liver biopsies were obtained. The chart shows that diagnosis based on biopsy was much more reliable than that based on the combined results of certain tests of liver function, namely cephalin flocculation, thymol turbidity and serum alkaline phosphatase determinations in the various forms of jaundice studied. Errors in differentiating virus hepatitis from obstructive jaundice on the basis of needle biopsy under certain circumstances were pointed out. Diagnostic efficiency improved as the

person performing the biopsies and the pathologist interpreting them became more experienced.

The detection of chronic pancreatitis in its earlier stages had been exceedingly difficult. The familiar symptoms and signs characterize the advanced stage of the disease. Further progress apparently depends on results of tests of pancreatic function. Norms were established for total secretory volume, concentration of bicarbonate and total bicarbonate and amylase responses to a standard commercially available preparation of secretin. A study of the data by D. A. Dreiling and Franklin Hollander yielded evidence making necessary the use of an 80-min. collection period, and the inclusion of enzyme determinations in the clinical application of the procedure. Body weight adjustment of the values for total volume of secretion and total quantity of amylase results in a marked decrease in a scatter of the data, and therefore narrowing of the range of normalcy. For this reason volume and enzyme data should be reduced to a per kilogram basis.

As early as 1923, B. B. V. Lyon reported finding cancer cells in the duodenal secretions, but this aspect of cytologic diagnosis was not pursued. G. McNeer and J. H. Ewing diagnosed pancreatic carcinoma in two cases from the presence of exfoliated cancer cells in the duodenal secretions. Several months later H. M. Lemon and W. W. Byrnes reported observations on 16 cases.

**Intestines.**—Sulfonamides reduce the carrier rate following the acute phase of bacillary dysentery, but reports were contradictory as to their efficacy in other respects during this phase. Streptomycin is uniformly effective in relieving the symptoms of tuberculous enteritis. H. H. Anderson and his associates found the thioarsenates highly effective and superior to all other arsenical amoebicides. Aureomycin in the treatment of patients with refractory amoebiasis was followed by encouraging results. The potency of chloroquine in the treatment of hepatic amoebiasis was amply confirmed by various authorities.

**FILMS OF 1950.**—*Human Digestion* (Athena Films, Inc.). (G. B. EN.)

**Allergy.** Numerous workers in the field of allergy studied the effects resulting from the use of ACTH (adrenocorticotrophic hormone) and cortisone in hay fever, asthma, hives and eczema. M. Samter used ACTH in six asthma patients and reported good relief. H. M. Caryer, G. A. Koelsche, L. E. Prickman, C. K. Maytum, C. F. Lake and H. L. Williams used cortisone in three patients with asthma and hay fever and reported relief within three days after treatment began. The symptoms of asthma were helped more readily than those of hay fever. R. A. Carey, A. McGehee Harvey, J. E. Howard and W. L. Winkenwerder treated 23 asthma patients with either ACTH or cortisone. With the former, 15 of 19 patients were completely relieved while under treatment. After cessation of treatment the period of relief varied from three days to as long as ten months in one patient. Cortisone, used on only five patients, was less effective than ACTH.

The fundamental nature of the allergic state was not changed by the use of either ACTH or cortisone. M. Zeller and T. G. Randolph found no change in the skin reactions or in the sensitizing properties of the blood serum in pollen-sensitive patients who received ACTH. J. Leger, W. Leith and B. Rose found that ACTH, even in massive doses, did not prevent anaphylaxis in guinea pigs. E. F. Fischel found no effect on antibody formation or on the reaction between antigen and antibody in animals treated with ACTH.

GLASS MICROSCOPE SLIDE shown anchored to a window ledge 12 stories above street level in St. Louis, Mo., where it provided the city's daily pollen count during 1950. After 24 hours' exposure, pollen grains and plant spores adhering to the glass made sticky with glycerine jelly were stained and counted at 9 A.M. six days a week, and the figures relayed to the local office of the U.S. weather bureau

The basis for the relief of allergy symptoms by these substances was not clarified in any of the publications. B. Rose found a marked decrease in the excretion of histamine in the urine when ACTH was used in patients with asthma. This seemed to indicate a decrease in histamine release in the tissue. M. Samter suggested that the mesenchymal tissues of the bronchi were altered by ACTH so that they were refractory to the effect of substances released during the allergic reaction.

The need for caution in the use of other drugs in allergic cases was emphasized in a number of reports. A. W. Hilker reported the development of a marked reduction in white blood cells (agranulocytosis) following the use of pyribenzamine. J. J. Crumbley, Jr. reported a serious haemolytic type of anaemia which developed in three patients following the use of other antihistamines. R. J. Burleson described an anaphylactoid shock resulting from the administration of penicillin.

An interesting new cause of typical hay fever symptoms during the summer was described by G. E. Gaillard. The aphid (plant louse) was found to be the cause of symptoms in 75 out of 121 patients who had summer and late fall hay fever symptoms not explained by pollen sensitivity. The patients, who lived in the vicinity of White Plains, N.Y., had positive skin reactions to extracts of aphid, and their blood contained skin-sensitizing antibodies to this substance.

Consumption, primary . . .	671.1	696.8	575.7	571.8	684.6	636.0

Following a sharp decline in the last quarter of 1949, production was stepped up in 1950 to the highest level since 1944, with a total of 527,764 tons in the first three quarters.

**Canada.**—Production increased from 367,079 tons in 1948 to 369,466 tons in 1949, but exports declined from 328,551 tons to 288,364 tons. (G. A. Ro.)

**Ambassadors and Envoys.** The following is a list of ambassadors and envoys to and from the United States, Jan. 1, 1951.

To the United States	Country	From the United States
*Naim, H.R.H. Sarder Mohammad . . .	Afghanistan	*Dreyfus, Louis G., Jr.
*Remorino, Jerónimo . . .	Argentina	*(Vacancy)
*Makin, Norman J. O. . . .	Australia	*Jorman, Pete
Kleinwachter, Ludwig . . .	Austria	Donnelly, Walter J.†
*Silvercrucis, Baron . . .	Belgium	*Murphy, Robert D.
*Martinez Vargas, Don Ricardo . . .	Bolivia	*Florman, Irving
*Nabuso, Mauricio . . .	Brazil	*Johnson, Herschel V.
*Barrington, James . . .	Bulgaria <sup>2</sup>	
	Burma	*Key, David McK.
*Wrong, Hume . . .	Cambodia	Heath, Donald R. <sup>3</sup>

**American Citizens Abroad.** On Jan. 1, 1950 the number of U.S. citizens residing abroad had increased 50,744 over the number of similar residents on Jan. 1, 1949. The increase of resident U.S. citizens in South America was more than 2,000, and in Central America and Mexico was approximately 8,000. Canada, Newfoundland and Iceland received an increase of more than 10,000 and the

West Indies and Bermuda 6,000. Outside the western hemisphere the greatest gain, 8,500, was in Europe. The increase in the Philippines was more than 7,500 and in Asia generally about 7,000. Australia and New Zealand gained about 1,000, while the continent of Africa, the only large area to register a diminution in U.S. residents, lost 112. The total increase represented a variety of the usual occupations and professions, no single one registering any remarkable gain. It represented a normal increase in the number of U.S. citizens residing abroad for longer vacations, for improvement in health, for reasons of business and for educational, philanthropic and missionary activities. During the year other U.S. citizens proceeded abroad temporarily for the same reasons and in addition many thousands made Holy Year pilgrimages. The number of passports granted to U.S. citizens in the calendar year 1950 exceeded any previous year by more than 30,000.

Detailed figures on U.S. citizens residing abroad in 1950 are as follows:

<b>South America</b>		
Argentina . . . . .	4,600	
British Guiana . . . . .	201	
Bolivia . . . . .	841	
Brazil . . . . .	7,825

## American Library Association.

The oldest professional association in the world of librarians and others interested in the educational, social and cultural responsibilities of libraries, the American Library Association (A.L.A.) is the official organization of li-

brarians in the United States and Canada. Established on Oct. 6, 1872, in Philadelphia, Pa., the A.L.A. had a membership in 1950 of about 20,000 in the U.S. and possessions, Canada and more than 50 foreign countries. It is affiliated with more than 70 other library associations throughout the world. In 1950 the association had an endowment capital of approximately \$2,171,000 and a total income of about \$773,000. Headquarters are located at 50 E. Huron St., Chicago 11, Ill., with John MacKenzie Cory executive secretary.

A record attendance of 1,640 gathered at the annual midwinter meeting which convened in Chicago, Jan. 26-29, 1950. In place of the seven regional meetings held in 1949, the A.L.A. held its 69th annual conference in Cleveland, O., July 16-22, 1950. Future conference plans called for a midwinter meeting in Chicago, Jan. 30-Feb. 3, 1951; the celebration of the association's 75th anniversary at the annual conference in Chicago, July 8-14, 1951; and an annual conference in New York city, June 29-July 5, 1952.

Officers, elected by ballot, who assumed their duties at the annual conference were: president, Clarence R. Graham, Louisville Free Public library, Louisville, Ky.; first vice-president and president elect, Loleta D. Fyan, Michigan State library, Lansing, Mich.; second vice-president, Harriet D. MacPherson, Drexel Institute of Technology, Philadelphia, Pa.; and treasurer, R. Russell Munn, Akron Public library, Akron, O.

The annual A.L.A. citations for distinguished service as library trustees were awarded to Mrs. William H. Wills, Montpelier, Vt., and Anthony J. Cerrato, Yonkers, N.Y. The 29th Newbery medal was received by Marguerite de Angeli for *The Door in the Wall*, judged to be the most distinguished children's book of 1949. Leo Politi received the 13th annual Caldecott medal for his *Song of the Swallows*, chosen as the best illustrated children's volume of the year.

Halsey William Wilson, president of the H. W. Wilson Co., N.Y., received the Joseph W. Lippincott award (\$500) from the donor for having developed many outstanding bibliographical aids for the field of librarianship.

The Ada McCormick *Letter* librarian award (\$100) was received by Eva Santee, librarian of the Vancouver, Washington, Public library, for an outstanding demonstration of the human qualities of librarianship. The United States Information Service library at Prague received the *Letter* library award for "a demonstration of democratic library service abroad in bringing an accurate presentation of American life through books, periodicals, films and music to the people of Czechoslovakia."

The Field Citations for Library Recruiting were presented to the Louisiana Library association (\$300), the Pennsylvania Library association (\$200), and to the Brooklyn Public library (\$100).

Eleven libraries were presented with the 1950 John Cotton Dana Publicity awards, sponsored by the *Wilson Library Bulletin* and the A.L.A. Public Relations committee, for effective public relations programs.

At the 1950 annual conference in Cleveland, O., the A.L.A. adopted a resolution on loyalty programs in which it opposed the requirements of blanket loyalty oaths other than the regular affirmation of allegiance to the government and defined what it considered to be a fair hearing in cases of investigation.

Of considerable importance to the public library field in 1950 was the publication of the full report of the Public Library Inquiry in a series of books, with a summary volume entitled *The Public Library in the United States*. This study, carried out under the direction of Robert D. Leigh, was made possible by a two-year grant from the Carnegie corporation to the Social Science Research council.

Early in 1950 Marshall Field, whose grandfather was born in

Conway, Mass., made a grant of \$36,500 for a two-year demonstration of a co-operative library service in 12 communities in the Conway area. The participating libraries would share the services of two library specialists and would benefit from a pool of printed and audio-visual materials.

United States occupation authorities in Japan were to begin operation of a library school early in 1951 under a contract signed with the American Library association. Plans called for training Japanese librarians in modern techniques of librarianship by the A.L.A. with emphasis on practical aspects of library service to children and adults.

The association continued its work on library legislation and extension, the increase of co-operative film circuits, new minimum requirements for library schools and international library co-operation.  
(J. Mac. C.)

**American Literature.** The confusion and uncertainty in the United States in 1950 shaped the writing of the year. A country which had not yet fully assimilated World War II found itself suddenly confronting a new war. The kind of books people wrote and the kind they read reflected the political, diplomatic and military confusion of the year. But chaos did not check the flow of printed matter. Relatively few of the new books were noteworthy. Creative writers inaugurated no new trends in fiction or poetry, nor were there even many distinguished contributions in established veins. Instead, it was a year of looking backward; there were a remarkable number of books devoted to solid basic scholarship in American history, and a good many novels which recreated historic figures or eras. And it was a year in which a torrent of nonfiction documented the chaos.

The reading public, however, responded to the new tensions by turning in great numbers to three controversial books. Gayelord Hauser's *Look Younger, Live Longer* promised peace of soul through yeast, yogurt and hormones. L. Ron Hubbard propounded a new science of mental health through special techniques of self-psychoanalysis in his *Dianetics*. Immanuel Velikovsky's *Worlds in Collision*, an explanation of ancient historic events in terms of two series of cosmic catastrophes, roused such a storm over its veracity and sincerity that its original publishers handed over the rights to another publishing house.

Inevitably, at the outbreak of war in Korea, many books on Asiatic politics and history appeared, in addition to a steady flow of books about world politics, many of them outdated at publication by the swift pace of history. Of the books devoted to the actual scene of the new fighting, *Korea Today*, by George McCune and A. L. Grey, written before the outbreak of hostilities, was valuable as background material. Valuable on a wider plane was Owen Lattimore's *Pivot of Asia*, a study of the Asian frontiers of China and Russia. Two other books on Asia were Foster Bowman Hailey's *Half of One World*, a report on Asiatic political conditions, and Bruno Lasker's *Human Bondage in Southeast Asia*.

Two excellent books appeared which discussed countries not so directly involved in the conflict. Thomas Sugrue described the birth of Israel in *Watch for the Morning*, one of the best of the many books on Israel. Frank Tannenbaum's *Mexico, the Struggle for Peace and Bread* was a powerful picture of Mexico in the 20th century with especial emphasis on the revolutionary years. Hanson Baldwin wrote *Power and Politics*, a series of essays on Russia and the western world in which he advised a combined economic and military strengthening against communism. Willard Espy's *Bold New Program* was a sympathetic discussion of the Point Four program and its projected help to the undeveloped areas.

The stream of books about World War II continued, many of

them memoirs of military figures. Frank Howley's *Berlin Command* and Lucius Clay's *Decision in Germany* described U.S. military government in Germany. Mark Clark told the inside story of the Italian campaign in *Calculated Risk*, Robert L. Eichelberger covered the ground war in the Pacific in *Our Jungle Road to Tokyo*, and Adm. William D. Leahy, in *I Was There*, reported his personal observations from France in 1941 through Cairo, Teheran, Yalta and Potsdam. *The Road to Pearl Harbor*, by Herbert Feis, was a solid history of the events leading up to Dec. 7, 1941. Hanson Baldwin's *Great Mistakes of the War* analyzed both the military and political errors of World War II.

**The American Scene.**—The most important aspect of the scene in the United States was the problem of "loyalty," security and freedom of speech. A flood of books documented the country's confusion as exemplified in such episodes as the Alger Hiss trial and the University of California loyalty oath controversy, and discussed the general problems of the witch-hunt and communism. Walter Gellhorn's *Security, Loyalty, and Science* analyzed the dangers to scientific workers of the screening process. Carey McWilliams, in *Witch Hunt*, related the present purges to similar episodes in history. And Nathaniel Weyl wrote *Treason*, a survey of disloyalty and betrayal in U.S. history up to the Hiss case. U.S. political history came under scrutiny in such books as Herbert Agar's *The Price of Union* and Arthur M. Schlesinger's *The American as Reformer*.

A host of books dealt with specific episodes. Owen Lattimore's *Ordeal by Slander* included evidence which he had not been permitted to give during the investigation of his loyalty. George Stewart and a group of unnamed University of California professors joined to write *The Year of the Oath*, a history of the refusal of professors to sign a special test oath. Two books documented the Hiss trial. Ralph de Toledano and Victor Lasky, in *Seeds of Treason*, defended the proposition that Hiss had betrayed his country. Alistair Cooke, a British reporter who covered the trial, wrote *A Generation on Trial*, a more objective study of the facts and issues. Max Lowenthal's *The Federal Bureau of Investigation* was a controversial report on that group. Haywood Patterson's *Scottsboro Boy* told the story of an earlier trial and of jail terror.

Although many of the books on the current scene were little more than journalism, a good number had solid content and wide interest. *The Human Use of Human Beings*, by Norbert Wiener, expert on the electronic brain, was an effort to evaluate the machine in society. Although sometimes fumbling, the book was a major effort to deal with new facts and ideas and a plea for economic and moral support for scientist and artist. Anatole Rapoport, in *Science and the Goals of Man*, also dealt with the orientation of science and man. Crane Brinton's *Ideas and Men* was the story of western thought from the Greeks to the present time. And William J. Durant wrote *The Age of Faith*, a study of western and near eastern civilization from Constantine to Dante.

An important contribution to the understanding of radio, television, and motion pictures was Gilbert Seldes' *The Great Audience*. From a detailed analysis of the statistics and available facts, he reasoned that these mediums of mass communication were creating a stereotyped "mass man." Hortense Powdermaker, in *Hollywood, the Dream Factory*, applied the anthropologist's techniques to a study of the movie industry.

An exhaustive and scholarly study, *American Painting, History and Interpretation* by Virgil Barker, covered the 18th and 19th centuries. The final fruit of a Works Progress administration project of the 1930s was Edwin O. Christensen's *The Index of American Design*. This important work recorded practical, popular and folk art of the country. Bernard S. Myers wrote *Modern Art in the Making*, in which he discussed the relation of artists to social and economic patterns. Books on nature included

*A Cup of Sky*, essays on nature, the moon and planets by Donald Culross Peattie and his son Noel, and *The Country Wife*, essays on life in the Connecticut hills by Dorothy Van Doren. Langston Hughes gathered together a group of monologues on the Negro's status in the U.S., titling it *Simple Speaks his Mind*; and Alan Lomax wrote *Mister Jelly Roll*, an interesting account of the life of a jazz pianist.

**Memoirs and Historical Works.**—The year which saw a good deal of ephemeral writing in many fields brought at the same time an astounding wealth of historical works, many of them collections of documents and source materials. Two collections of Roosevelt documents appeared: *F.D.R.: His Personal Letters, 1929-1945*, edited by Elliott Roosevelt, and *The Public Papers and Addresses of Franklin D. Roosevelt*, compiled by Samuel I. Rosenman. *As FDR Said*, edited by Frank Kingdon, was a collection of quotations. John Gunther's popular *Roosevelt in Retrospect* attempted an appraisal of the president.

Five volumes appeared in the series "Chronicles of America," edited by Allan Nevins: *The Era of Franklin D. Roosevelt*, by Denis William Brogan; *From Versailles to the New Deal*, by Harold Underwood Faulkner; *The New Deal and World Affairs (1933-1945)*, by Allan Nevins; *The United States in a Chaotic World (1918-1933)*, by Allan Nevins; and *War for the World*, by Fletcher Pratt. Merle Curti published *An American History (1492-1763)*, the first of two volumes organized not on a chronological basis but on topics. Henry Steele Commager edited *The Blue and the Gray*, a volume of source materials on the Civil War.

There were a number of books for the general reader which were sound historically. Charles Allan Madison wrote *American Labor Leaders*, a history of labour unions for the past hundred years in terms of their leaders. Anita Lebeson's *Pilgrim People* was a thoroughly documented history of Jews in the western world. Robert Glass Cleland wrote about trappers and fur traders of the southwest from 1820 to 1840 in *This Reckless Breed of Men*.

Stewart Holbrook's *The Yankee Exodus* documented the migration of New Englanders into other parts of the continent. Amy Kelly's *Eleanor of Aquitaine and the Four Kings* was both sound scholarship and good reading.

Carl Van Doren's *Jane Mecom*, a biography of Benjamin Franklin's sister, recreated the life of ordinary people in Revolutionary times. Van Doren also edited *The Letters of Benjamin Franklin and Jane Mecom*. Catherine Drinker Bowen's *John Adams and the American Revolution* was a character study. Irving Brant's *James Madison, Father of the Constitution, 1787-1800*, the third volume of a series, was a scholarly work. Margaret L. Coit's *John C. Calhoun, American Portrait* was excellent for its picture of the times. Julian P. Boyd edited *The Papers of Thomas Jefferson: 1760-1776*, the first of 52 projected volumes. Adrienne Koch studied the relationship of two figures in *Jefferson and Madison; the Great Collaboration*, and Marie Kimball concentrated on Jefferson abroad in *Jefferson: the Scene of Europe 1784-89*. Allan Nevins wrote *The Emergence of Lincoln*, the first of two volumes of a critical biography. *The Lincoln Encyclopedia*, edited by Archer H. Shaw, was a collection of quotations arranged by subject matter. Lloyd Lewis' posthumous book, *Captain Sam Grant*, was a lively and scholarly account of Grant's career up to 1861.

**Fiction.**—Although some good new novels appeared in 1950, there were no striking developments in fiction and the quality of lesser novels was undistinguished.

Certainly the most talked-about book of the year was Ernest Hemingway's *Across the River and Into the Trees*, the story of an aging colonel, his loves, memories, opinions and manner of dying. The book was immoderately praised and damned. The condemnation rose not so much from the book itself as from the

NELSON ALGREN, U.S. novelist awarded the 1950 National Book award for fiction for *The Man With the Golden Arm*. Sponsored by the American Book Publishers council, the American Booksellers association and the Book Manufacturers institute, this was the first literary award to be presented by the U.S. publishing trade

critics' preconception of Hemingway's personality and prejudices. A glance through the critical essays collected by John K. M. McCaffery in *Ernest Hemingway: The Man and His Work* shows that from the beginning Hemingway's work and personality had elicited violent reactions. There was general agreement that he was a major novelist, but general disagreement on what elements in his work qualified him as such.

Many novels portrayed characters involved in special settings or with special problems. The most distinguished of these was John Hersey's *The Wall*, a novel in the form of a journal covering the final disintegration of the Warsaw ghetto under Nazi persecution. Although fundamentally a documentary book which drew upon real sources, *The Wall* brought alive people terrible in a universal suffering. James Aldridge, in *The Diplomat*, wrote the story of the political awakening of a young man attached to a distinguished empire-building British diplomat. The book, documentary like Hersey's but less dramatic, was a discussion of Persia (Iran) as a political football. In Christine Weston's *The World is a Bridge*, a small group of characters acted out India's conflicts. William L. Shirer, turning for the first time to fiction, used his knowledge of Germany in *The Traitor*, character study of a renegade. Ned Calmer's *The Strange Land* was one of the few novels directly using the war. He described an unsuccessful Allied offensive through the stream of consciousness of 12 people. Henry Morton Robinson's *The Cardinal* was a best seller. A story of a Catholic priest from poor parish to cardinal, it showed the workings of the church. Arthur Gordon's *Reprisal* was a grim, sometimes melodramatic story, offering no solution, of a Georgia lynching. Michael Amrine, in *Secret*, portrayed a physicist with a conscience about the atom bomb. Upton Sinclair wrote *Another Pamela; or, Virtue Still Rewarded*, a

pleasantly rambling review of contemporary social history.

Budd Schulberg's *The Disenchanted* ranked among the top books of the year. Based partly on the life of F. Scott Fitzgerald, it was a solid, mature treatment of a man's struggle with and for success. Besides subjecting Hollywood to biting criticism, it recreated, through a series of lengthy flash backs, the mood of the 1920s and contrasted it with that of the 1930s.

Robert Penn Warren chose Kentucky in the 1820s as a setting for *World Enough and Time*. The line of this story of love and politics was blurred by many of the trappings of the standard historical romance and by considerable cloudy philosophizing. Wallace Stegner, in *The Preacher and the Slave*, wrote a fictionalized biography of the immortal Wobbly, Joe Hill. Ben Ames Williams' *Owen Glen* told about a Welsh mining family in Ohio of the 1890s and its connection with the United Mine Workers.

Conrad Richter added *The Town* to his series of excellent documentary novels on the evolution from frontier life in the mid-west. Howard Fast wrote *The Proud and the Free*, a story of a rebellion of Revolutionary common soldiers against the officer gentry.

The number of historical romances was slightly smaller than usual. Thomas B. Costain's *Son of a Hundred Kings*, a novel of the 1890s in Canada, was a best seller. Samuel Shellabarger used a 16th century French setting for *The King's Cavalier*. Nancy Hale's *The Sign of Jonah* was one of the better panoramic historical novels, and Gwen Bristow's *Jubilee Trail* narrated the story of a bride travelling the Santa Fe trail to California in the mid-19th century.

The psychiatric novel and the novel of character continued in importance. Brendan Gill, in *The Trouble of One House*, revealed in the dying of a woman how she had been loved and hated in her life. Nancy Wilson Ross's *I, My Ancestor* was a perhaps too poetic treatment of a man's struggle to rearrange his psyche. Susan Yorke wrote *The Widow*, the story of a rapacious female in a South American setting. Laura Z. Hobson's *The Other Father* showed the late maturing of a man through his relationship with his daughter.

The playwright Tennessee Williams ventured into the field of fiction with *The Roman Spring of Mrs. Stone*, a not altogether successful treatment of the growing old of an actress.

Short stories gave a much richer relative yield than novels. *The Collected Stories of William Faulkner* headed the list. Faulkner's long-held position as an eminent U.S. writer was confirmed by the award to him of the 1949 Nobel prize in literature. The stories amply demonstrated the variety and maturity of his gift.

The stories in Paul Bowles's *The Delicate Prey* were of violence and death in an African setting. Mary McCarthy collected her sharply satirical pieces in *Cast a Cold Eye*. Walter Van Tilburg Clark's western stories, *The Watchful God, and Other Stories*, were too often marred by heavy symbolism. Irwin Shaw's *Mixed Company* was a group of neatly told stories often concerned with the impact of World War II. The stories in William Carlos Williams' *Make Light of It* were sketches of character. Other volumes of stories were James T. Farrell's occasionally sharp group on *An American Dream Girl*, Charles Jackson's *The Sunnier Side* and Jesse Stuart's Kentucky stories, *Clearing in the Sky*.

**Belles Lettres.**—Perhaps the most original contribution of the year was Henry Nash Smith's *Virgin Land*, a study of the west as myth and symbol in U.S. history and literature, which opened new dimensions in the area charted by Frederick J. Turner. Henry Steele Commager in *The American Mind* contributed on the whole the best survey of American thought from 1880 since the classic work of Parrington. Strongest in its chapters on the social sciences, it is rather querulous in those on literature.

Lionel Trilling, in *The Liberal Imagination*, collected his influential essays on literature and society. He criticized the liberal imagination from within the liberal camp, particularly its tendency, as in Parrington and Dreiser, to conceive "reality" and intelligence too narrowly.

While classic literary figures received their due number of sound scholarly studies, a more conspicuous phenomenon of the year was the number of books on contemporary figures. Books of criticism and collections of essays about writers signaled the fact that these 20th-century writers were now academically established as a group.

Of the studies of classical figures, several were about Herman Melville. Most important was Newton Arvin's addition to the "American Men of Letters Series," *Herman Melville*, the best critical survey of his work but not yet the needed authoritative biography. Others were M. O. Percival's *A Reading of Moby-Dick*, a sensitive interpretation, original in its analysis of Ahab's psychology in terms of Kierkegaard's concepts; and Henry Pommer's *Melville and Milton*.

Another title in the distinguished new "American Men of Letters" was John Berryman's *Stephen Crane*. Two books on Mark Twain appeared, Kenneth R. Andrews' *Nook Farm: Mark Twain's Hartford Circle* and Gladys C. Bellamy's *Mark Twain as a Literary Artist*, the first sustained attempt to assess his work in these terms.

Some of the critical works on contemporary writers were *William Carlos Williams* by Vivienne Koch, *An Examination of Ezra Pound* edited by Peter Russell, *The Shaping Spirit: A Study of Wallace Stevens* by William Van O'Connor and *The Art of T. S. Eliot* by Helen Gardner. Edgar Kemler's sympathetic biography, *The Irreverent Mr. Mencken*, reviewed the era as well as the subject.

A volume of great historical value and of interest in view of the controversy about the Bollingen prize of 1949, was *The Letters of Ezra Pound (1907-1941)*, edited by D. D. Paige. Kenneth Burke, the most philosophical of the new critics, wrote *A Rhetoric of Motives*, and Edmund Wilson collected in *Classics and Commercials* his often brilliant critical essays printed over a period of years.

**Poetry.**—Two responses to the year's tensions were demonstrated most clearly in the poetry of the year. One was to recapitulate, to collect, to put a period to the era. The other was symbolized by the suicide of F. O. Matthiessen, one of America's most brilliant and humane literary scholars.

Matthiessen's new edition of the *Oxford Book of American Verse* appeared, in general an excellent selection. Carl Sandburg, with the publication of *Complete Poems*, announced the end of his career as a poet. Conrad Aiken revised his "symphonic poems" and published them in *The Divine Pilgrim*. William Carlos Williams, who won the National Book award, gathered together *The Collected Later Poems*. Wallace Stevens wrote *The Auroras of Autumn* and received the Bollingen award. E. E. Cummings wrote *Xaïpe* (Chaire), 71 new poems, and also won the Academy of American Poets' fellowship.

Thus three talents once regarded as experimental won major awards and stepped over into the realm of public recognition as solid figures.

Other new volumes were Delmore Schwartz' verse with prose interludes, *Vaudeville for a Princess*; Peter Viereck's *Strike Through the Mask*, a book of lyrics plus an essay on "The Poet in the Machine Age"; and Ogden Nash's *Family Reunion*, poems in his inimitable manner on family situations. **Anaemia.** The treatment of special anaemias caused by changes in red blood cells received much attention during 1950 and the effectiveness of vitamin B<sub>12</sub> was the subject of many reports. One microgram per day of vitamin B<sub>12</sub> in patients with pernicious anaemia was confirmed as valuable. Vitamin B<sub>12b</sub> was also useful. These substances were of especial value in patients sensitive to liver extract, and in those with neurological involvement. The medication was most effective when given by injection, but oral administration could be enhanced by potentiators such as stomach or duodenal mucosa, folic acid or gastric juice from normal people. The blood-producing effect of gastric juice concentrate or beef muscle extract was found to be proportional to their vitamin B<sub>12</sub> content. Folic acid and vitamin B<sub>12</sub> were found to be synthesized in relatively large amounts in the large intestine, even in patients with pernicious anaemia. The vitamin was not effective in the treatment of large cell anaemia of pregnancy in ordinary doses although folic acid or large doses of vitamin B<sub>12</sub> caused an adequate improvement. There appeared to be a relation between folic acid, folinic acid and *Leuconostoc citrovorum* factor, and the possibility was suggested that folic acid, liver extract and vitamin B<sub>12</sub> were essential to the formation of nucleic acid and nucleoprotein through a chemical chain reaction.

Folic acid deficient monkeys failed to become anaemic when they were supplied with sufficient quantities of ascorbic acid, but folic-acid deficiency anaemia responded only to folic acid. This substance while producing an improvement in the blood in pernicious anaemia did not check or prevent the neurological symptoms. Vitamin B<sub>12</sub>, however, was effective in reversing these complications. Folic acid was not harmful to the central nervous system when used in the treatment of other types of anaemia.

Patients with pernicious anaemia had a special predisposition to cancer of the stomach, the rate being three times that expected of a corresponding age group and more than six times as frequent as in a group showing achlorhydria or hypochlorhydria.

Some infants with megaloblastic anaemia, patients with a tropical sprue and adults with cirrhosis of the liver having macrocytic anaemia with a megaloblastic bone marrow responded to large doses of vitamin B<sub>12</sub>. Folic acid, thymine and ascorbic acid were found to be helpful adjuvants in refractory cases. Folic acid alone cured the severe macrocytic, normochromic anaemia of rats showing a chronic folic acid deficiency.

A heat-labile haemolytic factor, resembling serum coagulation accelerator, was present in the plasma of patients with paroxysmal nocturnal haemoglobinuria as an inert precursor which could be activated by thrombin. The haemolysis was inhibited by dicumarol.

Cases of hereditary or familial nonspherocytic haemolytic anaemia were described associated with bradyphalangia and porphyria and transmitted as a Mendelian dominant. Haemolytic anaemia was noted in some patients who received antihistamine

drugs over a long period of time, in patients with severe second and third degree burns, in rats poisoned with sulfathiazole, in a patient with chronic myelogenous leukemia, and in two California children who had eaten fava beans. Erythrophagocytosis was noted in the blood of the newborn with haemolytic disease, but not in normal infants.

The relationship of sensitization of Rh negative women received much attention. Besides the development of erythroblastic infants who were Rh positive in mothers sensitized from the infant, examples of the development of antibodies were described after blood transfusion and subcutaneous haemotherapy. The occurrence of erythroblastosis in one of a set of twins was reported.

Erythroblastosis foetalis was treated by replacement transfusions, countersensitization with bacterial vaccines and with hapten (extract of Rh positive red blood cells). While results were sometimes encouraging in individual patients, the effects were, as a whole, poor. Erythroblastosis was prevented in some patients by treating the mother with vitamin K and anhydrohydroxy-progesterone. Good results were noted in one series of cases after the transfusion of 50 to 60 c.c. of sedimented red blood cells. The results of treatment with exchange transfusions varied in the hands of different workers, some reporting cures whereas others had a high death rate.

The concentration of anti-A and anti-B substances in the blood of group O (universal) donors was reduced to safe levels for use in treating anaemia by the addition of substances isolated from animal stomach linings. Otherwise severe haemolytic anaemia developed in some patients. Some reactions were prevented by using washed red blood cells instead of whole blood.

At high altitudes during an aeroplane trip sudden enlargement of the spleen, with heart complications, was noted in a patient with sicklaemia. Sickling was noted in the blood of people with sicklaemia and patients with sickle cell anaemia when the oxygen tension was reduced. Severe anaemia developed during the course of an aplastic crisis in patients with sickle cell anaemia associated with hyperhaemolysis. In a study of the incidence of sickling, it was found to be less frequent in pure Negroes than in those with small admixtures of white or Indian ancestry. Sicklaemia was more common in central and west Africans than in American Negroes, but the anaemia was more frequent in the latter group. Sickle cell anaemia was reported in a newborn Negro infant and in a white Sicilian family. Mediterranean anaemia was noted in a Chinese child.

Anaemia was noted in 14% of the people in middle Tennessee.

The earlier reports of British workers on the efficiency of intravenously administered saccharated iron oxide were confirmed by numerous observers. (See also VITAMINS.)

Dameshek, "Paroxysmal Nocturnal Hemoglobinuria. The Mechanism of Hemolysis and Its Relation to the Coagulation Mechanism," *Blood*, 5:822-842 (Sept. 1950); E. B. Brown, C. V. Moore, C. Reynafarje and D. E. Smith, "Intravenously Administered Saccharated Iron Oxide in the Treatment of Hypochromic Anemia: Therapeutic Results, Potential Dangers and Indications," *J.A.M.A.* 144:1084-89 (Nov. 25, 1950); B. H. Sullivan, "Danger of Airplane Flight to Persons with Sicklemia," *Ann. Int. Med.* 32:338-342 (Feb. 1950). (R. Is.)

**Anaesthesiology.** During the year 1950 it became apparent that certain specially prepared synthetic salts, such as methyl iodide and methyl chloride of curare, had no apparent advantages over the standard *d*-tubocurarine that had become almost a standard agent in a solution of 3 mg. per cubic centimetre. Curare possessed an advantage over decamethonium bromide, or C-10, with the trade name of Sincurine, in that an antidote for curare was available, whereas there was none for Sincurine. Previously, prostigmine had been fairly effective as an antidote for curare, but by the middle of 1950 an

agent, an analogue of prostigmine (Hoffmann-LaRoche, Inc.), was found to be very effective in increasing the volume of respiration when undesired depression had developed from the use of curare.

In the field of shock therapy dextran, gelatin and periston showed themselves to be valuable.

The number of physicians who entered the field of anaesthesiology increased considerably in 1950, and higher standards were set up and attained by them. The nurse-anaesthetists, through their national nurse-anaesthetist association, similarly made their examinations more difficult and raised their standards.

The subject of anaesthesiology received increased attention in those journals which present abstracts of articles on the subject. One of the notable additions was *Excerpta Medica*, surgery section, which presented anaesthesia abstracts. Another publication, *Anesthesia Abstracts*, was revised and improved.

The so-called pain clinics increased in number; each clinic showed an increase during the year in the number of patients handled. Refinement in technique was achieved, so that the use of roentgenograms which show that the needles have been properly placed had become almost essential in most instances of nerve block. Measurements of skin temperature and skin resistance to electric current proved to be very informing as to the effectiveness of blocks that were done and of subsequent operations in which nerves had been sectioned.

Albert Faulconer, Jr., invented a device which enabled the intermittent intravenous administration of solution of pentothal sodium to be automatically controlled by measuring the minute volume of respiration. The meter of the device became useful in the measurement of respiratory depression caused by curare and the effect of the various antidotes used to abate such depression. It was found to be useful in the postanesthesia observation room in helping to estimate the patient's condition as anaesthesia becomes light or disappears.

To improve conditions in operating rooms, the question of better safeguards against fire and explosion hazards was given much attention. One motion picture with sound and colour was

produced as a method of instructing all personnel who work in the operating room in the essentials of the problems of fire and explosion hazards. Because it had become clear that safety cannot be bought, it was recognized that safety must be achieved with the aid of all methods possible. Particularly important is the teaching of personnel who work as a team in the operating room. (See also ELECTRONICS; SURGERY.)

**Andorra.** A small autonomous principality between France and Spain, Andorra has an area of 191 sq.mi. Pop. (1950 est.): 5,400. Language: Catalan. Religion: Roman Catholic. Capital: Andorra-la-Vieja (pop., 1950 est., 980). Co-princes: the president of the French republic and the bishop of Urgel, Sp., respectively represented in 1950 by André Bertrand and Jaime Sansa Nequi, their *viguiers* or representatives. An elected general council of 24 members appoints one of its members as the *syndic général des vallées* (from 1946, Francisco Cayrat).

**History.**—The event of the year 1950 was the reduction from 100 to 60 of the French *gardes mobiles* which were stationed from autumn 1944 on Andorran territory for the purpose of maintaining order.

On Feb. 2 the Paris Tribunal des Conflits declared null and void the order of a Paris court given on March 8, 1949, to the Radiodiffusion Française to cease jamming the broadcasts of Radio Andorra. However, the Andorran broadcasts were not jammed during the year.

**Angling.** The popularity of fresh-water fishing in the United States continued its upward spiral during the fiscal year ending June 30, 1949, when the sales of anglers' licences climbed to a new high record of 15,478,570. The gross revenue derived by the 48 states from licence sales was \$32,657,940. Michigan headed the list with 1,110,109. California ranked second with 1,030,617, followed by Wisconsin with 1,022,004.

The 42nd annual national casting tournament was held at San Francisco, Calif., Aug. 16-20, 1950. Earl Osten took the all-distance championship with a score of 3,080 ft. The five-eighth-ounce distance bait event was won by Douglas Merrick with an average of 377½ ft. In the all-accuracy division, Marion Garber, a 21-year-old caster from Toledo, O., tied Osten's world record of 389 which he set in 1944 at St. Louis, Mo.

A seven-man squad of anglers from Chile, making their first bid for international tuna-fishing honours at Wedgeport, N.S., Sept. 14-16, won the Alton B. Sharp trophy in competition with six other teams from ten countries by the margin of 348 points. Forty-five anglers participated. The British team was second with 1,614 points, followed by Brazil with 640 points, Cuba with 563, Argentina with 393 and Scandinavia with 195; the seventh team, the United States, did not catch a fish. Tom Wheeler, of Toronto, Ont., fishing for the British commonwealth team, caught the biggest tuna of the tournament, 707 lb., in the closing minutes.

The International Game Fish association's outstanding world record catch for the year was a 977-lb. bluefin tuna, an all-tackle record, made by Duncan McIntyre Hodgson of Montreal, Que., at St. Ann bay, N.S., Sept. 4, 1950. The long-standing women's all-tackle record was beaten with an 846-lb. Pacific black marlin, caught in the Bay of Islands, N.Z., Feb. 14, 1950,

**SERVO-ANESTHETIZER** (right), an electronic device for maintaining a constant level of anaesthesia during surgery, developed by R. G. Bickford and associates at the Mayo clinic and exhibited for the first time in June 1950. By transmitting the patient's brain waves to the machine the injection of the anaesthetic agent was automatically controlled

FISHING THROUGH THE ICE on Lake Minnetonka, Minn., in a contest sponsored by the American Legion early in 1950. At 10° below zero, more than 700 anglers competed for the first prize which was taken by a catch of a one-pound, nine-ounce northern pike

by Mrs. A. V. Brownson of Auckland, N.Z. Herman Teetor made an all-tackle Atlantic sailfish record with a 123-lb. catch off Walker cay. On the Pacific, where the sails run larger, Gay Thomas of Santa Barbara, Calif., took the women's all-tackle and 50-lb. line test class records for both men and women with a 192-lb. catch made on Sept. 6 off La Paz, Mex.

Other world records taken in 1950 were: arctic charr, 11½ lb. (length 30 in., girth 17 in.), caught by John Durant in Richmond gulf, Hudson bay, on Aug. 10; and a 4-lb. 12-oz. bluegill (length 15 in., girth 18¼ in.) in Ketona lake, Ala., by J. C. Higgins on April 27. (A. J. ME.)

**Anglo-Egyptian Sudan.** A territory in northeast Africa, Anglo-Egyptian Sudan is under the joint sovereignty of Great Britain and Egypt. Area: 967,500 sq.mi. Pop. (1948 est.): 7,547,500. Languages: English, Arabic and various Nilotic and Negro tribal dialects in the south. Religion: Arabic minority is Moslem; the bulk of the Negro population is heathen; only c. 20% of population in the south is Christian. Chief towns (1948 est.): Khartoum (cap., 711,400); Omdurman (125,300); El Obeid (70,100); Wad Medani (57,300); Port Sudan (47,000). Governor general, Sir Robert George Howe; leader of the legislative assembly, Miralai Abdullah Bey Khalil.

**History.**—The differences between Great Britain and Egypt about the future of the Sudan remained unsolved during 1950 and were the subject of renewed political excitement in Egypt toward the end of the year. This dispute continued to have its effect upon the internal political life of the country, yet it could be said that the year was one of progress toward the government's declared object—the Sudanization and independence of the Sudan. In his report on local government, which had been called for in 1949, A. H. Marshall made proposals for drastic changes in policy, involving the creation of single local authorities for all purposes, financially independent, and answerable to the local electors. The executive council accepted the proposals in principle and laid them before the Sudan legislative assembly, which thereon approved what amounted to the replacement of the Egyptian (and originally French) system by an English one.

The ministers of health and agriculture announced five-year

plans, but the most notable developments were in the field of education. The minister, Abdurrahman Ali Taha, stated that his department planned to extend elementary education to cover two-fifths of the children of school age in the northern Sudan within a decade. This would involve the opening of new centres for the training of teachers and the increasing of the number of boys' elementary schools in the area from 156 to 356 and of girls' schools from 101 to 211. The third government secondary school, which opened at El Obeid in January with accommodation for 480 boarders, was under the charge of the first Sudanese headmaster in history.

A potentially serious source of Sudanese disunity was the difference between the Moslem, Arabic-speaking and advanced north and the more backward and still largely pagan Negro south. The considerable activities of Christian European missionaries in the south led to assertions that Islam and Arabic were being handicapped. The minister of education announced that 18 northern officials were to be sent to further the spread of Arabic in the south, while southern requests for English programs from the Omdurman radio station were not acceded to.

National feeling showed itself in debates on the Sudan defense force, although it was made clear that Sudanization had progressed so far that there were in 1950 only 40 British officers, as against 69 in 1939. On June 30 the Sudan Plantations syndicate was wound up, and the Gezira scheme came under nationalized control. This was the occasion of what must be regarded as the most striking feature of the events of the year, because when a British member of the executive council was appointed to its management, he was replaced by a Sudanese, thereby giving rise to a Sudanese majority (7 Sudanese as against 5 British members) on that body. The legislative assembly debated the future of Gezira and important reforms in land registration were undertaken. In December considerable excitement was caused by a debate on a motion in the legislative assembly in favour of the immediate independence of the country, which was defeated by one vote. (See also EGYPT.) (H. S. D.)

**Education.**—(1949) NORTHERN SYSTEM: government schools: elementary 249, pupils 35,613; subgrade and Koran 544, pupils 38,550; intermediate 17, pupils 2,568; secondary 5, pupils 1,045; technical 2, pupils 312; teachers' training colleges 5, teachers trained annually 245. Nongovernment schools 60, pupils 14,791. University education at Gordon Memorial college, higher education at Kitchener School of Medicine. SOUTHERN SYSTEM: schools: elementary 3, pupils 291; intermediate 1, pupils 150; secondary 2; pupils at mission schools 20,669.

**Finance and Banking.**—Budget (1949 actual): revenue £E18,700,000, expenditure £E11,600,000; (18 months 1950–51 est.) revenue £E28,700,000,

expenditure £E21,100,000. Total external debt (Dec. 1948) £E12,800,000, of which £E5,400,000 was to Egypt for development. Monetary unit: Egyptian pound valued at \$2.87 U.S. in Dec. 1950.

**Foreign Trade.**—(1949) Imports £E23,900,000; exports £E27,400,000. Main sources of imports (1949): U.K. 32%; Egypt 16%. Main destinations of exports U.K. 65%; Egypt 10%. Main imports: cotton piece goods 18%; sugar, coffee and tea 14%; coal, oil fuel and gasoline 0.5%. Main exports: raw cotton 69%; livestock 10%; gum 0.6%.

**Transport and Communications.**—Railways (1949): 2,013 mi. Licensed motor vehicles (Dec. 1949): cars 2,600; commercial 3,300. Telephone subscribers (1949): 3,520. Wireless licences (1949): 3,227.

**Agriculture.**—Main crops (metric tons, 1949): cottonseed 110,000; cotton, ginned 55,000; sesame seed (1947) 141,200; gum arabic (1947) 37,000; peanuts (1947) 20,000; dates (1947) 46,000. Livestock (Jan. 1948): cattle 3,500,000; sheep 5,500,000; camels 1,500,000.

**Antarctica.** The antarctic continent lies almost entirely within and is circumscribed by the Antarctic circle. With an area of nearly 6,000,000 sq.mi., equal to the United States and Europe combined, nine-tenths of it is covered by an ice sheet, thousands of feet thick in places. The 2,000,000 sq.mi. area thus far seen by man has an estimated elevation of about 5,000 ft., with the south pole at a height of slightly less than 10,000 ft. The 14,000-mi. coast is largely inaccessible to ship navigation because of sea ice barricading the coastal shores.

The 1950 season was an active one. The men at the British base on Stonington Island, Marguerite bay, who had involuntarily remained a third winter because of impenetrable ice conditions, were relieved by aeroplane in March. A few days after the rescue, however, the ice floes opened up and the rescue ship managed to sail to their base. This base as well as the one at Hope bay on the northern end of the Palmer peninsula were abandoned, leaving five British bases still in operation.

The French expedition headed by Andre Liotard also encountered more favourable ice conditions during the year. Aided by air reconnaissance, their ship, "Commandant Charcot," was able to reach the mainland after a long search for sea leads through the

**CAMP IN THE ANTARCTIC** where 14 Australian scientists and explorers conducted weather research in 1950; their camp was at Atlas cove on Heard Island, 1,400 mi. southwest of Australia

40-mi. stretch of pack ice which had previously blocked their passage south. They anchored off the coast of Adélie Land during the middle of Jan. 1950. The 11 researchers composing the wintering party settled at Cap de Margerie for a study of the virtually uncharted French sector south of Australia until spring 1952. In France, Paul-Émile Victor was in charge of the entire project which also included scientific studies in the arctic regions with a station established in the centre of the Greenland ice cap.

The Norwegian-British-Swedish expedition to Queen Maud Land reached the coast with the aid of aerial reconnaissance in the first week of Feb. 1950. Their wintering base, Maudheim, in honour of former Queen Maud of Norway, was established on Norvegia cape where the first landing was made. In addition to the Norwegian leader, John Gjaever, there were six Norwegians, four Swedes, two Englishmen, an Australian and a South African in the wintering party. The expedition was scheduled to remain on the continent conducting investigations in many branches of science until the early part of 1952. This international scientific project, under the direction of Harald U. Sverdrup, head of the Norwegian Polar institute in Oslo, Nor., receives 75% of its support from Norway. Sverdrup was to embark for the antarctic on the expedition ship "Norsel," a Norwegian sealer, which would transport planes for aerial surveying during the antarctic summer of 1950-51.

On Heard and Macquarie Islands, south of Australia, the Australian government was operating permanent meteorological outposts. Their personnel was replaced every year.

In June the soviet government announced plans for a whaling and exploring expedition to the antarctic. Four earlier soviet postwar whaling expeditions had included a number of scientists. It was not known, however, whether the Russians had established bases on the continent, or to what extent their scientific work was progressing.

(F. RE.)

**Anthropology.** The 50 years 1900 to 1950 witnessed a remarkable growth in anthropology. A survey by Erminie W. Voegelin published in the *American Anthropologist* showed that during this period the number of institutions offering anthropology courses in the United States and Canada had grown from 11 to 304, while the teaching staffs, originally numbering 17, increased to 604. This growth continued without abatement in 1950, and was accompanied by increased opportunities for field research throughout the world. The British government's plans for colonial development included arrangements under the Fulbright program for establishing research and teaching fellowships in the British colonies. The East African Institute of Social Research was established at Makerere university, Uganda, under

the direction of Audrey I. Richards for the purpose of conducting anthropological, linguistic, economic and psychological studies in Kenya, Uganda, Tanganyika and Zanzibar.

In the United States, foreign area studies received further support from the Carnegie Corporation of New York which allotted additional funds to the Social Science Research council for area training fellowships. A number of American universities expanded and improved their research facilities for area studies. Yale, Harvard and the Universities of Iowa, North Carolina, Oklahoma and Washington joined as participating members in an organization known as the Human Relations Area Files, formerly the Cross-Cultural survey, established by George P. Murdock at Yale.

An important contribution to area research was Julian H. Steward's *Area Research: Theory and Practice*, published by the Social Science Research council. The University of California at Los Angeles, represented by Joseph B. Birdsall, collaborated with the Commonwealth Serum Laboratory of Victoria, Australia, represented by Roy T. Simmons, in inaugurating a long-term genetical survey of the human populations of the Pacific area.

Problems of common interest to anthropology and genetics were discussed at a symposium on the Origin and Evolution of Man, held at the Biological laboratory, Cold Spring Harbor, N.Y. In *Genetics and the Races of Man*, William C. Boyd presented the first comprehensive statement of the role of genetics, and particularly the blood groups, in the variation and racial classification of man. According to Boyd, a race should be defined as a population that differs significantly from others in the frequency of one or more of its genes rather than in the possession of a certain combination of phenotypic or external bodily characters. It was pointed out by Chandler W. Rowe ("Genetics vs. Physical Anthropology in Determining Racial Types," *Southwestern Journal of Anthropology*) that the genetical classification, no less than the anthropological, had its limitations and that the objectives of the two systems were not identical. A striking example of the importance of blood group studies for tracing population movements and relationships was an article in the *American Journal of Physical Anthropology*, "The ABO, MN, and Rh Blood Groups of the Basque People," by J. N. Marshall Chambers, Elizabeth W. Ikin and A. E. Mourant. A comparison of the blood group gene frequencies of the Basques with those of other Europeans led the authors to the conclusion that the present population of western and central Europe arose from the mixing of people akin to the Basques with later invaders from Asia.

In *Races; A Study of the Problems of Race Formation in Man*, Carleton S. Coon, Stanley M. Garn and Joseph B. Birdsall emphasized the importance of environmental conditions in the development of phenotypic features characteristic of the various races. Ashley Montagu's *On Being Human* was a forthright attempt to marshal the evidence of science in the interest of human understanding and progress. In this remarkable volume he assumed the task of proving from the data of biology, psychology and anthropology that co-operation, not conflict, was a basic law of life.

The year 1950 brought new proof of the effectiveness of two recently discovered techniques for dating ancient skeletal and cultural materials—the fluorine and carbon-14 methods. The fluorine-dating method, described by Kenneth P. Oakley and C. Randall Hoskins in *Nature* ("New Evidence on the Antiquity of Man"), gave a decisive answer to the long-disputed question of the age and faunal associations of *Eoanthropus*. Analysis of the fluorine content in these hominid and other mammalian fossils from the Piltdown gravel showed that all of the *Eoanthropus* specimens—teeth, skull and jaw fragments—were contemporaneous, and that they belonged to the upper or middle instead of lower Pleistocene, as formerly supposed. On the other hand the

BURIED HEARTHS uncovered in the Tiber Reservoir area, Mont., by fieldworkers of the River Basin surveys of the federal government in 1950. Results of the expedition threw considerable light on the sequence of cultures in that portion of the Missouri basin

fluorine test confirmed the antiquity of the Swanscombe skull. The method of dating organic materials by means of radioactive carbon, which was developed during the past several years by W. F. Libby and J. R. Arnold of The University of Chicago Institute for Nuclear Studies, yielded fruitful results in 1950, when the first carbon-14 dates were officially announced. Of particular significance for American anthropology was the dating of the last glaciation as about 12,000 years ago, and the demonstration that man was living in western North America at least as early as 8000 B.C. and at the southern tip of South America some 2,000 years later.

The South African *Australopithecinae* continued to be a subject of discussion in 1950. The eight skulls and other fossil remains of this group discovered in 1947 by Robert Broom were described by Broom, J. T. Robinson and G. W. H. Schepers in a *Memoir* of the Transvaal museum: part 1, "Further Evidence of the Structure of the Sterkfontein Ape-Man *Pleisanthropus*"; part 2, "The Brain Casts of the Recently Discovered *Pleisanthropus* Skulls." Broom restated his views on the significance of the *Australopithecinae* in the evolution of man in another book, *Finding the Missing Link*. S. Zuckerman, in *Nature*, contended that the dimensions and indices of the *Australopithecinae* teeth did not differ significantly from those of anthropoid apes. W. E. le Gros Clark, in the same journal, maintained that Broom's new evidence left no doubt of the hominid status of the *Australopithecinae* population, which exhibited a combination of manlike features in skull, palate, teeth and pelvis observed in no anthropoid ape.

New anthropological journals included *L'Homme: cahiers d'ethnologie, de géographie et de linguistique*, issued by the École Pratique des Hautes Études of the Sorbonne and edited by Claude Lévi-Strauss, Emile Benveniste and Pierre Gourou; and *Homo, Zeitschrift für die vergleichende Forschung am Menschen*, under the editorship of E. Freiherr von Eickstedt. The latter journal, which was to appear quarterly, would continue the tradi-

tion and international character of the earlier *Zeitschrift für Rassenkunde*.

Columbia university inaugurated a program for the study of contemporary cultures in the middle and far east, beginning with a field project in India under the direction of Mrs. Gitel P. Steed and Morris Carstairs.

Studies of the Chinese and Japanese segments of the population in Hawaii were made by Francis L. K. Hsu and Marvin K. Opler, respectively. Henry Field completed measurements of more than 2,000 individuals of different tribes in Iraq and Iran. Carleton S. Coon conducted archaeological and somatological work in Iran and Allan H. Smith and Ann G. Smith made ethnographic studies in the Ryukyus.

Philip Drucker completed an ethnographic survey of the Marshall Islands for the U.S. naval administration. Other American anthropologists who engaged in field work in Micronesia under auspices either of the navy or the Pacific Science board were Gordon MacGregor, John L. Fisher, Thomas Gladwin, Ann Meredith and C. H. Hendricks.

A number of field investigations were conducted in the American arctic. L. L. Hammerick, professor of Germanic philology at the University of Copenhagen, made linguistic studies on Nunivak Island, Alaska. William S. Laughlin and Frederica de Laguna continued their research programs in the Aleutian Islands and in the Tlingit area of southeast Alaska, respectively. Viola Garfield collected data on northwest coast Indian art and Douglas Leechman worked among the Athabascan Indians in the interior. J. L. Giddings, Jr. and Helge Larsen, joined by F. G. Rainey, continued their investigation of pre-Eskimo remains on Seward peninsula and the Bering sea coast. On Cornwallis Island in the Canadian arctic, H. B. Collins and W. E. Taylor found evidence of three periods of occupation—Dorset, early Thule and late Thule.

Other anthropological investigations in the north were those of Demetri B. Shimkin and Wendell H. Oswalt in Alaska, A. C. Spaulding in the Aleutian Islands, Elmer Harp in Newfoundland and Edmund S. Carpenter on Southampton Island.

Isaac Schapera was appointed professor of anthropology at the London School of Economics and Political Science, and Meyer Fortes succeeded J. H. Hutton as professor of social anthropology at Oxford.

Gordon R. Willey was appointed Bowditch professor of Mexican and Central American archaeology and ethnology at Harvard, and Alfred Metraux became head of the United Nations Educational, Scientific and Cultural organization's division for the study of race relations.

The Viking fund medalists for 1950 were George P. Murdock, general anthropology, William K. Gregory, physical anthropology and Hallam L. Movius, archaeology.

A second edition of the *International Directory of Anthropologists*, edited by Melville J. Herskovits, was issued by the Committee on International Relations in Anthropology of the National Research Council. Important publications that appeared during the year included volume 6 of the Bureau of American Ethnology's *Handbook of South American Indians*, edited by Julian H. Steward; *Man in the Primitive World: An Introduction to Anthropology*, by E. Adamson Hoebel; *An Introduction to Social Anthropology*, by Ralph Piddington; *Anthropology, the Science of Human Society and Culture*, by J. S. Slotkin; *Social Organization of the Western Pueblos*, by Fred Eggan; *Navaho Religion*, by Gladys Reichard; *Mandan Social and Ceremonial Organization*, by Alfred W. Bowers; *Art of the Northwest Coast Indians*, by Robert B. Inverarity; and *This Is Race: An Anthology Selected from the International Literature on the Races of Mankind*, by Earl W. Count. **Aqueducts.** The world's largest system of aqueducts, canals, dams and storage reservoirs is provided by the program of the United States bureau of reclamation for multipurpose use of the water resources in the river basins of 17 western states. The man-made waterways in the bureau's program include thousands of miles of canals and ditches, tunnels, siphons and pipe lines, and the largest and highest concrete dams on earth.

Hydroelectric power-generating plants on bureau projects, including the world's largest single-plant kilowatt capacity hydroelectric installations at Grand Coulee and Hoover dams, furnished in 1950 more than 19,000,000,000 kw.hr. of energy for farms, homes and industry.

Nearly 5,000,000 persons lived in areas served by the bureau's system of waterways; more than 92,000 farms were on the projects and about 380 towns were situated in or near those areas. Crops valued at \$516,329,000 were produced in 1949 on the 4,820,589 ac. of irrigated lands receiving federal reclamation water. On June 30, 1950, the bureau had in operation, under construction or authorized 81 irrigation and multipurpose water conservation projects.

During 1950 scientific studies of river-carried sediment deposits established the fact that Hoover dam and the 32,359,000 ac.ft. capacity reservoir which it created have a useful life of at least 275 yr. regardless of upstream control of sediment. This research set at rest fears that the usefulness of this reclamation reservoir and dam would be destroyed prematurely by the sediment deposits.

The program of the bureau of reclamation, which in 1950 reached an all-time record of \$275,000,000 worth of construction work, included a number of major aqueduct systems.

The Colorado-Big Thompson project in Colorado was famous for its 13-mi. Alva B. Adams tunnel, the longest irrigation tunnel in the world, transferring Colorado river water from the west to the east slope of the Rocky mountains through the continental divide.

The All-American canal in California was the largest irrigation canal in operation in the United States, being 232 ft. wide at the water surface, 160 ft. wide at the bottom and 20.6 ft. in depth with an initial capacity of 15,155 cu.ft. of water per second. The project included the 125-mi. Coachella canal which branches from the 80-mi. All-American main canal near the Mexican border about 20 mi. west of Yuma, Ariz., and terminates near Indio, Calif.

On the Columbia Basin project in central Washington, the bureau of reclamation had under construction during 1950 several large canals. The 1.6-mi. Feeder canal, when completed, would have a capacity of 16,000 cu.ft. per second, making it the largest irrigation canal in the United States. Columbia river water stored in Lake Roosevelt behind Grand Coulee dam would be lifted 280 to 360 ft. by giant pumps and discharged into the Feeder canal which leads to a 27-mi.-long reservoir. From there, the water would flow by gravity through siphons, tunnels, an artificial lake and the main canal to be used for the irrigation of about 1,000,000 ac. of land beginning about 40 mi. south of Grand Coulee dam. Other canals under construction on this project

included the 88-mi. West canal and the 130-mi. East Low canal which would branch from the main canal.

The most comprehensive multipurpose water conservation program undertaken in the United States, the Central Valley project, California, extends 500 mi. through central California. It consists of a network of canals, including the 153-mi. Friant-Kern canal and the 120-mi. Delta-Mendota canal, the former delivering San Joaquin river water from Millerton lake behind Friant dam to areas as far south as Bakersfield, Calif., and the latter transferring Sacramento river water from the San Francisco bay area southward 120 mi., discharging it into the Mendota pool in the San Joaquin basin at Mendota, Calif., thereby providing irrigation water to replace that diverted by the Friant-Kern canal. (See also CANALS AND INLAND WATERWAYS; DAMS; IRRIGATION; TUNNELS.) (M. W. Ss.)

**Arabia.** A peninsula of southwestern Asia of approximately 1,027,300 sq.mi., with a total population estimated at 9,513,000, Arabia consists politically of two independent Arab states, Saudi Arabia and Yemen (*q.v.*), the independent sultanates of Oman and Masqat or Muscat; the autonomous sheikhdoms of Bahrein, Kuwait, Qatar, and the Trucial sheikhdoms; and Aden colony and protectorates (*q.v.*). Language: Arabic. Religion: overwhelmingly Moslem (Sunni).

**Saudi Arabia.**—Area: *c.* 597,000 sq.mi. (excluding the Rub' al-Khali desert covering approximately 193,000 sq.mi.) Pop. (1949 est.): 6,000,000. Chief towns: Riyadh (cap. 60,000); Mecca (150,000); Medina (45,000); Jeddah (40,000); Hufuf (31,500). Ruler, King 'Abd-al-'Aziz Ibn-'Abd-al-Rahman Ibn-Faisal Ibn-

ARABIAN HERDSMEN watering their camels, sheep and goats at a well originally intended to supply water for wildcat drilling operations by the Arabian American Oil company. After the wildcat well was completed, the well was given to King Ibn-Sa'ud for the use of Bedouin tribesmen at Al Jauf

Sa'ud; viceroy of Nejd and commander in chief, Amir Sa'ud, crown prince; viceroy of Hejaz and minister of foreign affairs, Amir Faisal.

**History.**—During 1950 King Ibn-Sa'ud celebrated the jubilee of his rule. During his reign he had expanded his territories from his original kingdom of Nejd so that his government extended over nine-tenths of the whole of the Arabian peninsula.

In the Arab league Saudi Arabia tended, in association with Egypt, Syria and the Lebanon, to oppose the expansionist policy of King Abdullah of Jordan. Saudi Arabia made a loan of \$6,000,000 to Syria in Feb. 1950, in return for which Syria undertook to supply Syrian goods for Saudi-Arabian consumption (*see* SYRIA). The dollars were presumed to have come from U.S. oil royalties.

In August Saudi Arabia contracted a \$15,000,000 loan from the Export-Import Bank of Washington. An immediate payment of \$4,000,000 was to be devoted to the construction of airports, roads and seaports. The remainder was to be applied for the development of agriculture and for the improvement of health, sanitation and transport conditions.

The report published in July of the Arabian American Oil company (Aramco), whose active concessions were in the Saudi-Arabian province of El Hasa on the Persian gulf, announced the progress of the railway which was being constructed westward from the oil fields by way of Kharj and Hufuf to Riyadh. The line was expected to be open early in 1951.

Another development from the oil fields during 1950 was the practical completion of the desert pipe line to pump the Aramco oil westward across the desert through Saudi Arabia, Jordan, Syria and the Lebanon to the Mediterranean port of Sidon, south of Beirut. The company was negotiating "passage rights" with the governments concerned and it was hoped that oil would be flowing early in 1951.

Developments elsewhere in Saudi Arabia included the building of a new deep-water jetty and customs sheds at Jeddah, the Red sea port of Mecca, which would greatly improve the conditions of pilgrim traffic arriving by sea from Africa, India and the far east. A new all-weather highway was also being constructed from Jeddah inland to Medina. (O. M. T.)

**Education.**—Schools (1949): primary 30, secondary 5; preuniversity 1.

**Finance.**—Pilgrimage dues (1948 est., £10,000,000) and oil royalties (1948 est., more than £20,000,000) are the main sources of revenue. Monetary unit: rial, nominally equal to the Indian rupee, valued in 1950 at 21 cents U.S.

**Transport and Communications.**—Licensed motor vehicles (Dec. 1949): cars 6,000, commercial vehicles 7,700. Radio receiving sets (1949) 9,000.

**Industry.**—Crude oil production (1949): 23,460,000 metric tons. Raw materials: copper (1948) 67 metric tons; gold (1949) 67,200 troy ounces; silver (1948) 67,819 troy ounces.

**Oman and Masqat.**—Area: *c.* 65,000 sq.mi. Pop. (1949 est.): 830,000. Ruler (from 1932): Sultan Said bin Taimur, the 13th of his dynasty.

**Bahrein.**—Area: 213 sq.mi. Pop. (1949 est.): 110,000. Ruler (from 1942): Sheikh Sir Sulman ibn Hamad al Khalifah.

**Kuwait.**—Area: *c.* 9,000 sq.mi. Pop. (1949 est.): 120,000. Ruler: Sheikh Abdullah bin Salim al-Subah, who succeeded his uncle, Sheikh Sir Ahmed ibn Jabir al Subah after the latter died on Jan. 29, 1950.

**Qatar.**—Area: *c.* 4,000 sq.mi. Pop. (1949 est.): 16,000. Ruler (from 1949): Sheikh Abdullah ibn Jasim al Thani.

**Trucial Sheikhdoms.**—Area: *c.* 16,000 sq.mi. (including the sheikhdoms of Shargah, Ras al Khaimah, Umm al Qawain, Ajman, Debai, Abu Dhabi and Kalba). Pop. (1949 est.): 105,000.

**Arab League:** *see* ARABIA; EGYPT; IRAQ; JORDAN; LEBANON; MIDDLE EASTERN UNITY; SYRIA.

**Archaeology.** Eastern Hemisphere.—Probably the most significant event for archaeology generally (as

BRICK-BUILT CENTRAL GRANARY, the best preserved building of the 4,000-yr.-old Indus valley civilization at Mohenjo-Daro, Pak., discovered by the Archaeological department of Pakistan which was in its third year of activity in 1950. Note the main loading platform in the foreground

well as for old world archaeology in particular), in the year 1950, was the announcement of the results of the first 18 months of experimentation with the radiocarbon technique of establishing dates for pre- and protohistoric materials. This technique had been under development by W. F. Libby of the Institute for Nuclear Studies of The University of Chicago, in collaboration with his colleagues there (especially J. R. Arnold), and with a committee appointed by the American Anthropological association and the Geological Society of America. While still in its developmental stage, the technique gave great promise of becoming a reliable means of arriving at fairly precise dates for specimens of archaeological interest back to about 20,000 or more years ago. The specimens tested were of organic materials, and the method was one of discovering the residual amounts of the radioactive isotope carbon 14 in specimens of an organic material (*i.e.*, charcoal or other vegetable material, burned bone, teeth, shell, etc.). Libby had established the time rate of the decline and disappearance of the radioactive isotope, and was able to assign a date relative to the residual amount of radioactivity which any given specimen might still contain.

Of the results announced in Sept. 1950, 11 tests were reported on specimens from the near east and 20 specimens from Europe. Several of the specimens tested from the near east were of known historical date, and were done as "check runs." Of the specimens of unknown date, two from Egypt and one from Iraq were very significant. A slab of wood beam from the tomb of the vizier Hemaka, contemporary with the pharaoh Udimu of the 1st Egyptian dynasty, yielded a date of  $2933 \pm 200$  years B.C., which checked remarkably well with the reckonings of the historical chronologists for the date of the first Egyptian dynasty. Wheat and barley from a pit of the Fayum A Neolithic site in Egypt—

material often suspected to be the oldest village-stage material in Egypt—yielded a date of  $4145 \pm 250$  years B.C., which was about 1,000 years less than the current archaeological "guess-dates." Snail shells from the site of Jarmo in Iraqi Kurdistan, the earliest village-stage material yet recovered in detail from western Asia, yielded a date of  $4857 \pm 320$  years B.C., slightly over 1,000 years later than the excavator's estimate.

For Europe, the test yielded a date of about  $14000 \pm 900$  years B.C. for charcoal from the Lascaux cave in France, where a remarkably fine series of cave paintings were discovered in 1940. This date indicated only about half the antiquity which had been suspected for Lascaux. On the other hand, a test of wood from the Mesolithic site at Starr Carr, Yorks., Eng., reported in 1949, gave a date of  $7538 \pm 350$  years B.C., which was somewhat older than had been assessed by the excavator. Not all of the European results gave satisfactory checks with dates arrived at by pollen analysis, but there were certain other cases of surprising consistency between the dates arrived at by the two methods.

Further refinements in both laboratory techniques and in the methods of securing reliable samples were under development, and there was a general feeling that the radioactive carbon method of dating might prove to be one of the most useful research tools yet developed for archaeology.

Another important event for old world archaeology in the year 1950 was the convening of the International Congress of Prehistoric and Protohistoric Sciences at Zürich, Switz., in August. This first fully international gathering of archaeological scholars since before World War II was attended by more than 200 representatives from the countries of western Europe, the near east, and the Americas. A total of 104 papers were read in the sections, which were divided as to general subjects, the Palaeolithic, Neolithic, Bronze Age, Iron Age, and Age of Migrations. When publication of the proceedings of this congress was completed, the papers would stand as a convenient summary statement of the

general status of old world archaeology as of the period through World War II, and also as of what was approximately the first 100 years of archaeology as a recognized science.

*Pleistocene Prehistory.*—Digging activity in the Pleistocene and immediately post-Pleistocene levels in Europe and Africa was not so marked as in 1949, insofar as results had been reported by the close of the year. D. Garrod and John Waechter of Cambridge university worked in caves in France and Gibraltar. The above mentioned congress interrupted normal summer digging campaigns in Europe.

*The Near-Middle East.*—A considerable amount of work was done in Egypt, mainly in the category of architectural clearances and of the copying of tomb and temple scenes and texts. The staffs of the Egyptian Service des Antiquités and of the Institut Français d'Archéologie at Cairo were especially active in this work, and the Oriental Institute of the University of Chicago continued its program at Luxor. The beginning of an avenue of sphinxes leading from Luxor to Karnak was found, considerable clearance was made in the great temple at Karnak, and tombs in the Theban necropolis were worked. In April, a white quartzite sarcophagus of Takhout, wife of the pharaoh Psammetichus II, was accidentally discovered at Tell Atrib. There was a rich funerary accompaniment, but the queen's body was decomposed.

P. L. Shinnie, director of the Sudan Antiquities service, continued work at Amara West, completing the excavation of the 19th-dynasty Egyptian governor's palace at that site. A. J. Arkell elaborated his earlier finds in the Neolithic of the Sudan by excavations at Sheheinab, a site characterized by "gouged" decorated pottery.

In Israel, there was flourishing archaeological activity, many finds having been made accidentally by contractors while putting in foundations for buildings and public works. Such discoveries were controlled by the Israeli department of antiquities staff, and by an industrious public organization called the Friends of Antiquities. Under such circumstances, a variety of clearances were made in the Jerusalem, Tel Aviv and Jaffa regions especially pertaining to almost all ranges of ancient times. A clear Ghassulian type settlement was identified on the outskirts of Tel Aviv, and Neolithic, Early Bronze and Hyksos materials were reclaimed near its harbour. The department of antiquities also carried on large-scale excavations at Khirbet Kerak, concentrating on the clearance of a large quadrangle of Roman date, which yielded mosaics whose motifs indicate a Jewish origin. M. Stekelis carried on excavations at an important Neolithic workshop southeast of Lake Tiberias. Père R. de Vaux of the Dominican École Biblique et Archéologique cleared a grotto with Greek inscriptions near Bethany, and resumed his important work at Tell al Farah.

In Hashimite Jordan, an interesting co-operative venture was carried on by the American Schools of Oriental Research under J. C. Kelso, in which the United Nations refugee organization put Arab refugee workmen and also equipment at the disposal of the excavators. A large-scale clearance in an Islamic pleasure palace near Jericho was made.

M. M. Dunand continued his work at Byblos, in Lebanon, working mainly in the Aëneolithic cemetery, where two especially fine tombs with gold, silver and carnelian jewellery were recovered. Architectural clearances and restorations were carried on at Tyre and in the great temple compound at Baalbek. In Syria, the department of antiquities spent most of its efforts on the completion of the magnificent restoration of Kasr el Heir in the Damascus museum, but Claude Schaeffer continued his important excavations at Ras Shamra with work in the palace area. Schaeffer also carried on work at the site of Enkomi in Cyprus, which he identified as the town of Alasia, and which yielded rich sub-Mycenean materials.

Reports of the results of the autumn, 1949, campaign at Kanesh-Kultepe in Turkey became available. There Tahsin Özgüç continued the very important work of the Turkish Historical society, in the quarter where the Assyrian merchant colonist lived in this Anatolian city. The site continued to yield remarkably rich artifacts and inscriptional material; the pottery and small objects would give real substance to the comparative archaeology of Anatolia for a long range. H. T. Bossert continued his work at Karatepe and Demuztepe and carried on a survey in the region south of Adana. Sir Leonard Woolley finished his work at Tell Atchana and on other sites in the region of Antioch, and M. Louis Robert did clearance in the temple area at Amyzon. The British School of Archaeology in Ankara carried on several small test excavations, and also collaborated with the British school at Athens and the Ankara university in the continued excavations near Izmir, where a range back to the time of Troy I had been reached.

In Iraq, the Oriental Institute resumed excavations at Jarmo in the Kurdish hills above Kirkuk, where the earliest substantial exposure in the beginning village-stage of western Asia was being investigated (*see above*). A joint University museum (University of Pennsylvania)-Oriental Institute (University of Chicago) expedition, under D. E. McCown, continued at Nippur, making clearances in the area of the temple of the god Enlil, and on the tablet hill where levels ranging from the 3rd Ur dynasty to Achaemenid times were investigated. These later operations yielded about 750 cuneiform tablets and a rich variety of artifacts, all of considerable historical importance. Max Mallowan of the British School of Archaeology in Iraq made exposures in the Assyrian levels of Nimrud, which yielded spectacular carved ivory. In Iran, M. R. Ghirshman carried on the French excavations at the site of Susa; Islamic-Sassanian levels were concentrated upon, but some earlier materials were also recovered. Research proceeded on the important materials recovered from four caves in Iran, by C. S. Coon of the University of Pennsylvania.

In Afghanistan, M. Daniel Schlumberger, for the French delegation, cleared the audience hall of the great Ghaznavid palace at Laskari Bazar, and uncovered a series of paintings of rows of men, rendered in a somewhat Buddhistic fashion. R. E. Mortimer Wheeler, archaeological advisor to the Pakistan government, did a large-scale clearance at the Indus city of Mohenjo-Daro. The massive mud brick substructure of a great public granary was uncovered, defensive bastions preserved to a height of ten feet were investigated, and a test cut done with the aid of a pump, plumbed to ten feet below the present water table without reaching virgin soil.

W. F. Albright was the head of an expedition to south Arabia, which accomplished a variety of cartographic and epigraphic tasks, and fixed the range of duration of the Qatabanian kingdom to about 500–50 B.C., by excavations at Timma.

*Classical Lands.*—The American School of Classical Studies continued the excavation of the Athenian Agora, and the detailed study of the buildings surrounding it. Pieces of sculpture found on the slope of the temple hill of the so-called Theseion (now identified as a temple of Hephaestus) were shown to have come from the east pediment of the building, and the general theme of the composition was established. Considerable attention was given to the Stoa of Attalus, which was to be entirely reconstructed and would serve as a museum for the finds from the Agora. Oscar Broneer directed the school's excavations at Corinth, where buildings of the amusement quarter were examined. The French school continued its work at Delphi, and the British school carried on research in Crete as well as in Greece and on the Turkish coast at Izmir (*see above*). A University museum, University of Pennsylvania, expedition began a large-scale cam-

paign at Gordium, in Turkey.

In Italy, J. S. P. Bradford of the Pitt Rivers museum, Oxford, reported on a successful aerial survey, locating unknown sites and elaborating knowledge of known sites, which had been done with the aid of the royal air force at the end of the war. The *American Journal of Archaeology* section on the classical lands contained many details on the work of the various national schools of archaeology in Rome. Archaeologists were reported to have satisfied the Vatican authorities with the identification of a tomb found in the substructure of St. Peter's basilica as that of St. Peter.

**Far East.**—With the troubled conditions prevailing in further Asia, there was little archaeological activity to account for, save for investigations by the state archaeological services in India, which included work on dolmens and other megalithic structures in Hyderabad, and on sites dating from the reign of Asoka in Orissa. (See also ANTHROPOLOGY.)

(R. J. B.)

**Western Hemisphere.**—The Viking fund medal for archaeology in 1949 was awarded to H. L. Movius and the A. L. Kidder medal was presented to Alfred M. Tozzer.

**Early Man.**—The problems of early cultures in the new world, particularly in North America, received considerable attention in 1950. In general it may be said that the apparent gap between the chronologies of the later Indian cultures which could be connected with the historic period and early remains such as Folsom and Yuma was being closed. Not only were additional discoveries made but also estimated dates were undergoing revision. New dating techniques indicated that archaeologists had been too conservative in estimating recent chronologies, while geologists had over-estimated the age of late Pleistocene phenomena.

From the Rio de La Pasi6n in Guatemala, Barnum Brown reported the discovery of a fragment of fossil bone, possibly sloth, which has three V-shaped cuts that appear to have been made in fresh bone by man. This specimen was associated with other Upper Pleistocene faunal remains and gave the first direct suggestion of very early occupation of Guatemala.

George F. Carter continued work at La Jolla, Calif., on problems of terraces, valley fill, soils, sea level and their relations to evidences of human occupation. One grinding stone, a core tool and two flint flakes found beneath the soils of the Scripps cliff are from formations that suggest that they were deposited during a period of high sea level. Carter stated that if his deductions were correct this might be evidence of the presence of man in interglacial times.

In Utah Jesse D. Jennings, chairman of the department of anthropology, University of Utah, continued the excavation of Danger cave. The cave lies below the Stansbury terrace of Lake Bonneville and thus was not exposed for habitation until water had receded below this level after the onset of the Altithermal, about 6,000 years ago. The ten feet of cultural deposit lie directly on the beach gravel which forms the floor of the cave and appear to represent a long series of intermittent occupations. Several thin milling stones with pecked surfaces are suggestive of the early Cochise culture of Arizona. These were found at the base of the deposit.

Frank Hibben of the University of New Mexico reported the discovery of crudely chipped flint implements, a milling stone and evidences of fire on the surface of what seemed to be an old terrace of the Rio Grande south of Albuquerque, N.M. Above these remains lie 24 ft. of gravel which contain a considerable quantity of Pleistocene faunal material, especially mammoth bones.

Near Port Arthur, Ont., Richard MacNeish of the National Museum of Canada discovered a site which offered additional information on Palaeo-Indian culture. Plainview type projectile points, large crude choppers, and a variety of flint scrapers, some very delicately chipped, were found in an old beach deposit that at present is 235 ft. above the level of Lake Superior.

**Arctic Area.**—J. L. Giddings of the University of Alaska continued work at the remarkable early site at Iyatayet on Cape Denbigh in Norton sound. This was a continuation of the work begun in 1949. Additional artifacts from the sealed basal layer of the deposit further demonstrated the relationship of this microlithic complex to the Folsom and Yuma cultures of western North America and to the Mesolithic of northern Europe and Asia.

This site was extremely important in that it gave the first clear evidence relating early cultures of the old and new worlds.

Helge Larsen excavated, with excellent results, a large house of Ipiutak age located on the edge of the Deering air strip. Quantities of artifacts well preserved by the frozen ground added to knowledge of this culture. The cave in the Trail creek region of Seward peninsula discovered in 1949 was completely excavated and 11 additional caves were found, one of which

SUMERIAN FIGURE of a household divinity, dating from 1800 B.C., found at Nippur, Iraq, during a joint archaeological expedition from the Universities of Chicago and Pennsylvania. The seated figure was painted red except for the beard which was black

proved to contain cultural material. In the surface layers Eskimo artifacts were found but beneath these, separated by a layer of accumulated rock dust was discovered a complex of flint artifacts very similar to that found by Giddings at Iyatayet in Norton sound.

Wendell Oswalt, Walter Arron and their wives made a reconnaissance of the Yukon river and of the Bering sea coast between the mouth of the Yukon and Hazen bay. The expedition led by William Laughlin of Harvard university continued anthropological fieldwork in the Aleutians. Laughlin and James Leach of the University of Oregon made archaeological excavations on Adak and other islands as well as anthropometrical studies of the modern Aleuts.

John Marsh and Knut Bergsland, the latter from Denmark, carried on linguistic studies.

*Pacific Coast.*—The summer field session in archaeology of the University of Washington, directed by Adan E. Traganza, excavated a village site at the northern end of San Juan Island. A portion of the historic Old Man House of Chief Seattle located at Suquamish, Wash., was excavated by William Massey. The Columbia River Basin project of the River Basin surveys under the direction of the Smithsonian institution (*q.v.*) had four excavation parties working under the direction of Douglas Osborne. The party in Chief Joseph reservoir, immediately below Grand Coulee dam, excavated several pit houses and tested others. Another party worked in the Grand Coulee where the outstanding site was a shallow cave containing an interesting range of cultural deposit.

Two other parties operated in Potholes reservoir and McNary reservoir.

*Plains.*—Fieldwork in 1950 was principally devoted to large-scale excavation of outstanding sites discovered by the surveys that had been made of areas to be covered by waters of reservoirs which were under construction or projected. Nearly all the fieldwork was being conducted in co-operation with the River Basin surveys project of the Smithsonian institution. Robert L. Stephenson of the River Basin surveys completed excavations in the Whitney reservoir on the Brazos river in Texas. A variety of sites were excavated. Most interesting were some unexplained large pits 60 to 70 ft. in diameter discovered near Lavon. Jack Hughes and Alex Krieger surveyed the Falcon reservoir area on the lower Rio Grande and discovered a number of sites both historic and prehistoric.

The University of Oklahoma field school under the direction of Robert Bell continued the excavation of the Harlan site in the Fort Gibson reservoir in Oklahoma. This site is a component of the Spiro Focus and yielded house remains. A square-walled rock structure was discovered in a mound.

John L. Champe of the University of Nebraska continued work on the White Cat Village site in the Harlan County reservoir for the third season. In addition several sites of the Upper Republican and Glen Elder cultural phases were investigated.

Two parties were operating in South Dakota during the summer. Carlyle Smith of the University of Kansas led a party in the excavation of part of the Talking Crow site in Fort Randall reservoir. Three cultural levels were found: Upper Republican, Protohistoric Arikara and a late level identified as representing the Dakota of the 19th century. Wesley Hurt of the University of South Dakota also excavated in the Fort Randall reservoir area. At the Swanson site rectangular pithouses were discovered with floors buried beneath four to five feet of overburden.

*Eastern United States.*—The Wisconsin Archaeological survey worked primarily at the Aztalan site. Two houses were found and new data added on stockade features and burials. The University of Michigan began a five-year survey and excavation pro-

gram in the central Mississippi valley between the mouths of the Illinois and Ohio rivers under the direction of James B. Griffin. Excavations were made at the Cahokia mound group in an effort to define further the two Mississippian cultural levels found there and surface surveys were extended down the Missouri side of the Mississippi to Cape Girardeau. This latter work outlined a sequence from eastern Archaic to Mississippian. The Ohio State museum excavated an archaic site near Oxford, O., and found a series of troughlike refuse pits, heavy stemmed projectile points, scrapers, bone awls and needles. A postmould pattern was worked out.

The University of Kentucky partially excavated a large Adena culture burial mound in Mason county. This work was to be completed in the 1951 season. The summer field school of the University of Georgia under the direction of A. R. Kelly continued survey and salvage in the projected reservoir areas of the lower Flint and Chattahoochee. William Sears excavated a burial mound at the Kolomoki site and found quantities of Weeden Island period ceramics and other artifacts. Considerable work was accomplished in Florida. Ripley Bullen of the Florida park service excavated at Madirs Bickel Mound State monument and worked out the chronology of the site. John Goggin conducted the summer field session of the University of Florida at the Zetrouer site, a 17th century Spanish-Indian site, and briefly investigated Fort Pupa, a slightly earlier Spanish fort on the St. Johns river. A large collection of European and aboriginal artifacts was secured.

The Southeastern Archaeological conference met at the University of Tennessee and was well attended. Problems of the classification of stamped wares were the principal topic.

*Southwest.*—The University and the Museum of New Mexico co-operated with the national park service in excavating sites which were to be flooded by the Chamita reservoir on the Chama river. A pueblo dating around A.D. 1300 with some unusual semi-subterranean structures was one of the sites investigated. Paul Martin and John Rinaldo of the Chicago Natural History museum continued their work in the Pine Lawn valley in southwestern New Mexico. The efforts of the 1950 season were particularly directed to the excavation of several dry caves.

David de Harport of the Peabody museum of Harvard continued a survey of sites in the Canyon de Chelly National monument and Charles R. Steen of the national park service spent a second season in the excavation of the Tse-taa site located in the canyon. The remains at Tse-taa range from Basket Maker III to historic Navaho remains. A. H. Schroeder of the national park service made additional excavations at the deep stratified site at Willow beach on the Colorado river. The abundant remains were mainly of Patayan type. This would be covered by water of the Davis reservoir.

The summer field session of the University of Arizona was again held at Point of Pines on the San Carlos Apache reservation in eastern Arizona. A party of archaeologists under the direction of J. L. Nusbaum surveyed the prehistoric sites in the right of way of a natural gas line that was in the process of construction through the Navaho reservation and the Coconino National forest.

The information secured by this work would assure a minimum of damage to antiquities in the course of the pipe line construction.

The 1950 Pecos conference was held at the Museum of Northern Arizona, Flagstaff.

*Middle America.*—Jorge Acosta excavated at Tula and some of the smaller surrounding sites. Most of the work at Tula was concentrated on the Quetzalcoatl structure. The National Museum of Anthropology of Mexico continued work at the remarkable site of Tlatilco. Numerous additional burials were found.

adding considerably to the collection of Middle Culture and Olmec-like grave furnishings. Carlos Margain continued excavations in the Tepantla section of Teotihuacan and Augustin Villagra restored a newly discovered set of mural paintings found there.

Linton Satterthwaite of the University museum of the University of Pennsylvania began a program of investigation of house mounds in British Honduras. At Caracol he found a number of previously undiscovered monuments including stelae with dates. At Benque Viejo a part of a magnificent stucco façade was uncovered in very good condition.

Stanley Boggs continued work at Tazumal for the government of Salvador. This was the tenth season of work at this complex site and considerable information was gathered on the relations of the Tohil plumbate horizon to the local equivalents of Maya classic.

*South America.*—In Chile a party headed by Greta Mostny of the Museo Nacional de Historia Natural conducted an ethnographic survey in the region near the town of Peine in the Atacama desert. Small protohistoric stone buildings with some cut stone at the corners and in door jambs were discovered and the culture was related to the modern occupation.

Wendell C. Bennett of Yale university made a survey of the Montaro basin in the central highlands of Peru and excavated at the extensive prehistoric site of Huari. This latter work suggests strongly that Huari was the highland centre from which the coastal Tiahuanaco culture spread. Mr. and Mrs. Henry Reichlen of the Musée de L'Homme, Paris, completed their work in the Cajamarca region of the northern highlands. Richard Schaedel of the University of Trujillo, Peru, conducted a study of prehistoric architecture on the north coast between Casma and Leche valleys. Two pyramids near Trujillo, El Dragón and Huaca Tacaynamo, were partially cleared of rubbish and sand revealing interesting painted low-relief friezes and a number of small wooden statues.

These sites date in the Chimú period. Several burials of the same time horizon were opened near Chanchán producing a large collection of ceramics and metal objects.

The principal archaeological project underway in Venezuela was a program of excavation under the direction of José M. Cruxent, director of the Museo de Ciencias Naturales of Caracas, and Irving Rouse of Yale university. Three shell middens were investigated on the peninsula of Araya-Manicuare; one without pottery, one with painted pottery and the third a late contact site.

(J. A. Fd.)

**Archery.** The 66th annual tournament of the National Archery association of the United States was held at Franklin and Marshall college in Lancaster, Pa., Aug. 7-12, 1950, with 262 archers from 25 states and Canada participating. Twenty-four new national records were established. The champions and their scores are shown in the table.

The Santa Monica (Calif.) Archery club with a team of three men and one woman won the men's team round (96 arrows at 60 yd.) event, their combined scores totalling 380-2,708, exceeding the previous record by 34 points. The Orioles of Baltimore, Md., won the women's team round (96 arrows at 50 yd.) event with a score of 380-2,468.

The men's international Long round and the women's Hereford round were not shot because of inclement weather. Ann Weber established a new national record of 612 for the single Columbia round.

The regulations for the junior division were changed in 1950. The age limit was raised through 17 years and the rounds were changed accordingly to include greater distances. The Senior American round is now included in the championship events of

### Target Archery

Men's championship	Scores: Double York round Double American round	Stan Overby, Inglewood, Calif. 283-1,755* 180-1,494* 3,249
Ladies' championship	Scores: Double National round Double Columbia round Double American round	Jean Lee, Greenfield, Mass. 144-1,138* 144-1,198* 180-1,476* 3,812
Junior boys' championship	Scores: Double Hereford round Double American round	Michael Moga, Niagara Falls, N.Y. 278-1,724 180-1,336 3,060
Junior girls' championship	Scores: Double National round Double Columbia round Double American round	Betty Wagner, Fond du Lac, Wis. 143-929 144-1,130* 180-1,252 3,311

### Flight Archery

Men	Regular style	Irving Baker, Westfield, N.J.	602 yd. 1 ft.
	Free style	Charles Pierson, Cleveland, O.	617 yd. 2 ft.
Ladies	Regular style	Evelyn Haines, Warren, Pa.	505 yd.*
	Free style	Eunice Modlin, Evansville, Ind.	564 yd.
Boys	Regular style	Harold Duppre, Brentwood, Pa.	344 yd.
Girls	Regular style	Barbara Van Popering, Old Greenwich, Conn.	338 yd.

### Clout Shoot

Men	(36 arrows at 180 yd.)	Lloyd Corby, Denville, N.J.	36-244
Ladies	(36 arrows at 140 yd.)	Ann M. Weber, Bloomfield, N.J.	35-269
Ladies	(36 arrows at 120 yd.)	Ann M. Weber, Bloomfield, N.J.	36-294*
Boys	(36 arrows at 120 yd.)	Don Mitchell, Scott air force base, Ill.	36-248
Girls	(36 arrows at 120 yd.)	Laurette Young, Detroit, Mich.	36-266*

\*Indicates new record.

all divisions, namely, the men's, women's, boys' and girls'. The Columbia round is included in the women's and girls' championship events. The scores of the junior champions established records for their division.

Five contestants, two women and three men, represented the United States in the 14th world championship held in Copenhagen, Den., July 26-31. Jean Lee won the women's championship of the world with a score of 3,254, breaking every known record. Jean Richards of Laguna Beach, Calif., placed second with a score of 2,919, third place going to Mme. Windahl of Sweden with a score of 2,755.

Hans Deutgen of Sweden won the men's championship of the world with a score of 3,141. Tang Holbek of Denmark placed second with 2,878, and Russ Reynolds of Cleveland, O., was third with a score of 2,854.

The 67th national tournament of the National Archery association was to be held at the University of California, Los Angeles, Aug. 20-24, 1951.

Lawrence E. Briggs, University of Massachusetts, Amherst, succeeded Mrs. Olive U. Crouch as secretary of the National Archery association.

FILMS OF 1950.—*Hunting with Bow and Arrow* (Cornell Associates). (O. U. C.)

**Architecture.** In 1950 it was inevitable that the architectural profession would not escape the impact of the Korean war and that the international situation would have an effect on United States architecture. The general effect on the architectural profession may be best described as psychological. However, there were certain tangible effects. Credit controls immediately curtailed building in the small house field. This curtailment occurred at a time when the merchant builders, through the National Association of Home Builders of America, and the architects, through the American Institute of Architects, had started on a collaborative effort to bring good architectural service into the operative building field and to arrange for methods and procedures for carrying out the objectives of the joint effort. This effort was being continued, nevertheless, although it was not anticipated that its effect on the appearance and planning of merchant building would be apparent for a year or so.

The directive on credit controls was followed shortly by restrictive order M-4 of the National Production authority. This was the order banning amusement and recreational building. Its effect on the profession again was immediate, especially as it

Above, left: LEA COUNTY COMMUNITY HOSPITAL opened at Hobbs, N.M., in 1950, featuring inexpensive materials, ample space and gardens to produce an informal atmosphere. William L. Pereira, architect; Truman Matthews, associate

Above, right: "BIRD CAGE HOUSE" completed in Miami, Fla., in 1950, as a practical answer to year-round living in a tropical climate. Living quarters (left) were concealed inside a two-story screened patio with entire south and west sides nothing but screen over a wooden frame. Igor B. Polevitzky, architect

Right: MODEL OF THE LAKE SHORE CO-OPERATIVE apartments being erected at Chicago, Ill., in 1950. The all steel and glass tower had floor-to-ceiling windows and was designed for radiant heating through ceiling and floors. Ludwig Mies van der Rohe, architect

Below: COMMONS BUILDING at the Harvard Graduate centre, Cambridge, Mass., first occupied in 1950. The group of eight buildings, seven of them dormitories, formed a series of large and small quadrangles with most buildings joined by covered walks. Walter Gropius, principal architect, in collaboration with seven associates forming The Architects Collaborative

was apparently the forerunner of further restrictive orders to come. The original order contained a drastic sentence, stating in effect that the government could halt any building at any time, even after construction had commenced and regardless of whether or not an official permit had been obtained. Had this sentence prevailed, not only the profession but the construction industry and the general economy itself might have been seriously affected. Through the efforts of the American Institute of Architects, the National Production authority was prevailed upon to eliminate this sentence.

The slight panic, which may have existed here and there in the profession at the outset of the Korean war, quickly evaporated. There was a reluctance on the part of the contractors to submit firm bids. However, that reluctance appeared to be lessening toward the end of the year. Curiously enough there arose an interesting stimulation of immediate planning in various nonmilitary fields. This was the result of a desire to get the planning work under way, and if possible construction also, before the country might find itself in a serious predicament. As the year closed, the outlook for the profession was more stable than it had been six months earlier.

**Residential.**—Considerable interest was focused in 1950 upon the public housing program. At the close of the year this program was almost exclusively in the planning stage, and the rise in prices was causing a drastic change in the planning phases. It was obvious that, under existing authorizations and appropriations, the program could not be carried out as originally contemplated. The official remedy had been a cutting down on space allotments and an elimination of any semblance of superfluity of architectural design.

In the private residential field there was in some areas a marked falling off in construction of what is loosely termed a "luxury house." Houses well out of the low-cost range were being built in Texas, Nebraska and other places which hitherto had not been especially noteworthy in this field. An interesting manifestation was the building of fine homes for well-to-do farmers and ranchers in remote parts of the middle west. Very often in these houses the architects had the opportunity to develop completely contemporary and up-to-date structures, some of which were located far from the beaten path.

In the smaller private residential field, many interesting modern houses were designed and built, and indications were that so-called modern architecture was passing through its growing stages and was arriving at maturity. In many of these houses the modernistic clichés had been eliminated or forgotten. However, where the design of modern houses had fallen into less capable hands, or in some instances had fallen outside the hands of the profession completely, the imposition of modern clichés on the long-accepted plan did not serve to advance progressive architecture. Taking all residential work into consideration—public, government-financed and private (except in a few parts of the country)—the established American way of living had not indicated that it was undergoing much promise of advance. On the contrary, save for sporadic outbreaks of "ramblers" or ranch-type houses, the two-story Cape Cod cottage with the tightly landscaped front lawn and the small back yard was still being built in quantity. The American way of life, as enjoyed by the masses, still called for living in the public view, the only token of advance being the forest of television masts.

**Techniques and Materials.**—There was an increasing concentration on research, in which activity the American Institute of Architects was taking a leading role, as was the Building Research Advisory board, set up under the National Research council and supported in whole by the construction industry.

The construction industry also established a project to explore and advocate modular co-ordination. This was being carried

out under the immediate direction of the American Institute of Architects and was expected to have a profound effect on architectural design in general. The architects were leading this effort. The profession was also active in the study of climatology, which is the carrying out of a scientific approach to those weather conditions which should affect the design of buildings.

**Commercial.**—The general tendency toward decentralization throughout the country offered the architect a further opportunity to develop a relatively new and fast-growing field of design. His principal contributions during 1950 were in the shopping centre and in the development of the supermarket, a peculiarly American institution.

Further studies were made in the field of indoor and outdoor automobile parking facilities, and new and ingenious developments were being carried out in public garages. The open-air movie which, in its initial development, seemed to offer little opportunity to the architect, had progressed to a point where architectural service was demanded, and some architects had become experts in this field. No longer was the open-air movie simply a screen set up in a vacant lot; it had become a thoroughly planned centre of amusement, calling for architectural ability.

The auto court or motel was another field in which considerable architectural progress was made during the year. Among the attractive and inviting new motel projects were those on the outskirts of Wilmington, Del., Dallas, Tex., and in many other places, especially in the west and southwest.

In 1950 office building design was characterized by an increased simplicity which tended to border on barrenness, and save for the U.N. building in New York city, which was a special-purpose building, no particular innovation was forthcoming. The year saw a breaking away from the skyscraper per se. There no longer appeared to be a striving for a building higher than its fellows in order to enhance the building and the owner's prestige (possibly to his financial disadvantage).

**Schools.**—There was a renaissance of research resulting in a radical change in the approach to school planning and in school building itself. Notable work in this line was accomplished in California, Chicago and its environs, and in many other places throughout the country.

**Governmental.**—In governmental architecture the trend toward simplicity was also evident. Great attention was paid to the function of the building and to the lowering of maintenance cost. That these objectives could be achieved with a corresponding improvement in the architectural appearance of a building was exemplified in Louis Justement's courthouse, which was under construction in Washington, D.C.

To sum up architectural progress of 1950, there was an intelligent concentration on study and research, an adaptability to the national economic pattern, and a steady advance, despite a momentary uncertainty brought about by the disturbed international situation.

(ED. R. P.)

**Great Britain.**—The completion of the new house of commons was the architectural event which attracted most attention during 1950. The "Tudor Domestic" style of the new chamber inevitably aroused controversy. There were those who believed that each age should have the courage of its own architectural convictions and could see no reason why the new chamber was not frankly contemporary. In his planning it was generally agreed Sir Giles Gilbert Scott had exercised considerable ingenuity. With only a slight addition in total height three extra floors had been fitted in. Accommodation in the chamber itself was increased from 802 to 939, chiefly by replanning and extending the galleries. The new floor of the house was not made larger since it was thought important to retain that sense of intimacy in debate which is characteristic of the house of commons. An

elaborate and advanced system of air conditioning was designed by Oscar Faber.

On the south bank site of the 1951 Festival of Britain the installation of the internal equipment for the permanent concert building, to be known as the Royal Festival hall, was well under way by the end of the year, and was to be completed in time for the opening on May 3, 1951.

In the city of Westminster the housing problem was still very acute and drastic measures were needed to deal with it. In 1945-46 a competition had been held to provide designs for a large number of dwellings on a site which covered 30 ac. and stretched 600 yd. along the north bank of the Thames at Pimlico. The winner was the firm of Powell and Moya, and the first block of flats in the scheme was completed in Oct. 1950. Density would be at 200 persons an acre and, apart from the flats, there would be about 30 shops, laundries, a mortuary, a restaurant, public lavatories and a service station with an underground garage for 200 cars. Space heating and domestic hot water were provided by a district heating system utilizing waste heat from Battersea power station which faced the site across the river.

**Australia.**—Designs were published for the new National university at Canberra. The architect was Brian B. Lewis of the University of Melbourne. His designs were based on a main axis which followed a well-defined ridge of ground. At one end, above a future lake, there would be an open-air auditorium and along the ridge, ranged at each side of a central lawn, the library, administrative offices and public lecture rooms. University house, at the other end of the axis, would be the social focus of the university.

**South Africa.**—In order to provide accommodation for the rapidly growing population of Salisbury, the capital of Southern Rhodesia, the city council inaugurated a scheme for a block of flats which would be the highest building in Rhodesia. Designed by the firm of Ross MacKenzie, Van Heerden and Hartford, it would comprise 108 one-room and 84 two-room flats on 12 floors. The foundations would be a reinforced concrete raft and spreader beams and the main structure, a series of parallel spine walls, would be carried at ground-floor level on piers similar to those of Le Corbusier's *Unité d'Habitation* near Marseilles. Windows would be continuous, and protected by hoods against the mid-day sun. Finishes would be of brick and fair-faced concrete, with aluminum cladding for the projecting fins of the spine walls and a polished stone veneer round the main entrances. The flat reinforced concrete roof would be surfaced with bitumen, screed and a light "umbrella" of corrugated asbestos. Vertical expansion joints would divide the building into seven separate structures.

**Europe.**—In Hungary and Czechoslovakia a number of good modern buildings were completed, apparently still free from the stultifying grip of Stalinist aesthetic theory. In Hungary the most interesting buildings were the new school for apprentices attached to the Matyas Rakosi metal foundry, and the clinic at Vjpest by Kiss Ferenc. In Czechoslovakia, a 13-story block of flats for factory workers was completed at Horní Litvínov. The flats provided accommodation for single people and families and included day nurseries, a nursery school and a central kitchen with canteen. The structure, of steel with brick infilling, was faced with prefabricated panels.

Switzerland's most notable buildings were both in Geneva. One was a block of flats by Marc T. Saugey. The other, a Protestant church and assembly hall with an exposed reinforced concrete frame, by W. M. Moser of Haefeli, Moser and Steiger, had walls of specially designed concrete blocks and circular sheets of glass. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING; TOWN AND REGIONAL PLANNING.) (I. R. M. M.)

FILMS OF 1950.—*Art and Life in Italy* (Coronet Instructional Films).

**Archives, National.** The national archives and records service is a part of the General Services administration. It superseded the national archives establishment, an independent agency created by congress in 1934, which was transferred to the General Services administration effective July 1, 1949. It consists of the records management division, the national archives, the federal register division and the Franklin D. Roosevelt library at Hyde Park, N.Y., and in 1950 was headed by Wayne C. Grover, archivist of the United States.

The national archives and records service prescribes standards and methods for the efficient management of the government's current records; supervises the administration of records centres, where noncurrent records being processed for disposal are stored inexpensively; selects, preserves and administers in the national archives those federal records that have enduring value; publishes the daily *Federal Register*, the *Code of Federal Regulations*, the *Statutes at Large* and the *U.S. Government Organization Manual*; and administers the paper and collections of Franklin D. Roosevelt and related materials in the library at Hyde Park.

The new records management division began its nation-wide program to improve government records practices. Regional records centres were established in New York city, Chicago, San Francisco and Alexandria, Va.; and a manual on the *Disposition of Federal Records* was issued.

By the end of 1950 there were more than 900,000 cu.ft. of permanently valuable records in the national archives. During the year 385,000 reference services were performed on these materials for the government and the public. Responsibility for the compilation and publication of *The Territorial Papers of the United States* was assigned to the national archives during the year.

The 1949 edition of the *Code*, the first since the original 1938 edition, was completed and published during 1950 by the federal register division which also issued the daily *Register*, published the annual *Government Organization Manual*, and took over from the state department the responsibility for publishing the *Statutes at Large*.

A large part of the papers of Pres. Franklin D. Roosevelt in the Franklin D. Roosevelt library were made available for research in March 1950.

(W. C. G.)

## Areas and Populations of the Countries of the World.

The political entities of the world are listed here with their areas, populations and number of persons per square mile. The latest census or official estimates are given for each country. Areas in square miles are in accordance with the boundaries for the year of the population figure unless otherwise noted. Some of the later boundary adjustments had not been recognized at the end of 1950 by the U.S. government. The subtotals for colonial groupings within continents do not carry density figures.

Where two figures are given for a country, the most recent is used in the continental and world totals.

The table, on this and the following page, provides a fundamental basis for country comparisons.

Areas and Populations of the Countries of the World  
(For statistical details and dates see separate country and empire articles)

Name of continent and state	Area (in sq.mi.)	Population (in thousands)	Persons per sq.mi.
World total . . . . .	58,062,977	2,388,939	45.9*

\*In computing the world density the area of Antarctica is omitted.

†Includes Eritrea as military trustee area.

‡Areas and populations of Baltic republics included in 1950 and 1946 U.S.S.R. totals.

**Argentina.** A republic in southern South America, Argentina is bounded on the north by Bolivia, Paraguay and Brazil; on the south and west by Chile; and on the east by Uruguay, the River Plate and the Atlantic ocean. Next to Brazil, it is the largest country in South America, with an area of 1,079,965 sq.mi. and a population of 17,097,889 (est. June 1950), mostly of European ancestry. The capital and leading port, Buenos Aires, has a population of 3,000,371 (1947 census). Other principal cities are: Córdoba, 351,644; Avellaneda, 279,572; La Plata, 271,738; Lanús, 242,760; Santa Fé, 168,011; Tucumán, 152,508; Mendoza, 105,328; Mar del Plata, 104,513; Bahía Blanca, 93,122. Religion: Christian, mostly Roman Catholic. President: Gen. Juan Domingo Perón.

**History.**—During 1950 the Perón regime continued to ride hard on its critics and enemies at home, maintained its arbitrary restrictions on civil liberties, kept a strict control on business and financial enterprises and generally consolidated its position in power. The gloomy economic outlook during the early part of the year was improved by the rearmament program forced upon the free world by the Korean war. Political and economic relations with the United States improved and the Peronista party seemed to be in full control.

The political feud which forced the retirement of Juan A. Bramuglia as foreign minister in 1949 had further repercussions in 1950. Z. R. del Campo resigned as minister counselor of the embassy in Washington, D.C., in a strongly worded letter to the foreign office, thus expressing his solidarity with Enrique Corominas, former ambassador to the Organization of American States, and José Arce, former delegate to the United Nations. The campaign to draft Bramuglia as a presidential candidate against Perón was ended when he announced that he would not accept the nomination and would enter the private practice of law. Members of the opposition and independents were disillusioned by this, but it was generally recognized that under existing laws it was almost impossible to organize a political party. Oscar Ivanissevich, former ambassador to Washington and minister of education, fell out of favour and resigned his post in May. Armando Méndez San Martín, director of the Eva Perón Social Aid fund, was appointed as the new minister of education.

Provincial elections were held in 1950 in Entre Ríos, Buenos Aires province and San Luis. The Peronistas won all three elections. A comparison with the last previous election showed that in Entre Ríos the Peronistas lost 7,000 votes and the opposition

gained 5,000 and in Buenos Aires the government increased its total votes by 18% and the opposition showed a 36% gain. The San Luis election was the first in which women participated, although they were given the right to vote in 1947. It was the last election to be held prior to the presidential election in Feb. 1952. Elections had been held in 10 of the 14 provinces since Dec. 1948 when the constituent assembly was elected. The Peronistas lost ground in all of them. They lost an average of 4.37% of the vote and the Radicals gained 5.1%, mostly at the expense of the Socialists and Democrats. The Communists also lost ground, and the Peronistas claimed that they had gone over to the Radicals. Opposition candidates Ricardo Balbín and Isaías Juan Nogues were arrested for disrespect to Perón. The former was given a five-year term and deprived of his political and civil rights.

A draft was launched for Perón's re-election in 1952 with Eva Perón as vice-president.

Perón decreed that 1950 be celebrated as the "year of San Martín," to honour the Argentine liberator. Upon his recommendation the Inter-American Treaty of Reciprocal Assistance negotiated at Rio de Janeiro was ratified. The opposition labelled this "subservience to Yankee imperialism" and forced Perón to tone down his international policies in favour of a more nationalistic approach. In a speech before the National Commission for Economic Co-operation in February Perón stated that in the future the government would be interested in nationalizing only the public utilities. This led to speculation in diplomatic circles, since the United States held large interests in Argentine public utilities and it was not known whether petroleum was considered a public utility. In his address at the opening of congress in May, Perón said that foreign enterprises investing in Argentina would enjoy full freedom and receive a fair return on their capital. He asserted that capitalism as an economic system was doomed and that all the west could offer was liberalism, which had failed. In the struggle between capitalism and communism Perón again suggested, as he had done several times during the year, that he represented a "third way."

A Joint Argentine-United States Committee of Commercial Studies was established to consider granting a \$125,000,000 credit to foster foreign trade. In February Assistant Secretary of State Edward G. Miller went to Buenos Aires to initiate negotiations. At first the Perón press was hostile, but toward the end of his visit their tone changed, indicating that some progress in improving United States-Argentine relations had been made. Economy Minister Ramón A. Cereijo later went to Washington to continue negotiations with the Export-Import bank. The loan was to be repaid in 20 half-yearly instalments, the first of which was due in June 1954. The interest was 3½%, and although the government was responsible for the loan, it was made through ten commercial banks, several of which were official or semiofficial.

Congress promoted Perón to a major general; refused to pass a law banning Communists, but approved a drastic law to repress sabotage, espionage and treason. The law provided that anyone who "in any way provokes public alarm or lowers public morale" might be sent to prison from one to eight years. Unauthorized publication of secret or restricted government information was also punished. In all cases severe prison terms were provided in peacetime and death in times of war. The law also punished agents of a foreign country operating against another foreign country on Argentine soil.

The government nationalized all uranium deposits and created an atomic energy commission to work through the ministry of technical affairs.

(J. McAd.)

**Education.**—In 1949 there were 14,649 primary schools, with 2,074,233 pupils and 91,024 teachers. The 744 secondary, normal and special schools had 185,283 students; they included 136 national colleges with 44,901 students, 219 national normal schools with 67,968 students and 91 na-

tional commercial schools with 25,973 students. The 670 incorporated (i.e., private) secondary, normal and special schools had 55,693 students. There were national universities at Buenos Aires (34,988 students), La Plata (18,181), Córdoba (8,881), Cuyo (6,749), Tucumán (2,308), the national university of the Litoral at Santa Fé (17,716) and the technical institute at Bahía Blanca (254).

**Finance.**—The monetary unit is the peso, valued on Nov. 23, 1950, at \$0.1333 U.S. currency, basic rate, \$0.2000, preferential rate and \$0.0698, free market rate. Imports into Argentina were paid for at one of the three rates, depending upon their respective importance to the economy. Authorized nontrade remittances from Argentina were effected at the free market rate. The 1951 budget, as approved by congress in Aug. 1950, totalled 13,073,900,000 pesos (1950: 11,258,400,000 pesos), distributed as follows: national administration 4,844,000,000 pesos (balanced by general revenue with an estimated surplus of 100,000 pesos); public works 1,059,600,000 pesos (to be covered by borrowing with the exception of 100,000 pesos); autonomous agencies (railways, oil fields, etc.) 5,987,900,000 pesos (self-balancing); special accounts 1,182,400,000 pesos (self-balancing). In addition, about 1,300,000,000 pesos were allocated for the five-year plan and were to be covered by borrowing. Expenditure of the national administration amounted to 4,477,000,000 pesos in 1949; general revenue totalled 4,581,600,000 pesos. The national debt was 16,643,000,000 pesos on June 30, 1950 (Dec. 31, 1949: 15,194,500,000 pesos; Dec. 31, 1948: 12,940,000,000 pesos), of which 14,450,000,000 pesos represented the funded debt and 2,192,500,000 pesos the floating debt. The debt figures did not include the debt of the Institute for Trade Promotion (I.A.P.I.), estimated at 9,300,000,000 pesos on Dec. 31, 1949, nor that of the official agencies and of provincial and municipal governments. Currency and subsidiary money in circulation on Sept. 30, 1950, totalled 9,631,000,000 pesos, and on that date the Central bank had gold holdings of \$216,000,000. Bank clearings averaged 16,360,000,000 pesos a month in 1949 and totalled 18,696,000,000 pesos in June 1950.

**Trade and Communications.**—Exports in 1949 were officially valued at 3,717,500,000 pesos (1948: 5,465,000,000 pesos); imports amounted to 4,045,400,000 pesos (1948: 5,341,000,000 pesos). Exports were divided as follows: meat, wool, hides and other animal products 50.46%; agricultural products 45.01%; manufactured goods 1.95%; forest products 2.33%. Leading imports were machinery and vehicles (21.5%), textiles (18.6%), iron and steel (16.3%), fuel and lubricants (10.7%) and timber (6.6%). Leading customers were the United Kingdom (22.8%), Brazil (10.9%), the U.S. (10.7%), Italy (9.1%) and Spain (4.8%). Principal suppliers were Italy (15.9%), the United Kingdom (15.6%), the U.S. (14.8%), France (10.0%), Brazil (7.6%) and India (5.8%).

The railway system totalled 26,923 mi. in 1949 (including the Argentine section of the new Salta-Antofagasta line), all of which was owned and operated by the government. National highway mileage in 1949 was about 43,500, of which about one-fourth was paved or improved. On Jan. 1, 1950, it was unofficially estimated that Argentina had 219,870 automobiles and 140,840 trucks. According to *Lloyd's Register of Shipping*, the merchant marine (June 30, 1949) had 357 steamers and motorships (100 tons and over) aggregating 814,274 gross tons and 46 sailing vessels and barges aggregating 20,566 tons.

**Agriculture.**—Acreage and production figures for the crop year 1949-50 were officially reported as follows: wheat, 14,064,932 ac., 5,670,231 short tons; linseed, 2,662,550 ac., 744,934 tons; maize, 5,287,940 ac., 930,140 tons; oats, 3,038,342 ac., 595,352 tons; barley, 1,984,213 ac., 435,098 tons; rye, 4,703,473 ac., 305,447 tons; sunflower, 4,463,367 ac., 701,614 tons. Exports during the period Jan. 1-Dec. 14, 1950, were estimated in short tons as follows (total for entire year 1949 in parentheses): wheat 2,923,225 (2,018,262); maize 873,834 (1,203,221); linseed 122,789; oats 419,560 (213,740); barley 102,750 (219,371).

The livestock census of July 1, 1947, showed 41,268,470 cattle, 7,237,663 horses, 50,856,556 sheep, 2,981,406 pigs and 4,933,679 goats. Wool exports in the wool year ending Sept. 30, 1950, were 383,863 bales, of which 238,574 went to the U.S. and 56,924 to France. Livestock slaughtered in 1949 included 8,930,700 cattle, 7,472,200 sheep and 1,768,300 pigs. Meat exports in 1949 included 4,609,417 frozen beef quarters, 635,838 frozen mutton carcasses, 2,636,202 frozen lamb carcasses and 82,144 short tons of canned meat. Exports of hides and skins included 2,612,251 calf skins, 647,209 dried ox hides, and 5,959,329 salted ox hides. Dairy exports included 92 short tons of butter (1948: 13,462 tons) and 26,152 tons of casein. Exports of quebracho extract were estimated at 152,036 short tons, of which 30,821 tons were re-exported from Paraguay.

**Manufactures.**—Industrial establishments numbered 101,884 in 1947 (65,803 in 1943). Most important were the meat-packing establishments, flour mills and textile mills. In 1949 there were about 100 woollen spinning mills, 180 woollen textile plants, 34 cotton spinning mills and 200 cotton textile plants. Estimated production data in 1949 included cement 1,600,000 short tons; iron and steel products 188,000 tons; electric energy (consumption) 3,312,000,000 kw.hr. Imports of iron and steel products totalled 590,655 short tons in 1949. The cost-of-living index stood at 300.9 in Aug. 1950 (1943=100).

**Mineral Production.**—Petroleum production in 1949 totalled about 22,500,000 bbl.; imports (crude only) were 12,200,000 bbl. Gold, lead, zinc, copper, tin and coal were also produced. Coal imports in 1949 were 1,361,766 long tons, of which 987,780 tons came from the United Kingdom and 225,289 tons from the Union of South Africa.

(J. W. Mw.)

**Arizona.** Arizona, nicknamed the "Grand Canyon State," lies in the southwestern part of the United States; the Colorado river forms most of the western boundary. Its area is 113,909 sq.mi. The official census determination for 1950 gave

the state a population of 749,587, a 50.1% increase above that of 1940. The 1940 census gave rural population, 65.2%; urban, 34.8%; foreign-born whites (including Mexicans) 7.3%; other races, including Negroes and Indians, 14.4%. The capital is Phoenix with a preliminary population estimate (1950) of 105,003; other cities with similar estimates were: Tucson, 45,064; Mesa, 16,766; Douglas, 9,393; Yuma, 9,095; Glendale, 8,174; Tempe, 7,688; Prescott, 6,734; and Morenci, 6,549.

HOWARD PYLE, Republican, elected governor of Arizona, Nov. 7, 1950

**History.**—The state's officers (1950) were: chief justice, Arthur T. La Prade; governor, Dan E. Garvey; secretary of state, Wesley Bolin; treasurer, J. W. Kelly; attorney general, Fred O. Wilson; superintendent of public instruction, Marion L. Brooks. In the 1950 Democratic primary Dan Garvey was defeated by Mrs. Ana Frohmiller, gubernatorial candidate; but the November election was won by Howard Pyle, Republican candidate. The other officials were re-elected, except for the treasurer (E. T. Williams) and all were Democrats. Since the 19 state senators were Democrats, as were 61 of 72 house members, and since the Republican governor-elect had to make 79 appointments to 54 state departments and agencies, he early entered into conferences with members of the opposite party. Two special sessions of the 19th legislature were called by Governor Garvey. The office of post auditor was created, appointment to be made by the president of the senate and the speaker of the house with the advice and consent of the two houses. A measure was passed providing for the leasing of state lands to cattlemen. A mistake of more than \$500,000 was made in the wording of an appropriation bill so a second session was necessary.

**Education.**—The net enrolment and the number of teachers in the public schools for 1949-50 stood respectively as follows: elementary schools, 122,413 and 3,875; high schools, 30,485 and 1,361. There were 12 accredited private secondary schools in addition to parochial and private elementary schools in various towns.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The total number of recipients of grants and social services for Nov. 1950 was 21,450. The state welfare appropriations for 1950 were: for girl juvenile offenders, \$139,525; aid to the blind, \$365,000; dependent children, \$1,950,000; old-age assistance, \$3,965,584; crippled children, \$153,100; direct relief, \$625,000; industrial school, \$161,838; prison, \$431,700; state hospital, \$934,260; pioneer home, \$127,062.

**Communications.**—Arizona highways for 1950 were as follows: mileage of primary state highways, 3,933; county roads, 15,847; federal aid highways, 2,486; national roads, 7,891. Railroad mileage at the beginning of 1950 was 2,090. There were 154,623 telephones. There were 12 air lines to the east and 6 to the west from Arizona.

**Banking and Finance.**—National banks, Oct. 4, 1950, had deposits of \$305,562,687; loans and discounts, \$161,532,558; U.S. government securities, \$78,818,064. State banks had deposits of \$106,355,382; loans and discounts, \$31,915,133; U.S. government securities, \$50,522,051.

**Agriculture.**—The lettuce crop for 1949 was 6,820,000 crates. The long-continued hot weather during the autumn of 1950 caused much to go to seed with an estimated loss of 3,500 carloads.

**Manufacturing.**—Production of manufactures, exclusive of smelting, for the fiscal year 1949-50 was \$130,666,830, a decrease of \$4,107,759 from the previous fiscal period. In June 1950 there were 16,000 workers employed.

Table I.—Leading Agricultural Products of Arizona

Crop	1950	1949	1939-48 Average
Barley, bu. . . . .	6,520,000	5,440,000	2,602,000
Wheat, bu. . . . .	672,000	700,000	583,000
Oats, bu. . . . .	300,000	330,000	283,000
Grain sorghums, bu. . . . .	3,784,000	2,684,000	1,562,000
Corn, bu. . . . .	396,000	420,000	352,000
Alfalfa seed, bu. . . . .	234,000	208,000	118,100
Flaxseed, bu. . . . .	247,000	950,000	438,000
Cotton, bales . . . . .	440,000	543,000	188,000
Grapefruit, boxes . . . . .	3,000,000	3,400,000	3,244,000
Oranges, boxes . . . . .	1,250,000	985,000	866,000
Potatoes, bu. . . . .	1,704,000	1,268,000	1,072,000

Table II.—Mineral Production of Arizona

Mineral	Production 1949	Value
Copper . . . . .	713,000,000 lb.	\$140,461,000
Gold . . . . .	110,600 oz.	3,871,000
Silver . . . . .	5,070,000 oz.	4,588,350
Zinc . . . . .	140,100,000 lb.	17,932,000
Lead . . . . .	66,800,000 lb.	10,621,200

**Mineral Production.**—The estimated copper production for 1950 was the second highest in the state's history, exceeding that of 1949 by 74,000,000 lb. Plans were made for two new developments in the Bisbee and Globe-Miami areas. (H. A. H.)

**Arkansas.** Arkansas, a south-central state of the United States, was admitted to the union in 1836. Termed the "Wonder state," its area is 53,102 sq.mi., including about 400 sq.mi. of water. The population was 1,949,387 in 1940; the official 1950 census determination showed a population of 1,909,511, a 2% loss. Indications were that the 1950 population was 67.6% rural. The 1940 population was 77.8% rural. The Negro population, principally in southeastern Arkansas, was 482,578 in 1940.

The capital city, Little Rock, had 101,387 (preliminary 1950 U.S. census report) inhabitants. Other cities and preliminary 1950 population: Fort Smith, 47,864; North Little Rock, 42,142; Pine Bluff, 37,147; Hot Springs, 29,298; El Dorado, 23,047; Fayetteville, 17,024; Jonesboro, 16,260; Blytheville, 16,221; Texarkana, 15,833.

**History.**—An initiated statute, ratified at the general election in Nov. 1950, prohibits the "open range" grazing of livestock on a state-wide basis. Three initiated measures were defeated at the general election: for state-wide prohibition, constitutional earmarking of revenues for public schools, and four-year terms for elective officers. The amendment of Democratic party rules during 1950 admitted Negro voters and candidates for nomination to the party primaries. A survey of higher education in the state was completed and a commission on state government reorganization was active during the year. Sidney McMath defeated Ben Laney for the Democratic nomination for governor in the primary on July 25 by a vote of 209,559 to 112,651.

McMath defeated Jefferson W. Speck, Republican, in the gubernatorial election on Nov. 7 by 266,778 to 50,309. The principal state officers inaugurated in Jan. 1951 were: Sidney McMath, governor; Nathan Gordon, lieutenant governor; Ike Murry, attorney general; C. G. Hall, secretary of state; J. Oscar Humphrey, auditor; J. Vance Clayton, treasurer, Claude Rankin, land commissioner.

**Education.**—There were 1,983 elementary schools during the year ending June 30, 1950, and 610 secondary schools. Elementary school enrolment was 293,980; secondary 131,193. Teachers and principals in elementary schools numbered 7,995; in secondary 5,345. Expenditures during the year ending June 30, 1950, by the state government to school districts amounted to \$24,395,969. Facilities for pupil transportation, a program for benefit of handicapped children, and the school lunch program were expanded during 1950. A. B. Bonds, Jr., was commissioner of education.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—During the calendar year 1950, old-age assistance grants totalling \$20,483,097 were paid to a monthly average of 66,187 recipients. A monthly average of 16,870 families received a total of \$8,480,236 for dependent children; an average of 1,796 blind persons received \$719,214; an average of approximately 2,613 general relief cases received approximately \$401,441. Unemployment benefits totalling \$7,369,544 were paid during the year to a weekly average of 12,525 beneficiaries. Arkansas maintained three penitentiaries and four reformatories at a total expense of \$1,107,716 during fiscal 1950. There were 1,541 adult and 200 juvenile inmates in penal institutions on Dec. 31, 1950.

**Communications.**—Expenditures by the state government on highways in fiscal 1950 totalled \$16,229,628. The state highway system comprised approximately 9,722 mi. at the end of 1950. County highways not in the highway system had a mileage of approximately 53,000. About 785 mi. of roads in the state highway system were paved, surfaced or graded during 1950. Main-track railway mileage was 4,269.76; airway mileage, approximately 832. There were 91 airports at the end of 1950. Approximately 253,000 telephones were in use at that time.

**Banking and Finance.**—There were 176 state and 52 national banks on Dec. 31, 1950. Deposits in state banks on June 30, 1950, totalled \$354,288,141; resources \$383,814,993. Deposits in national banks on Oct. 4, 1950, totalled \$393,496,000; resources \$426,323,000. The 6 state and the

35 federal saving and loan associations in Arkansas had total resources of \$65,186,000 on June 30, 1950. Real and personal property tax assessments, listed by law at 20% of value, totalled \$694,535,000 during 1950. State treasury revenues during the calendar year were \$120,934,175; expenditures \$156,924,553. The gross state government debt on Dec. 31, 1950, was \$124,905,500; the net debt was \$116,668,600.

**Agriculture.**—The crop reporting service estimated the value of principal crops harvested from 5,715,000 ac. during 1950 at \$442,000,000, or 10% above 1949. This increase was due entirely to higher prices, as the volume of the crop in 1950 was 13% below 1949. Cash receipts during 1950 from farm marketings, estimated on the basis of preliminary data for the first ten months of the year, totalled \$585,593,337. Receipts from crops were \$425,000,000; from livestock and products \$155,000,000; from government payments, \$5,593,337.

Cotton acreage, as compared with 1949, declined 860,000 ac., and rice 55,000 ac., partly as a result of acreage allotments. Partially offsetting these declines were increases of 248,000 ac. for corn and 265,000 ac. for soybeans. Cool, cloudy, wet weather during July, August and September was very unfavourable for cotton, but corn, sorghums, soybeans, rice and hay did well. A fine crop of corn was produced, but wet weather after early corn matured caused considerable loss and reduced quality. Nearly ideal weather in October permitted rapid progress in harvesting of late crops.

Table I.—Leading Agricultural Products of Arkansas

Crop	1950	1949	Average 1939-48
Corn, bu. . . . .	38,610,000	28,368,000	31,598,000
Cotton, bales . . . . .	1,100,000	1,632,000	1,393,000
Cottonseed, tons . . . . .	442,000	674,000	571,000
Hay, tons . . . . .	1,623,000	1,681,000	1,589,000
Rice, 100-lb. bags . . . . .	7,975,000	8,856,000	6,024,000
Soybeans, bu. . . . .	11,676,000	5,820,000	2,980,000

**Manufacturing.**—The value of manufactures in 1950 was about \$650,000,000. Wages in manufacturing during the year, totalling approximately \$161,000,000, were paid to a monthly average of 72,800 employees. During 1950, according to the state Resources and Development commission, 107 new industrial units located in the state, and substantial expansions were made in 26 existing industries. Greatest number of new units were listed in food processing, finished lumber and lumber products, and metal-working plants.

Table II.—Principal Industries of Arkansas

Industry	Value added by manufacturing	
	1947	1939
Chemicals and allied products . . . . .	\$29,194,000	\$4,303,000
Food and kindred products . . . . .	41,020,000	12,414,000
Lumber and products . . . . .	92,800,000	29,596,000
Paper and allied products . . . . .	21,887,000	4,443,000
Petroleum and coal products . . . . .	17,064,000	3,894,000
Primary metal industries . . . . .	18,885,000	747,000
Stone, clay and glass products . . . . .	10,237,000	2,736,000

Table III.—Principal Mineral Products of Arkansas

Mineral	Estimated value, 1950	Value, 1949
Borite . . . . .	\$4,761,000	\$6,104,935
Bauxite . . . . .	7,267,000	6,138,085
Coal . . . . .	6,764,000	7,061,239
Natural gas, marketed . . . . .	4,722,000	5,677,407
Petroleum and products . . . . .	69,365,000	73,954,653

**Minerals.**—Minerals produced during 1950, as estimated by the state geologist on the basis of severance tax collections, had a value of about \$130,000,000. Production in 1949 was valued at \$133,232,312. Wildcatting for oil and gas during 1950 was active, and oil fields in southwestern Arkansas and a gas field in western Arkansas were discovered. Facilities for reduction of aluminum were expanded during the year. (H. M. A.)

**Armies of the World.** During 1950 all armies of the world received increased attention as a major war commenced in Korea and the outbreak of World War III seemed closer.

There were five outstanding developments affecting the ground forces during the year:

On June 25 the Communist-trained and led army of North Korea invaded South Korea, precipitating a war between Communist and United Nations forces.

An American, Gen. Dwight D. Eisenhower, was named commander in chief of the forces of the North Atlantic powers.

The United States abandoned attempts to economize on its defense establishment, passed a new draft law and commenced major shipments of arms to North Atlantic treaty nations while greatly expanding its own ground forces.

Communist China intervened in Korea after United Nations troops had crushed the North Koreans, launched an invasion of Tibet and built up its forces in Kwangtung for a possible amphibious thrust at Formosa or support of the Communist forces in Indochina.

France continued to hold the key areas of Indochina against assaults of the Viêt-Minh.

**The Korean War.**—The long expected but not immediately anticipated attack by Communist North Korea on South Korea was launched on June 25. With superior arms, equipment and training the North Koreans quickly overran the South Korean border positions, captured the capital of Seoul and threatened to destroy all resistance. The United States took the initiative in aiding the South Koreans, followed almost immediately by nearly all of the non-Communist countries in the United Nations. Two days after the attack Pres. Harry S. Truman pledged U.S. air and naval support to South Korea. As it became apparent that such support was insufficient to hold the attack, U.S. ground forces were thrown into the battle.

The North Korean army entered the conflict with approximately 15 divisions of 6,000-8,000 men, about 100,000 of whom had fought in the Chinese Communist armies in Manchuria. Supporting the North Korean attack were several hundred 32-ton T-34 tanks of soviet manufacture. These tanks, mounting 76-mm. guns, were relatively unchallenged on the ground except in isolated actions, until heavy U.S. equipment including General Patton tanks commenced arriving in early July.

Initial U.S. forces to enter the battle in Korea were troops from Japanese occupation duty. The 24th infantry division was committed in company and battalion strength as it arrived. Delaying actions mounted by this division, the 25th infantry and the 1st cavalry, also from Japan, permitted the withdrawal of the remnants of the South Korean army into a beachhead around the big supply port of Pusan.

By early September the U.N. forces had succeeded in stabilizing the front along the Naktong river behind which had been built up sufficient forces to launch an offensive. An amphibious assault at Inchon was staged on Sept. 15. This threat to the principal communications to the north plus the strength of the attack along the Naktong crumbled the North Korean army. Following the retreating Communists, the United Nations forces crossed the 38th parallel into North Korea and in early November were approaching the Manchurian frontier along the Yalu river.

During this second phase of the Korean war, other United Nations troops joined the U.S. and South Korean forces. Among the first to arrive was a British brigade, the first of two, and a Turkish brigade. A Filipino battalion, as well as units of French, Dutch, Belgians, Greeks, Thailanders and Canadians also went to Korea. U.S. forces at this time included the 7th infantry division from Japan, plus the 2nd and 3rd infantry and the 1st marine divisions, the 187th regimental combat team (airborne) and other units of regimental and battalion strength from the United States, Hawaii and Puerto Rico.

The third phase of the Korean war started in November when United Nations forces launched an offensive aimed for the Manchurian border and an elimination of all opposition. Advancing with little opposition from the North Koreans, the U.N. forces were counterattacked by troops identified as Chinese Communists. By the end of November the Chinese were committed in a counteroffensive and the outnumbered United Nations forces were withdrawn to the 38th parallel. This withdrawal included an amphibious evacuation from the port of Hungnam after the 10th corps was cut off from the 8th army. At the end of 1950 the opposing forces were drawn up approximately along the 38th parallel.

Military observers noted the following facts in the Korean war. The training of the satellite Communist troops—both North Korean and Chinese—was good, with a strong emphasis on guerilla and infiltration tactics. The strategy was similar to that used in the civil war in China—sudden attacks that faded away into the hills if encountering too heavy opposition. The

leadership of the Communist forces was excellent and showed an ability to take advantage of any weakness and to capitalize on terrain and geographic features. Soviet equipment stood up well under adverse conditions. Such equipment included a submachine gun with a drum-type magazine and high rate of fire, a 120-mm. mortar, jeeps and anti-tank guns. The T-34 tank had the field to itself until the U.S. General Patton tank with its 90-mm. gun arrived. (See KOREAN WAR.)

**The North Atlantic Army.**—Agreement was finally reached in 1950 among the powers of the Atlantic area over the details of establishing an international army for defense of western Europe. This followed the creation in 1948 of the western European union with its five-power defense pact for 50 years, and the signing in 1949 of the 12-nation North Atlantic treaty. While all of the Atlantic nations passed greatly augmented defense budgets in 1950, agreement on the individual contributions and the composition of the army was not reached until late in the year. Even then the rearmament of western Germany continued to be a controversial subject among the North Atlantic treaty powers, and a final solution concerning western Germany was not reached in 1950.

A three-year goal was laid out for the North Atlantic army. The following table gives a general indication of the goal for contributions by nations to the troops to be stationed in western Europe by 1953.

Country	Strength in Europe in 1950	Goal
France	5 divisions	25 divisions
Italy	8	18
United States	2	10
Benelux	2	9
United Kingdom	2	7
Total	19	69

To support these units the United States appropriated \$6,000,000,000 in 1950 for equipment to be sent to the pact nations. Britain planned to spend more than \$9,000,000,000 over a period of two years in developing and equipping its forces and providing certain equipment for other countries, while France planned on an outlay of nearly \$6,000,000,000 for defense in the next three years. (See also NORTH ATLANTIC COMMUNITY.)

The major changes in the disposition of the armies of the world during 1950 resulted from the Korean war. Nearly all of the U.S. forces of occupation in Japan were sent to Korea, while most of the regular army troops in the United States were also sent to the far east. Within the United States the troops being sent overseas were replaced by conscripts and the activation of four national guard divisions. France continued to send additional troops, mostly colonials, to Indochina. At the same time a gradual build-up of strength commenced among the North Atlantic treaty nations. There was little change in the disposition of the soviet and satellite armies.

**United States.**—At the beginning of 1950 the United States army faced an economy program, by which the number of troops would be reduced from 677,000 to 630,000. At this time about 20% of the troop strength of the army was allocated to housekeeping duties normally performed by civilian employees who had been dismissed in the economy drive. Consequently, with the outbreak of war in Korea the army had only about 596,000 men.

With the bulk of the regular army committed in Korea, the trend was completely reversed. The rate of military appropriations indicates graphically the development of plans for U.S. rearmament. The appropriation for the army for the fiscal year 1950 was \$4,407,000,000. With economy in mind the initial appropriation for the fiscal year 1951 (commencing July 1, 1950) called for \$4,018,000,000, a reduction of \$389,000,000. The over-all defense appropriation for this period was \$13,000,-

LIEUT. GEN. W. L. WALKER (centre), commanding general of the U.S. 8th army in Korea, planning operations with his joint chiefs of staff in July 1950. Gen. Walker was killed in a motor crash north of Seoul on Dec. 23

000,000. However, during 1950 congress passed two supplemental defense appropriations—the first for \$11,000,000,000 and the second for \$16,000,000,000, bringing defense appropriations to more than \$42,000,000,000 or three times the original figure by the end of the calendar year. Of this amount approximately half was for the army and provided for a strength of 1,263,000 men.

At the outbreak of the Korean war in June 1950 the U.S. army had only ten active divisions. Of these four were on occupation duty in Japan, one was in Germany and the balance were in the United States. Two of the divisions in the U.S., the 2nd and 3rd infantry, were sent to Korea and four national guard divisions—the 28th (Pennsylvania), 40th (California), 43rd (Connecticut, Rhode Island, Vermont) and 45th (Oklahoma)—were called to active duty. In addition the 196th (South Dakota) and 278th (Tennessee) regimental combat teams were called up. These units were to be brought to full strength by integration of draftees. Some nondivisional national guard units were activated to bolster regular army divisions and replace units sent overseas. Strength of the national guard at the start of the Korean conflict was 325,976 and included 27 divisions and 20 regimental combat teams. At that time the organized reserve had a strength of 185,000 and the volunteer reserve 337,000.

By the end of 1950 more than 200,000 men had been inducted into the army under selective service, bringing over-all ground strength to nearly 1,000,000. Plans called for the equivalent of 24 divisions to be organized by June 1951.

**Disposition.**—Approximately half the U.S. troops, 314,000, were in the United States during the first half of 1950, with about 100,000 in Europe and 150,000 in the Pacific. At the end of the year U.S. troop strength in the Pacific was considerably greater, with that in Europe increasing only slightly.

Steps were taken to transform the occupation forces in Germany into a component part of the Atlantic pact army. The U.S. 7th army was reactivated with headquarters in Stuttgart. Combat forces initially assigned to this army included the U.S. 1st infantry division and constabulary units which were slated to be reorganized into an armoured division.

**Training.**—The United States army commenced to reactivate

posts and to modernize training areas necessary to handle an army of two to three times the size of the regular army in 1950. Initial plans called for induction of about 80,000 men a month during the early part of 1951.

During 1950 three major training exercises were conducted:

In February "Sweetbriar" was held in Alaska jointly with the Canadians to test arctic equipment and techniques. About 53,000 troops participated in a mechanized march across difficult Alaska terrain to attack an airstrip held by an "aggressor" force. The U.S. 14th regimental combat team and elements of the Princess Patricia Canadian light infantry, plus some air-borne troops, participated.

In March "Portex" was the largest peacetime amphibious air-borne joint operation held to date. With approximately 80,000 U.S. army, navy, marine and air force personnel participating, this exercise was designed to provide training in joint operations including air-borne amphibious techniques, to test in service new equipment, and to train the defense forces of the Caribbean command.

In May "Swarmers" put to test a purely aerial invasion. Conducted with about 63,000 men and 375 planes, including the bulk of the 11th and 82nd air-borne divisions, this operation tested the practicality of capturing and supporting completely from the air a foothold in enemy-held territory.

Another training problem that received attention in 1950 was that of close support of ground units by tactical aircraft. An army air-support centre was established at Fort Bragg, N.C., to train air-ground teams.

**Equipment.**—New tanks put into production during 1950 included a light tank designated the T-41 weighing 28 tons, mounting a 76-mm. gun, with a speed of 35 m.p.h. The T-41 was stated to be superior to anything in its class, including the M-24 light tank which was thinly armoured and mounted a 75-mm. gun. An improved medium tank designated M-47 was also put into production. A development of the General Patton, the new tank had similar characteristics, such as a weight of 48 tons, 90-mm. gun and a speed of 33 m.p.h.

A new anti-tank weapon was also produced in 1950, a 105-mm. jeep-mounted recoilless rifle. This weapon was planned for infantry units, to be used with 3.5-in. bazookas and the 75-mm. recoilless rifle against enemy armour. (See also MUNITIONS OF WAR.)

**Great Britain.**—The international crisis forced Great Britain to modify its program for economic recovery and to concentrate on building up its armed forces. A minimum defense expenditure of \$10,000,000,000 spread over 1951, 1952 and 1953 was contemplated. It was estimated that it would cost nearly \$3,000,000,000 alone to re-equip the present army. Military service for men from 18 to 26 was extended from 18 months to two years and service pay was increased by as much as 75% in some ranks.

Under the Atlantic pact agreement Britain was to expand its forces in Germany, and to produce tanks, transport and heavy artillery for the Atlantic pact army.

**Disposition.**—Steps were taken during 1950 to increase the army by 55,000 men. This was to bring the six and one-half divisions overseas to full strength. A new division, the 11th armoured, was moved to Germany, joining the 7th armoured and 2nd infantry which were already in the army of the Rhine. British troop strength of around 50,000 was maintained in the middle east with a concentration in the Suez canal zone plus troops in Eritrea and Cyprus. There was the equivalent of two divisions in Malaya plus about 70,000 police of all types. Strength in Hong Kong was 40,000 men. In Korea the 28th and 29th brigades plus supporting troops, including armour, fought alongside the U.N. forces.

**Equipment.**—The 60-ton Centurian tank, which saw some

service in Korea, was one of the best heavy tanks in the world, along with the soviet Stalin Mark III. However, British production of the Centurian was only slightly more than 100 a year.

**U.S.S.R.**—There was little evidence of change in the over-all strength of the soviet army in 1950. With around 100 divisions being maintained at full strength and another 100 in cadres, the U.S.S.R. was maintaining about 2,500,000 men on active service in the army. Because of a smaller overhead, this number gave the soviets a higher proportion of combat effectives than would normally be the case for this number of men in the army.

The published defense appropriation for 1950 was \$20,000,000,000 or 19% of the total budget, but the total defense expenditures probably ran closer to \$45,000,000,000 because of the soviet system of hidden appropriations.

**Disposition.**—No major changes in disposition of the soviet army took place in 1950. About 30 to 35 divisions were maintained in Germany at full strength of 11,000 for the infantry units. These divisions included six armoured plus some unattached tank regiments. In addition there were six soviet divisions in Hungary and Rumania and an additional two in Austria. The exact number of units in Poland was unknown and it was apparent that a major build-up could take place there relatively unobserved. Bridges in the eastern zone of Germany were strengthened to carry the very heavy Stalin Mark III tanks. Strength maintained in the far east was 650,000 men.

**Training.**—At least one special task force was trained during 1950 in arctic warfare techniques. Large-scale exercises were held in Germany, although tank manoeuvres were believed to

"COOKHOUSE" set up for troops of the British, Danish and Norwegian armies during Operation "Nordic," a mutual training exercise carried out in the British zone of Germany during 1950

be restricted because of the deterioration of equipment. An analysis of the state of training and equipment in the soviet army revealed the following conditions:

1. Maintenance of mechanized equipment and armour was at its lowest ebb since World War II because of an extreme shortage of technicians. It was deduced that soviet industrial expansion had received first priority for technicians and that the army was required to train its own mechanics.

2. There was a shortage of all forms of mechanized equipment. Tanks were old, trucks were scarce and in bad condition, and there was a scarcity of self-propelled guns.

3. Armoured divisions lacked good radio equipment.

4. The physical condition, training and discipline of the troops were excellent.

5. Despite shortcomings the soviet army was an extremely effective fighting force.

**France.**—The length of military service was increased from 18 months to two years as part of the program to expand the army to fulfil France's commitment to the Atlantic pact. Plans called for the expansion of the army in Europe to a total of 10 divisions in 1951 and at least 15 in 1952 and 20 in 1953.

The defense budget totalled \$1,650,000,000. Additional financial support was promised by the United States, as well as arms and equipment.

**Disposition.**—Three French divisions were engaged in occupation duties in Germany and Austria. Four additional divisional cadres were available in France and were to be fully manned in 1951.

Reinforcements were sent from France and North Africa to Indochina during the year. These included an armoured regiment equipped with Sherman tanks and an infantry regiment composed of battalions from the Foreign Legion, Morocco and Senegal. French strength in Indochina mounted to 150,000 of which about one-third were French, one-third colonial and the balance Viêt-Nam. About half of the Viêt-Nam troops were well trained and less than 10,000 were under Viêt-Nam officers, the balance having French officers and noncommissioned officers.

Opposing the French and Viêt-Nam forces in Indochina were 150,000 Viêt-Minh, a large proportion of whom had been armed and trained at the major depot and supply centre of Nanning in southern China. Ho Chi Minh maintained 53 well-armed battalions plus 50 more lightly armed units of battalion strength in the vital Tonkin area, where French communications to Hanoi and Haiphong were harassed.

**Equipment.**—France was heavily dependent on U.S. equipment both in Indochina and in metropolitan France. Production of armoured vehicles was increased but still was well behind needs.

**China.**—Most of the remaining forces of Chiang Kai-shek were concentrated on the island of Formosa, although some guerrilla bands, particularly in southwest China, continued to harass the Communist forces. Chiang's forces numbered about 400,000, although most of these had received only six to eight weeks' training and very few were properly equipped.

Strength of the Communist armies, like that of most Chinese armies, was very indefinite. There were probably about 3,000,000 men in arms, of whom nearly half were in central Manchuria and North Korea. Mobilization was publicly decreed on Dec. 12, 1950, and there were indications that the Communists were apprehensive of a general war in Asia. In addition to the forces in the regular army, there were 2,000,000 in the People's militia.

**Disposition.**—There was a major shift in the disposition of the Chinese armies following the decision by Peking to intervene in the Korean war. The 4th field army, with a strength of more than 500,000 men, and one of the best in fighting quality in China, was shifted from the south to Korea. To fill in the gap left by this movement the 3rd field army moved to cover the

Indochina border and the coast opposite Formosa. The 2nd field army was reported in southwest China and there was some indication that the 1st field army was in central Manchuria.

**Organization.**—The strength of the Chinese divisions was 7,000 to 10,000 men. These were organized into three infantry regiments. The Chinese divisions had few supporting services such as engineers, communications, reconnaissance, etc. Artillery support was limited. Three Chinese divisions were grouped into each army and three armies into each group of armies. A field army usually had several groups of armies.

**Equipment.**—Most small arms were old and of soviet or U.S. origin. The Chinese had field artillery up to 155 mm. There were some U.S. light and medium tanks, plus some soviet small arms and medium tanks.

**Other European Powers.**—**Belgium.**—The army was reorganized to fit into the Atlantic pact force. Three commands were established, one for the pact troops, one for the defense of the national territory and one for maintenance and transport. Plans were made to send a full division to Germany to bolster the Belgian corps, which consisted of two brigades in 1950. Compulsory service was extended from 18 months to two years. Strength of the armed forces was 75,000 but was to be raised to 150,000. The 1950 defense budget of \$163,000,000, approximately 11% of the national budget, was increased to \$250,000,000.

**Bulgaria.**—One of the most advanced of the soviet satellite armies, the Bulgarians were reported to have 195,000 men under arms, although the treaty limit set a top figure of 55,000. The Bulgarian army was well equipped with soviet T-34 tanks. About 3,000 soviet military advisers assisted with the training and organization of the army.

**Czechoslovakia.**—The sovietization of the Czech army was accelerated during 1950. Much emphasis was placed in discarding so-called French theories of defense and adopting so-called soviet theories of the offensive. Most of the schooling, however, was based on the German tactics of armoured wedges and pocket fighting plus the usual soviet theory of mass attack disregarding losses. Army strength was 135,000 equipped with several hundred T-34 tanks.

**Eastern Germany.**—The People's "readiness squads" reached a strength of approximately 60,000 in 1950, but the soviets were faced with many desertions from these units despite their indoctrination and considered them unreliable. These troops were known to be given arms only during training periods. There was still evidence that the soviet plan was to train the officer and enlisted cadres of the People's police to be used as the basis for a greatly expanded German army.

**Hungary.**—Although highly unreliable from the Communist viewpoint, the Hungarian army received considerable soviet equipment in 1950. Measures were taken during the year to increase armament production. Army strength was reported to be well above the allowed treaty maximum of 65,000. Military service was extended from two to three years. (There were approximately 30,000 soviet troops in Hungary.)

**Italy.**—During the year Italy maintained about 100,000 men in the army, plus the 70,000 *carabinieri*. To build up sufficient forces for defense, the 8 existing divisions would be increased to 12 plus 2 armoured brigades. Hindering development of the army was a lack of equipment, which would be forthcoming under the Atlantic pact. The regular defense appropriation totalled \$512,000,000 which would be augmented by \$80,000,000 annually. In addition Italy would produce \$400,000,000 in arms for other pact nations.

**Poland.**—The sovietization of the Polish army neared completion as many new officers were commissioned from the ranks of agricultural and industrial workers and former officers were dismissed as politically unreliable. The draft age was dropped from

21 to 20 and the length of service in the army increased to two years, followed by reserve service until age 50. The army numbered 250,000 men and included 16 infantry divisions.

**Rumania.**—One of the first of the satellite armies to be sovietized, the Rumanian army strength was approximately 200,000, well over the treaty limit of 120,000. In addition there were 30,000 soviet troops.

**Spain.**—Although Spain took steps to modernize its army, including the weeding out of incompetent officers, the calibre of the force did not improve. Plans set into effect in 1950 included training a large number of soldiers and noncommissioned officers to cadre a larger army in event of mobilization. The strength of the army in 1950 was 250,000, organized into 22 divisions, but the mobilization goal was 2,000,000. For everything except small arms, Spain would be dependent on outside help. The existing equipment included artillery from the civil war (1938) and French and German tanks of pre-World War II vintage.

**Sweden.**—A new record defense budget was planned at the end of 1950. This would increase expenditures from 17% to 19.4% of the budget. Full-scale manoeuvres were planned for 1951. The immediately mobilizable strength of the army was 700,000. More than \$2,000,000,000 had been spent on new equipment.

**Turkey.**—Army strength was reduced to 400,000, but combat strength was maintained by economies in manpower. The general staff, command and supply systems were reorganized along U.S. lines, and about 10,000 Turkish military personnel completed courses under U.S. instructors. Approximately one-third of the budget or \$164,000,000 was for defense. During 1950 a brigade was sent to Korea and proved to be effective in combat.

**Yugoslavia.**—The strength of the army was 600,000, organized into 25 divisions. Its training was the best in Europe, but emphasized guerrilla tactics and mountain fighting to compensate for the lack of heavy equipment. Although fairly well equipped with small arms, the army lacked anti-tank guns, mortars, artillery, and heavy weapons. Its armour consisted of a pot-pourri of tanks collected during World War II. Plans called for falling back into the mountains in the event of an attack and conducting a guerrilla campaign with approximately 1,000,000 men.

**Other Powers.**—**Canada.**—An appropriation of \$800,000,000 for defense plus \$300,000,000 for new equipment supported not only the Canadian defense establishment and the expeditionary force to Korea but forces of some of the Atlantic pact nations. The army was maintained at 22,000, and a force of 10,000 was sent to Korea.

**India.**—Although relations with Pakistan improved somewhat, the Kashmir situation continued to strain Indian defenses. Approximately 50% of the budget or \$364,000,000 was allocated for defense.

**Iran.**—Faced with an increasingly tense situation along the soviet border, the Iranian army cancelled all leaves at the end of 1950. Plans called for a defense in depth with the 150,000-man army falling back to the mountains for the main battle.

**Israel.**—During 1950 Israel turned more and more to western Europe for training and equipment, as requests to the United States were refused. Lacking in modern arms, Israel could mobilize 200,000 men in an emergency.

**Pakistan.**—The army was maintained at the same level, while defenses were strengthened. An appropriation of \$152,000,000 was made for defense.

**Art:** see ARCHITECTURE; PAINTING; SCULPTURE; etc.

**Art Exhibitions.** During the summer of 1950 the Philadelphia museum again brought before the public some 250 items from the rich private collections of the vicinity. About 60 collectors were represented and high spots were "The Family" by El Greco from the Pitcairn collection; "José Romero" by Goya from the Tyson collection and "On the Balcony" by Mary Cassatt from the Scott collection. Notable canvases by Paul Cézanne, Vincent Van Gogh and Pablo Picasso were also included.

In the fall the Philadelphia museum celebrated its diamond jubilee with an exhibition called "Masterpieces in America" comprising 102 paintings and 119 drawings covering eight centuries and lent by 70 institutions and private collectors. They ranged all the way from a "Crucifixion" by Fra Angelico to "The Three Musicians" by Pablo Picasso. A feature of the exhibition was "St. Peter Denying Christ" by Rembrandt lent by the Rijksmuseum in Amsterdam. Also included was the only work in the United States by Michelangelo, a red chalk drawing, study for the "Libyan Sibyl" in the Sistine chapel, lent by the Metropolitan museum, New York.

A special event at the National gallery in Washington, D.C., was the showing of 40 paintings lent by C. S. Gulbenkian, of Lisbon, London and Paris. Rembrandt's "Pallas Athena" was outstanding in the group as well as several French pictures of importance: Jean-Honoré Fragonard's "Fête at Rambouillet," Pierre Auguste Renoir's "Portrait of Mme. Monet," Edouard Manet's "Boy with the Cherries" and Edgar Degas's "Self-Portrait."

The Corcoran Gallery of Art in Washington featured "American Processional" to celebrate the 150th anniversary of Washington as the capital. Important events in American history and life from 1492 to 1900 were depicted in paintings, drawings and a few prints. The portrait of Christopher Columbus by Sebastiano del Piombo formed the introductory note to the exhibition. Beginning with the end of the 17th century events were depicted by artists working in America. Just as four rare coloured engravings by Amos Doolittle, done in Dec. 1775, tell the story of the battles of Lexington and Concord, so original drawings by Alfred R. Woud give us on-the-spot reporting of leading battles of the Civil War. Many important personages as well as scenes from daily life were recorded in paintings by the leading artists of the day.

Edvard Munch, Norwegian expressionist, was featured in an exhibition divided between the Fogg museum at Harvard university, Cambridge, Mass., and the Institute of Contemporary Art, Boston. Munch lived a good deal in Paris between 1885 and 1892, and was a leader in the modern art movement.

An outstanding exhibition, the "Art of Greater India," brought to the Los Angeles County museum leading examples of Indian sculpture as well as illuminated miniatures of the Mogul school.

New York's Museum of Modern Art did three notable retrospective exhibitions of the work of three highly diversified artists. The first was Paul Klee, the fanciful and highly imaginative Swiss artist who has had such an influence on contemporary art. Another was Charles Demuth, sensitive American artist, facile water colourist, who not only did crisp flower and fruit still lifes but also telling illustrations for Emil Zola's *Nana* and Henry James's *The Turn of the Screw*. Finally, it gathered from collectors in Paris and in the United States a comprehensive survey of the painting of Chaim Soutine, colourful French expressionist.

During the summer seven American artists received international recognition by inclusion in the 25th Biennial in Venice. A whole gallery was devoted to the work of John Marin, dean of American water colourists, while a group showing was shared by six *avant garde* painters: Arshile Gorky, William de Kooning,

"WOMAN CUTTING BREAD," by Abraham Rattner, a 1950 purchase by the Metropolitan Museum of Art and part of "Twentieth-Century Painters," a retrospective exhibit of U.S. paintings, drawings and prints, 1900-50, drawn from the collections of the museum

Jackson Pollock, Hyman Bloom, Lee Gatch and Rico Le Brun.

James Johnson Sweeney, noted writer and art critic, was chosen as a one-man jury to select the Biennial exhibition for the Virginia Museum of Fine Arts. Considerable furor was aroused by the inclusion of Hyman Bloom's "Female Corpse."

Carnegie institute in Pittsburgh resumed its famous International exhibition after a lapse of 11 years. The jury was made up of Marcel Gromaire (Paris), Sir Gerald Kelly (London), American artists Charles Burchfield and Franklin Watkins and retiring Carnegie director, Homer Saint-Gaudens. First prize of \$2,000 went to Jacques Villon (French), for "The Thresher," second prize of \$1,000 went to Lyonel Feininger for "Houses by the River" and third prize of \$800 to Priscilla Robert's "Self-Portrait."

The Art Students league in New York celebrated their 75th anniversary with an exhibition made up of the work of leading alumni and teachers of both past and present and held the show on the premises of the National academy from which they had seceded to form their own school.

Andover (Mass.) reviewed the work of 25 art schools at the Addison gallery, Phillips Andover. This nation-wide survey indicated that American art students have great technical ability and are fully aware of progressive art trends prominent in the world today.

New York's Metropolitan museum put on a handsome sampling of its American paintings from the time of John Singer Sargent's frothy but deftly painted "Wyndham Sisters," Winslow Homer's vigorous "Gulf Stream," John Sloan's atmospheric "Dust Storm" down to a fair cross-section of work by contemporary artists. This was a curtain raiser for their first juried exhibition, which opened in December, called "American Painting Today." Selected by five regional juries and later sifted down by a national jury, the exhibition included 307 pictures. First prize (\$3,500) went to Karl Knaths for "Basket Bouquet," second prize (\$2,000) to Rico Le Brun for "Centurion's Horse," third prize

(\$1,500) to Yasuo Kuniyoshi for "Fish Kite" and fourth prize (\$1,000) to Joseph Husch for "Nine Men."

The *Art News* staged the first National Amateur competition and 1,866 entries were sent in from 46 states. Two gold medals went to Leslie A. Goss of Colorado Springs and Maurice H. Bisharat of Torrington, Conn. Six silver medals were also offered.

The Whitney Museum of American Art featured a retrospective exhibition of the painting and etchings of 68-year-old American artist Edward Hopper, noted for his clean-cut lighthouses, city scenes and immobile interiors where perfectly organized compositional arrangement is his chief concern.

Rockland, Maine's comparatively new Farnsworth museum featured a group of paintings done at the artists' favourite haunt, Monhegan Island. Robert Henri, Rockwell Kent and George Bellows, early admirers of this rocky island off the coast of Maine, were succeeded by Morris Kantor, Reuben Tam and others of a later day.

The Art Institute of Chicago in the 54th Annual Exhibition by Artists of Chicago and Vicinity gave new Pauline Palmer prizes of \$750 each to Francis Chapin's oil, "Black Bull," and to Abbott Pattison's embarrassingly heavy (two tons) marble "Wingless Victory."

(F. A. Sw.)

**Great Britain and Europe.**—The wealth of French art of more than four centuries seen in London in 1950 was made available by the relaxation of import restrictions. French 19th-century painting was well represented: at Burlington house, by a part of the Burrell collection selected for circulation; by the first comprehensive assembly of Berthe Morisot's paintings (55 in all) to be seen in London; and at several private galleries. The Lefevre gallery opened its new premises in Briton Street, London, with an exhibition of Raoul Dufy's work, followed by one of Edgar Degas's.

At the Tate gallery "Modern Italian Art" was outstanding among exhibitions of contemporary art from overseas. Arranged by the Arts Council of Great Britain, the Italian institute and the Amici di Brera, this offered (with the important exception of the painting of Gino Severini) a fair representation of Italian art as far as concerned two sides of Futurist development: the *scuola metafisica* (Giorgio de Chirico, Carlo Carrà, Amedeo Modigliani, etc.) and the *novecento* group (Arturo Tosi, Mario Sironi, etc.) but stopped short of the more recent *fronte nuova dell' arte*.

The opportunity of studying an aspect of modern American painting was afforded when the Institute of Contemporary Arts held in its new premises an exhibition "Symbolic Realism in American Art 1940-50"—a collection of minutely painted illustrations, surrealist or illusionist in character.

Exhibitions of old masters and antique works of art hardly rivalled those of 1949. Nevertheless "William and Mary and Their Time," to which the king lent three tapestries, and which was the first considerable fruit of the Anglo-Dutch cultural convention, provided an excellent portrait of an age. Rembrandt was the artist chosen by the Edinburgh Festival society for 1950 and 36 paintings were exhibited, including the sumptuous "Family Group" from the Count Anton Ulrich museum, Braunschweig, Ger., later shown in London. In accord with the current romantic mood were Wildenstein's important and revealing exhibition of Rubens' portraits, decorative panels and drawings (many of them unfamiliar) illustrating the diversity of his genius; and the first London exhibition of paintings and drawings by William Blake's contemporary Henry Fuseli. "The Private Collector," organized by the Contemporary Art society at the Tate gallery, and the exhibition before dispersal of part of the private collection of Howard Bliss, were most rewarding and showed the trend of enlightened collectors' taste; interesting also, not least for their historical associations, were the William Hothenstein

and D. S. McColl memorial exhibitions, also at the Tate.

The Royal Academy of 1950, chiefly memorable for variations by Stanley Spencer on the theme of the Resurrection, reflected, in the greater influx of serious works and the dwindling of outworn features, the liberal policy of the new president, Sir Gerald Kelly. The latter's one-man show at the Leicester galleries showed that his scrupulous craftsmanship was hardly paralleled in contemporary art.

The 25th Venice Biennial was the highlight of the year's exhibitions of modern art, coming near to providing a cross-section of the contemporary achievement not only of Europe but of the western world. Twenty-one nations participated, five (Colombia, the Republic of Ireland, Portugal, Brazil and South Africa) for the first time.

In Paris the reorganization of the Petit Palais proceeded apace, and at the Louvre an exhibition of the "Madonna in French Art" was held after the rearrangement of the French paintings. Exhibitions of drawings from the Albertina, Vienna, of Yugoslav mediaeval art, of the first of the work of Eva Gonzales (a neglected Impressionist) and of paintings by the Mexican Rufino Tamayo, were among those held in France. (See also ART SALES; ETCHING; MUSEUMS; PAINTING; SCULPTURE.) (N. A. D. W.)

**Arthritis.** During 1950 cortisone (17 hydroxy-11-dehydrocorticosterone—Kendall's adreno-cortical Compound E) and ACTH (adrenocorticotrophic hormone of the anterior pituitary) consistently demonstrated an antirheumatic effect (benefit) on many types of arthritis, especially those of inflammatory nature and particularly rheumatoid arthritis.

New developments in the manufacture of cortisone and ACTH during the year resulted in a substantially increased supply at a considerably lower cost. The practical application of these hormones in the management of rheumatic patients was accomplished in some acute rheumatic illnesses such as rheumatic fever and gouty arthritis. Their use in chronic illnesses such as rheumatoid arthritis was still problematical. It was found that this disease is not eliminated by a short period of administration of cortisone or ACTH, although it may be completely suppressed. When the hormone is discontinued the disease almost invariably recurs and usually presents the same problems that existed before treatment. In an effort to obtain more permanent benefits, trials of repeated short periods of hormone treatment, separated by periods without the hormone, were made. Such treatment failed to accomplish the objective. Many medicines were used immediately following cortisone or ACTH with the hope that they would sustain the benefits of the hormone, but none were successful. Studies of long periods of continuous cortisone or ACTH therapy for rheumatoid arthritis were being made. The results indicated that in some patients it seemed reasonable and possibly desirable; in others it was impractical because effects of the hormone other than the antirheumatic effect sometimes produce complications and make the treatment unsafe. These other effects include hormonal and metabolic changes which may result in diabetic changes, oedema, hypertension, central nervous system changes which result in depression or excitement, and bleeding tendencies which may cause severe haemorrhage. Also, long use of the hormones may decrease the functioning of the patient's adrenal or pituitary glands. This may cause undesirable glandular changes when the hormone is discontinued, resulting in withdrawal symptoms of weakness, stiffness and depression; this is in addition to the worsening of the arthritis which usually occurs even after long use of the hormones. These complications are important factors which make prolonged use of cortisone and ACTH difficult and sometimes impossible.

Cortisone is effective by mouth and in general has the same effects as when given by intramuscular injection, as formerly re-

quired. Tablets of cortisone became available during the year, making treatment simplified and less expensive.

A major difficulty in the use of ACTH was the requirement of injections of this hormone several times each day; this was necessary because of the short period of effectiveness of available preparations. Efforts were being made to develop a form of this hormone that could be slowly and uniformly absorbed so as to require injection only every 48 or 72 hours, and thus facilitate its use in ambulatory patients. The developments were encouraging.

Many steroids were produced chemically similar to cortisone. These were intensively studied, and investigation was continued with the hope of developing an effective substitute for cortisone, a substitute which would have little or no complicating side effects. An outstanding example of these drugs was pregnenolone. Reports concerning its effectiveness varied widely. It seemed to have much less antirheumatic effect than cortisone. Many investigators found this drug to be of little or no value in the majority of trials, but because it had little toxicity, efforts were continued to determine if this steroid could be made more effective.

Intensive research into the cause and mechanism of rheumatoid arthritis, and in ways to improve physical measures of treatment, pain-relieving drugs and other well established forms of treatment was also being carried forward. (See also BIOCHEMISTRY; ENDOCRINOLOGY.)

**Art Sales.** The art sales season which closed in the early summer of 1950 brought a somewhat lower total than the previous season. This was attributed to the fact that art objects had become more scarce. New York's leading auction house, the Parke-Bernet galleries, moved to spacious new quarters. Their season's total, \$4,537,142, was a little more than \$1,000,000 under the total of the year before, a fact which was partly the result of the disruption caused by moving. They reported, however, a 30% increase in attendance. Raphael's "Peruzzi Madonna" sold for \$27,000, the highest price of the season. A Gilbert Stuart full-length portrait of George Washington brought \$17,500, and Mme. Vigée-Lebrun's "Madame Elizabeth of France," \$13,250. Other top prices for paintings were \$12,500 paid for Frans Hals's "Jouker Ramp," a similar price for "Le Grand Nu" by Amedeo Modigliani and \$5,500 for Henri Matisse's "Woman in Green."

Furniture sold at good prices, \$14,500 being paid for a Louis XVI Beauvais tapestry suite made for Marie Antoinette. A pair of Louis XV acajou commodes went for \$7,100. The Marsden Perry set of Apostle spoons brought \$5,000.

Among the prints in the Albert E. McVitty sale Rembrandt's "St. Francis beneath a Tree Praying" sold for \$3,100 and "Jan Cornelis Sylvius Preacher" \$2,600.

The Plaza galleries announced a season's total of \$1,178,870.70, about \$150,000 under the previous year. Their most interesting sale was the collection of Robert (Believe-It-Or-Not) Ripley in which Makoffsky's "Russian Wedding Feast" brought \$2,200.

Kende galleries did business amounting to \$900,000, also under the previous season's figure. Highest painting prices were \$5,500 paid for Anthony Van Dyck's "Duchess of Croy" (Andrassy collection) and \$3,500 for Jan Steen's "The Quack Doctor" (N. M. Friberg collection).

Auctions in London were lively but not spectacular. Christie sold the collection of Mrs. Isabella Frances Weston for £25,025 of which £7,560 was paid for "Grand Canal, Venice" by Francesco Guardi. At the sale of the Claude Lucas collection of drawings £2,415 was paid for "Man on Horseback with Falcon" attributed to Pisanello and £1,890 for "Mule and Peasant" by Pieter Bruegel, the Elder.

The sale ordered by the Wanchope Settlement trust came to £18,490 with £6,510 for a landscape attributed to Rembrandt. Mrs. Warwick Bryant sold a pair of views of Dresden by Bernardo Bellotto, mid-18th century, for £3,990. Sir Joshua Reynolds' "Miss Charlotte Fish" (Sir John Fitzgerald collection) went for £1,522. The collection of Col. H. A. Clowes brought £32,447 with top price of £6,195 paid for the "Coast near Scheveningen" by Jacob van Ruysdael.

Sotheby auctioned a pair of portraits by Francis Cotes of Sir Robert and Lady Cunliffe (late Sir Foster Cunliffe collection) for £1,320. Lieut. Col. the Master of Belhaven sold "Prince William of Orange" by Albert Cuyp for £1,250. A Jacob Ochtervelt "Interior" brought £1,000. A standing salt of rock crystal with silver-gilt mounts (1573) sold for £2,400. This was supposed to have been given to Sir Francis Drake by Queen Elizabeth. A rare Worcester porcelain teapot, dated 1772, brought £800.

**Astronomy.** Certain general tendencies in astronomical research were well marked during the year 1950; theoretical investigators were active in problems concerned with the recently discovered polarization of material between the stars; the possible evolution of stars from interstellar dust clouds and the motions of interstellar clouds also formed the subject of extensive theoretical research. The young science of radio astronomy was very active, with the discovery of new radio stars and large-scale extensions in the use of radio telescopes. The substitution of photoelectric methods of observation for those employing the photographic plate proceeded at an accelerated rate. A lecture by W. Baade of Mount Wilson observatory, California, at a symposium at the University of Michigan, Ann Arbor, in June summarized the present knowledge concerning the structure of galaxies, and indicated the most profitable directions for future investigations in this field.

**Solar System.**—R. S. Richardson and M. Schwarzschild at the Mount Wilson observatory measured the amount of motion in the line of sight of the small granules observed in profusion over the surface of the sun. Velocities in the line of sight of the order of 3 mi. per second were measured for areas of the order of 100 mi. in diameter.

An annual fluctuation in the length of the day was established by the work of H. F. Finch at the Greenwich Royal observatory, England. Investigation of the period of rotation of the earth was carried on by means of quartz clocks; the latter undergo an acceleration of rate in the autumn and a retardation in the spring. The accumulative effect in time is approximately 0.06 sec., and confirms the earlier results of N. Stoyko. The principal features

of the fluctuation were shown independently by W. Uhink at Potsdam, Ger. An attempt was made in 1949 by F. H. van den Dungen, J. F. Cox and J. van Mieghem to express such a fluctuation in terms of seasonal changes in the distribution of air masses over the earth's surface.

The spectrum of the earth's atmosphere was shown by A. B. Meinel of the Yerkes observatory, Williams Bay, Wis. to contain extremely strong emission features because of the ion OH. Meinel also made the discovery of the entry into the earth's atmosphere of high-speed hydrogen nuclei at the time of the great aurora of Aug. 19-20, 1950.

**The Stars and Nebulae.**—Two new stellar systems belonging to the local group of galaxies were discovered at Palomar observatory, California, by R. G. Harrington and A. G. Wilson. On plates taken with the 48-in. Schmidt camera, more than 200 separate stars could be counted in each system. The systems are of the dwarf variety and are of the order of 650,000 light-years from the earth. Their discovery brought the total known membership of the local system (of which our own galaxy is the largest member) to 16.

The problem of fundamental standards of brightness for stars over a large range in apparent magnitude was investigated by Joel Stebbins, A. E. Whitford and H. L. Johnson of the Mount Wilson, Palomar and Washburn (Madison, Wis.) observatories. By means of photoelectric equipment of high accuracy and sensitivity, the brightness and colours of 102 stars in various selected regions of the sky were determined. It seemed exceedingly unlikely that any future work would appreciably alter these standards, and it was probable that they could be considered fundamental for all problems in stellar astronomy.

**Phenomena for 1951.**—*Eclipses.*—There would be two eclipses in 1951, both of the sun and both annular. On March 7, 1951, the path of an annular eclipse would begin in the South Pacific ocean and end in the Caribbean sea. It would pass over New Zealand and Central America and would be observable in its partial phase in parts of North America, Central and South America. On Sept. 1, 1951, the path of an annular eclipse would pass from the east coast of North America over the Atlantic ocean, parts of Africa, and end on the island of Madagascar. The eclipse would be observable in its partial phase over the eastern part of North America and parts of Europe and Africa. (See also NATIONAL GEOGRAPHIC SOCIETY.)

**Atomic Energy.** Pres. Harry S. Truman's decision to proceed with the development of a hydrogen bomb was the most important event in the field of atomic energy in 1950.

The Korean war (*q.v.*) and the possibility that it might lead to World War III caused the United States to embark upon a great expansion of its atomic energy program. It also stimulated increased activity in the organization of civil defense against atomic attack.

Attempts to reach an agreement on the international control of atomic energy came to a standstill early in 1950.

Other events of importance in the realm of atomic energy during 1950 included the conviction of Klaus Fuchs as an atomic spy and the realization that he had furnished the U.S.S.R. with basic information of the utmost importance; the substantial achievements of the U.S. Atomic Energy commission; the release by the commission of a considerable amount of previously secret infor-

mation on the nature and effects of atomic explosions; the three-power decision by the U.S., Great Britain and Canada to disclose significant data on the construction and operation of low-power nuclear reactors; and the dismissal of Frederic Joliot-Curie from his post as French high commissioner for atomic energy.

**The Hydrogen Bomb.**—More than 20 years before the discovery of uranium fission in 1939, physicists realized that vast amounts of energy could be released by the synthesis of helium from hydrogen. If four atoms of hydrogen were combined into one atom of helium there would be a loss in mass of 0.0286 atomic mass units. This, in accordance with the Einstein equation for the transformation of matter into energy,  $E=mc^2$ , would mean the release of 2,670,000 ev of energy.

During the 1930s astronomers came to the conclusion that hydrogen was undoubtedly the "atomic fuel" of the sun and stars, and equations were written by Hans Bethe for the probable nuclear reactions occurring in the celestial bodies. But scientists despaired of duplicating these processes on earth since apparently they could take place only at the high temperatures existing in the interiors of the sun and stars. Because of their dependence on such temperatures they were named "thermonuclear reactions."

However, with the discovery of uranium fission a new possibility developed. Even before an atomic bomb had been achieved, J. Robert Oppenheimer and his associates at the Los Alamos laboratory recognized that the explosion of a uranium bomb would generate a temperature at which thermonuclear reactions might take place. It occurred to them that it might be possible to build a hydrogen bomb which would employ an atomic bomb as the fuse to detonate it.

After the end of World War II, preliminary studies were instituted at the Los Alamos laboratory to explore these possibilities. It was realized that it was not feasible to employ ordinary hydrogen, which is a mixture of 98% lightweight hydrogen and 2% deuterium or double-weight hydrogen. It did appear, however, that a hydrogen bomb could be made with deuterium; or with tritium or triple-weight hydrogen; or with a combination of deuterium and tritium.

Deuterium can be separated from ordinary hydrogen by chemical means. However, tritium occurs in nature only in infinitesimal amounts. But it was known that tritium could be produced by subjecting lithium to neutron bombardment in a nuclear reactor or uranium pile.

It was estimated that a given weight of tritium would release seven times as much atomic energy as would an equal weight of plutonium. One kilogram (2.2 lb.) of tritium would be the equivalent in explosive violence to 140,000 tons of T.N.T. It will be recalled that the atomic bomb which devastated Hiroshima was the equivalent of 20,000 tons of T.N.T.

Unlike the uranium or plutonium bomb, the hydrogen bomb would not be limited in size to any critical mass. Theoretically it appeared possible to produce a hydrogen bomb 1,000 times as powerful as an atomic bomb. Cost of production and difficulties of transportation appeared to be the only limiting factors.

A further possibility was the construction of a hydrogen bomb surrounded by some material which would be rendered highly radioactive by the neutrons released in the bomb explosion. The substance most suitable for this purpose appeared to be cobalt, so that the proposed weapon was designated a "hydrogen-cobalt bomb."

It was suggested that such a bomb exploded at sea would release into the air vast amounts of radioactive dust which would be carried landward by prevailing winds to devastate vast areas. In fact, a number of eminent scientists, including Albert Einstein, maintained that such explosions might render the entire earth lifeless. Other scientists doubted this possibility.

On Jan. 31, 1950, President Truman announced that he had

directed the U.S. Atomic Energy commission to continue its work on all forms of atomic weapons including the so-called hydrogen or super bomb. The president's announcement met with immediate approval from Republican as well as Democratic members of Congress.

On Nov. 28, 1950, the U.S. Atomic Energy commission announced that a new plant, to be known as the Savannah River plant, would be built on a 250,000-ac. site in Aiken and Barnwell counties, South Carolina, on the Savannah river. It was generally understood that the primary purpose of this plant would be the production of material for the hydrogen bomb.

A contract was made with E. I. du Pont de Nemours & Co., which had built the original plutonium plants at Hanford, Wash., during World War II, to assume the design, construction and operation of the new plant for which Congress had already appropriated \$260,000,000.

**Atomic Submarine.**—The Westinghouse Electric corporation and the General Electric company were engaged in 1950, under contracts with the U.S. Atomic Energy commission, on the design of atomic power plants for use in submarines. Westinghouse was working on a "ship thermal reactor," a nuclear reactor utilizing slow neutrons, while General Electric was working on a "ship intermediate reactor" employing neutrons of higher speed.

It was estimated that an atomic-powered submarine would cost about \$40,000,000, or four times as much as the present type. It would, however, have an enormously greater cruising range and would be able to carry on full-speed underwater operations for extended periods of time.

**Atomic Aeroplane.**—Early in 1950 a technical advisory board to the Oak Ridge National laboratory, composed of more than 20 aeronautic and nuclear physicists, was organized to accelerate the development of a nuclear power plant for aeroplanes. F. Wheeler Loomis of the University of Illinois was chairman.

**Radiological Warfare.**—It had been realized since 1945 that the fission products formed in a nuclear reactor could be used to manufacture particularly vicious forms of radioactive poison gases or for the preparation of radioactive dusts and sands. These could be released in various ways or fired in artillery shells. The U.S. Atomic Energy commission announced in 1950 that it was continuing its studies of radiological warfare.

**United States Atomic Strength.**—The entire program of the U.S. Atomic Energy commission was accelerated in 1950. Fissionable materials were produced at the highest rate of output and the lowest unit cost on record. Procurement of both foreign and domestic ores was increased and plans were made to expand operations on the Colorado plateau.

Planning and construction were carried on for new weapons tests at the Eniwetok proving grounds in the Pacific.

The U.S. air force disclosed that hundreds of men had been taught in a secret training program how to handle atomic bombs. The U.S. navy announced that bomber planes sufficiently large to carry atomic bombs had made successful test landings on an aircraft carrier.

Gen. J. Lawton Collins, chief of staff of the U.S. army, said that an artillery piece capable of firing atomic weapons and guided missiles with atomic war heads was under development.

As 1950 drew to a close, the United States made plans for a tremendous expansion of its atomic energy facilities in 1951. On Dec. 13, Sen. Brien McMahon outlined to the senate a \$1,050,000,000 program for the development of "new and more effective atomic weapons." This included a \$500,000,000 plant to be built near Paducah, Ky., for the production of uranium 235.

**Korea and the Bomb.**—It was generally conceded at the start of the Korean war that use of atomic bombs would be unwise from both the military and the diplomatic points of view. However, President Truman's answer to a question at a press confer-

ence on Nov. 30, 1950, was construed to mean that use of the bomb was being contemplated.

Although a clarifying statement was issued by the White House, the first report caused alarm among the United Nations delegates at Lake Success, N.Y., and in the capitals of western Europe. This alarm was believed to have been the deciding factor in Prime Minister Clement Attlee's decision on Nov. 30 to fly to Washington, D.C., for a conference with President Truman on the threat to world peace in the far east.

**The Treachery of Klaus Fuchs.**—On March 1, 1950, Klaus Emil Fuchs was sentenced in London's historic criminal court, the Old Bailey, to serve 14 years in prison for having given United States and British atomic secrets to soviet agents. It was believed probable that his treachery enabled the U.S.S.R. to achieve the atomic bomb at least a year earlier than it could otherwise have done.

Fuchs, a German, who joined the Communist party in 1932 had fled to Great Britain in 1933 because of persecution of his family by the nazis. He continued his scientific studies in Great Britain, and was interned as an enemy alien in 1940, but subsequently was released and put to work on the atomic energy project. In 1943 he was sent to the United States with a team of British atomic scientists and became one of the inner circle at the Los Alamos laboratory where the first atomic bomb was designed and built. He returned to England in 1946 to become head of the theoretical physical division of the British atomic energy project at Harwell. He made a second visit to the United States in 1947. On Feb. 3, 1950, Fuchs was arrested by Scotland Yard officers on the basis of information furnished by the U.S. Federal Bureau of Investigation. In a voluntary confession he disclosed that he had started giving atomic secrets to soviet agents almost from the day that he joined the atomic bomb project.

On March 7, Tass, official soviet news agency, stated that Fuchs was unknown to the soviet government and that his confession was a lie.

**The Soviet Spy Ring.**—On May 23, 1950, the FBI arrested Harry Gold, 39, a biochemist, of Philadelphia, Pa., charging that he had been the messenger between Fuchs and two soviet espionage agents no longer in the U.S. Gold pleaded guilty and furnished information which aided in the apprehension of other members of the ring. On Dec. 9 he was sentenced to serve 30 years in a federal penitentiary.

**International Deliberations.**—Attempts to reach an international agreement on the control of atomic energy came to an abrupt halt on Jan. 19, 1950, when soviet Deputy Foreign Minister Jacob A. Malik walked out of a conference of representatives of the Big Five and Canada at Lake Success. This action followed the pattern set on Jan. 10 when the soviet delegation marched out of the Security council meeting, stating that it would not take part in any discussion so long as the delegates of nationalist China were permitted to remain.

Following President Truman's announcement of the decision to proceed with the hydrogen bomb, a strong feeling manifested itself in both the United States and Great Britain that another attempt ought to be made to reach an understanding with the U.S.S.R. Among those who urged this were Sen. Brien McMahon, chairman of the joint congressional committee on atomic energy; Sen. Millard E. Tydings, chairman of the senate's armed services committee; and Winston Churchill, former prime minister of Great Britain.

But President Truman and Secretary of State Dean Acheson held that any new attempt to approach the U.S.S.R. would be useless.

Addressing the general assembly of the United Nations at Lake Success on Oct. 24, President Truman suggested that a new approach might be made to disarmament and the control of

Above, left: CONTROL ROOM of the nuclear reactor at Brookhaven National laboratory, Upton, N.Y., the largest atomic pile in the United States at the start of its operations in Aug. 1950. The purpose of the reactor was to produce neutrons for research in biology, medicine and nuclear physics

Above right: BRITISH WOMEN demonstrating atomic defense techniques at Winchester, Eng., in 1950, as part of a program organized by the Hampshire Civil Defense corps. They are shown using Geiger counters in an area supposedly contaminated by radioactivity

Right: MODEL of a laboratory-clinic to be erected at Hiroshima, Japan, for follow-up studies by the U.S. Atomic Bomb Casualty commission on the long-range effects of atomic bomb blasts on several generations of descendants of survivors

Below: HOUSING for the largest privately operated centre for nuclear studies, radiobiology and metallurgy, under construction at The University of Chicago in 1950. At right is a corner of the Stagg field enclosure, site of the first atomic chain reaction

atomic energy by merging the United Nations Atomic Energy commission and the Commission for Conventional Armaments into a single disarmament commission.

Since the U.S.S.R. had been known to favour such a course, hopes were raised that progress might be resumed. However, on Nov. 3, when the Political and Security committee of the general assembly approved a resolution calling on all nations to accept the majority plan for the control of atomic energy and to agree to a reduction in armaments, the vote was 47 to 5 with the soviet bloc casting the negative votes.

**The Stockholm Petition.**—Following a meeting in March 1950 of the world peace congress of the Partisans of Peace in Stockholm, Swed., a campaign was launched to obtain signatures to a "peace petition" demanding the outlawing of the atomic bomb. The whole movement was plainly dominated by the U.S.S.R. and the pattern was set by *Pravda*, which declared that anyone who refused to sign the petition exposed himself as an "accomplice and henchman of the warmongers."

By August it was claimed that 273,470,566 persons had signed the petition. It was significant that while 115,275,000 signers were reported from the U.S.S.R., only 790,277 signers were claimed in Great Britain and 1,350,000 in the U.S.

**U.S. Atomic Energy Commission.**—Lewis L. Strauss resigned from the U.S. Atomic Energy commission on Feb. 7, 1950. The resignation of David E. Lilienthal, first chairman of the commission, became effective on Feb. 15 and President Truman appointed Thomas E. Murray, 58, an industrial engineer of New York city, to the commission.

In June President Truman renominated the four men then serving on the commission for new terms as follows: Sumner T. Pike, four years; Gordon Dean, three years; Murray, two years; and Henry DeWolf Smyth, one year. Congress subsequently confirmed these nominations and on July 11 the president appointed Dean chairman of the commission.

On Aug. 11 President Truman nominated T. Keith Glennan, 44, president of the Case Institute of Technology, Cleveland, O., as the fifth member of the commission.

Carroll L. Wilson, general manager of the commission, submitted his resignation on Aug. 8, and on Oct. 25 the commission appointed Marion W. Boyer, vice-president of Esso Standard Oil company, to the post of general manager.

**Effects of Atomic Weapons.**—The basic information needed for the intelligent planning of civil defense against atomic attack was set forth in a book entitled *The Effects of Atomic Weapons* issued by the U.S. defense department and the Atomic Energy commission on Aug. 12, 1950. It had been prepared under the direction of the Los Alamos laboratory by a board of editors with J. O. Hirschfelder as chairman. The book explains in detail many things about the nature of an atomic explosion and its effects which had previously been disclosed only in broad general terms.

It describes in detail the four main sources of damage in an atomic explosion, namely, (1) the air blast or shock wave, (2) the heat wave or thermal radiation, (3) the radioactive rays or nuclear radiations and (4) the residual radioactivity of the fission fragments.

The chief damage is done by the air blast or shock wave and this is greatest when the bomb is exploded in air at an altitude of about 2,000 ft. Under such circumstances the average limit of general structural damage is roughly two miles in all directions from "ground zero," the point directly under the exploding bomb.

Statistics analyzed by the U.S. Atomic Energy commission indicate that at Hiroshima and Nagasaki, 50% to 60% of the deaths were due to blast effects and flame burns, 20% to 30% to flash burns and 15% to 20% to radioactivity. It must be realized,

however, that many whose deaths were attributed to the more obvious causes also received lethal doses of radioactivity.

Flame burns, not to be confused with flash burns, are the result of fires started by broken gas mains, short-circuited electric lines and the like.

**Civil Defense.**—There was mounting interest in civil defense in the United States in 1950. It was realized that civil defense, a mere side issue in the U.S. in World War II, was at the very core of preparations for the possibility of World War III.

It came as a shock to many persons to learn that the basic purpose of civil defense was not the prevention of civilian casualties but the maintenance of industrial production without which the armed forces of the nation could not continue to exist.

The ideal defense against the atomic bomb would be to disperse the big cities and industrial centres of the nation so that there was no target left sufficiently attractive to justify the expense of an atomic attack. This, however, would cost hundreds of billions of dollars and would require years to accomplish.

It was felt, however, that as possible must be done to disperse new industrial facilities and to create fire lanes or "green belts" to halt the spread of fires.

It was obvious that no city hit by an atomic bomb could take care of itself. It was necessary, therefore, to organize civil defense on a state-wide or even interstate basis, designating the so-called "target areas" and the "assistance areas" which would be prepared to render first aid to them if they were hit.

There were no atomic bomb shelters in existence as 1950 drew to a close. A great deal was accomplished, however, in the last six months of the year in the formation of a civil defense organization. State directors of civil defense were appointed in every state but one and considerable progress was made in the creation of local units.

On Sept. 8 the national security resources board submitted

"BACK WHERE WE STARTED," cartoon by Costello which appeared in the *Knickerbocker News* (Albany, N.Y.) during 1950

a plan to President Truman for the civil defense of the United States. On Dec. 1 President Truman created the federal Civil Defense administration as a branch of his executive office and appointed former Gov. Millard F. Caldwell, Jr., of Florida to head it.

On Dec. 4 bills were introduced into congress embodying the plan for civil defense prepared by the national security resources board. This called for the expenditure of \$3,100,000,000 over a period of three years. The federal government would supply 54% of this fund, with state and local communities furnishing the balance. The largest expenditure envisioned was that of \$2,250,000,000 for communal-type air-raid shelters. In addition to shelters, the plan embraced the need for fire services, sanitation, panic prevention and control, civilian evacuations, dissemination of warnings, relief, emergency feeding and housing, emergency medical care, rehabilitation, and restoration of essential utilities, communications, transportation and the like.

**Reactor Data Released.**—The U.S., Great Britain and Canada agreed in Nov. 1950 to make public data relating to the construction and operation of low-power nuclear reactors. It was believed that the release of this information, which represented a major change in policy for the governments involved, would accelerate atomic research and the development of peacetime uses of atomic energy.

**Atomic Research.**—The largest and most powerful nuclear reactor designed exclusively for research purposes went into operation at the Brookhaven National laboratory on Aug. 22, 1950. It was an air-cooled graphite-uranium pile that cost \$25,000,000 and took three years to build.

Columbia university, New York city, became the possessor of the world's most powerful atom smasher when its new synchro-cyclotron began operation on May 2 at Irvington-on-Hudson. It developed energies of 400,000,000 ev.

However, the Radiations laboratory of the University of California, Berkeley, announced that the halfway mark had been reached in the construction of the so-called bevatron, a synchro-cyclotron that would develop energies of 6,000,000,000 ev. A similar but smaller atom smasher, designed to produce 3,000,000,000 ev, was being constructed at the Brookhaven National laboratory.

The General Electric company built a new type of atom smasher, a nonferromagnetic synchrotron which was expected to produce X-rays with energies of 1,000,000,000 ev.

The University of Michigan, Ann Arbor, opened a drive on Oct. 2 to raise \$6,500,000 for its so-called Phoenix project, a research centre devoted to atomic studies.

The U.S. Atomic Energy commission on Oct. 28 granted the North Carolina State college, Raleigh, N.C., permission to build a low-power nuclear reactor. Known as a "water boiler," it would produce less than a gram of plutonium a year. This would be the first nongovernmental reactor in the United States.

**Advances in Great Britain.**—The British began construction of a sixth atomic energy establishment at Aldermaston, near Reading, 45 mi. from London, in April 1950. At the time four atomic energy stations were in operation and a fifth under construction.

Sir John Cockcroft, director of the British Atomic Energy Research establishment, disclosed that studies on atomic power plants for ships and for industrial purposes were under way and that he believed both goals could be achieved in about eight years. The Harwell station had a 180,000,000-ev cyclotron, the largest one in Europe.

**Canadian Atomic Energy Project.**—W. Bennett Lewis, director of the Division of Atomic Energy Research, National Research Council of Canada, disclosed that a high-power nuclear reactor using heavy water as a moderator and developing 10,000

kw. of heat, was in successful operation during 1950. The reactor had the highest neutron flux density of any reactor in operation at the time. It had produced some plutonium but its chief use was for research and the production of radioactive isotopes. Thirty-two isotopes were being produced at the close of 1950.

The Canadian program, according to Lewis, called for the building of a series of reactors, culminating in one that would generate power for industrial purposes.

**Norwegian Institute.**—Norway created an institute for atomic energy studies in 1950 with Gunnar Randers as chairman. Construction was started on a nuclear reactor using heavy water as a moderator and developing energies of 100 kw. The reactor would be located at Kjeller, 15 mi. from Oslo, near the existing laboratories of the Defense Research establishment.

Other instruments for nuclear research were being built both for the institute and for Norwegian universities. These included a 50,000,000-ev betatron. Randers pointed out that all the Norwegian equipment was modest by U.S. standards but designed for precise scientific investigations.

**Dismissal of Joliot-Curie.**—Addressing the national congress of the Communist party in France on April 5, 1950, Frédéric Joliot-Curie, French high commissioner for atomic energy, stated that a "true progressive scientist" would never give any of his knowledge for war against the Soviet Union. On April 28 he was dismissed from his post as commissioner.

The French atomic energy commission had a nuclear reactor using heavy water as a moderator which went into operation on Dec. 15, 1948. The first sample of plutonium was obtained from the reactor on Nov. 20, 1949. Radioactive isotopes were also being produced with the reactor.

**German Uranium Mines.**—The British element of the Allied High commission for Germany issued a report on Aug. 23, 1950, declaring that the Russians were operating the uranium mines in the soviet zone of Germany at a "frantic pace." The report stated that about 300,000 men and women were employed in the mines and were being driven to the limit of their physical powers. The operations were under the direction of a soviet organization known as Wismuth Aktien Gesellschaft. (See also METALLURGY; PHYSICS; URANIUM.)

**Atom Smashers:** see ATOMIC ENERGY.

**Attlee, Clement Richard** (1883– ), British prime minister, was born in London on Jan. 3. He was educated at Haileybury and University college, Oxford. After a period of legal practice, he was secretary of Toynbee hall, London, and a lecturer at Ruskin college, Oxford. In 1913 he joined the staff of the London School of Economics. During World War I he served in Gallipoli, Mesopotamia and France. He was first Labour mayor of Stepney, London, 1919–20, was elected member of parliament for Limehouse in 1922, and in the second Labour government was chancellor of the duchy of Lancaster and later postmaster general. He was deputy prime minister in the wartime coalition government and became prime minister when the Labour party achieved a majority in July 1945. In the general election of Feb. 23, 1950, the Labour party was confirmed in power with a small majority, and the prime minister was returned for West Walthamstow. After the general election he reformed his ministry. On March 16 he rejected Winston Churchill's demand for a secret session on de-

fense. He had discussions with the United Nations secretary-general, Trygve Lie, in April and May, and in May he also conferred with the U.S. secretary of state, Dean Acheson. During the year, the prime minister broadcast once before the general election and three times on defense. In October he rejected suggestions that there would be a coalition government or an immediate general election. On Oct. 26 he took part in the ceremony to mark the opening of the new house of commons chamber. On Dec. 4 he flew to Washington, D.C., for discussions on defense with Pres. Harry S. Truman.

**Audio-visual Education:** *see* MOTION PICTURES.

**Auriol, Vincent** (1884– ), French statesman, was born on Aug. 27 at Revel, Haute-Garonne. After receiving his degree of doctor of laws at the faculty of law in Toulouse, he practised in that city. In 1909 Auriol became editor in chief of the newspaper, *Le Midi Socialiste*. Entering politics, he was elected to the chamber of deputies as Socialist member for Muret (Haute-Garonne) in 1914 and was constantly re-elected up to the collapse of France in June 1940. Auriol's first cabinet post was in Leon Blum's cabinet in 1936, when he was appointed minister of finance. He was minister of justice in the Camille Chautemps cabinet (1937–38) and held a post in the short-lived Blum cabinet in 1938. Auriol, who was among the 80 French parliamentarians who on July 10, 1940, voted against according full powers to Marshal Henri Philippe Pétain, was imprisoned by Vichy authorities for several months but was later released. In Oct. 1943 he escaped to London where he joined Gen. Charles de Gaulle's movement. He became a member of the consultative assembly set up in Paris after its liberation in Aug. 1944. In Nov. 1945 he was appointed minister of state without portfolio in the De Gaulle government. He was elected president of the French constituent assembly on Jan. 31, 1946. On Jan. 16, 1947, Auriol became the first president under the constitution of the Fourth Republic. In April 1947 he paid an official visit to French West Africa. In May 1949 he visited Algeria. On March 7, 1950, President and Mme. Auriol went to London for a three-day state visit. At a state banquet at Buckingham palace at which King George referred to the old ties uniting France and Great Britain, President Auriol said in reply that the happiness and peace of the peoples of the world largely depended on the resolution of the two nations to act in concert. (*See also* FRANCE.)

**Austin, Warren Robinson** (1877– ), U.S. delegate to the United Nations, was born at Highgate, Vt., on Nov. 12 and was graduated from the University of Vermont at Burlington in 1899. He practised law and became active in Republican politics. Elected U.S. senator from Vermont in 1931 to fill an unexpired term, he was re-elected in 1934 and 1940, but resigned to become acting U.S. representative to the United Nations, by appointment of Pres. Harry S. Truman, June 5, 1946. On Jan. 13, 1947, Austin became U.S. representative at the seat of the United Nations, with the rank of envoy extraordinary and plenipotentiary, and U.S. representative on the Security council. Austin was one of several U.S. leaders to disagree with former Pres. Herbert Hoover's suggestion, early in 1950, that the United Nations proceed without the Communist bloc, which was boycotting the Security council. It was Austin who led the attack against soviet efforts to use the U.N. Security council as a propaganda sounding board after the Russians resumed their seat on the council to take advantage of their turn, in rotation, at the presidency in Aug. 1950. Austin repeatedly opposed soviet delegate Jacob Malik in debates over Korea. On Aug. 1 he led the fight to halt Malik's attempt to seat the Communist China delegation by a ruling of the chair. On

Aug. 2 he demanded that the U.S.S.R. submit proposals to end the Korean war, asserting (Aug. 8) that the Soviet Union was assisting the invaders and could call off the attack. He consistently held that the U.N. rulings of 1947–49 to the effect that Korea must be unified by popular vote must be adhered to, and persistently declared as false soviet accusations that the South Koreans were the attackers. On Sept. 18 he refuted soviet assertions that the U.S.S.R. had furnished North Korea no arms since 1948 by showing weapons captured in Korea which had been made in the U.S.S.R. in 1950.

**Australia, Commonwealth of.** A self-governing member of the Commonwealth of Nations, Australia is situated in the southern hemisphere. Areas and populations of the six federated states, the Northern Territory and the Australian Capital Territory are:

States and Territories	Capital	Area (sq. mi.)	Population (1947 census)	Population (mid.-1950 est.)
New South Wales	Sydney . . . . .	309,433	2,985,464	3,225,242
Victoria	Melbourne . . . . .	87,884	2,055,252	2,202,869
Queensland	Brisbane . . . . .	670,500	1,106,269	1,183,792
South Australia	Adelaide . . . . .	380,070	646,216	700,257
Western Australia	Perth . . . . .	975,920	502,731	557,918
Tasmania	Hobart . . . . .	26,215	257,117	272,649*
Northern Territory	— . . . . .	523,620	10,866	15,303
Australian Capital Territory	Canberra . . . . .	939	16,905	20,772
		2,974,581	7,580,820	8,178,802

\*Dec. 31, 1949 est.

Full blood aboriginals were estimated at 47,000 and half-castes numbered 24,881 in 1944. Territories under the administration of the commonwealth but not included in it comprise Papua, Norfolk Island, the trust territory of New Guinea, Nauru, the territory of Ashmore and Cartier islands and the Australian antarctic territory. Language: English. Religion: Christian (1933 census: Anglican 2,565,118, Roman Catholic 1,161,455, Presbyterian 713,229, Methodist 684,022, other Christian 603,914); Jewish 37,000. Chief towns (pop. 1947): Sydney (1,484,434), Melbourne (1,226,923), Brisbane (402,172), Adelaide (382,604), Perth (272,586), Newcastle (127,188), Hobart (76,567). Governor general: William John McKell; prime minister: Robert Gordon Menzies.

**History.**—The new government, a coalition of the Liberal and Country parties, with Menzies (Liberal party) as prime minister and Arthur William Fadden (Country party) as treasurer, had taken office just before the year began. Australian public affairs in 1950 were dominated internally by the new government's bill for the suppression of the Communist party and externally by the growing international tension, culminating in the Korean war.

In bringing in a bill for the suppression of the Communist party and affiliated organizations, the government fulfilled an election pledge. The main features of the bill were: the declaration as illegal of the Communist party and certain organizations declared to be affiliated to communism; the power of declaration by the governor-general in council of certain individuals as Communists. Declared individuals became automatically disabled from holding executive office in certain named key trade unions. The bill defined Communists as persons "who support or advocate the objectives, policies, teachings, principles, or practices of Communism as expounded by Marx and Lenin." The bill provided for a right of appeal to the high court by declared persons or associations. It aroused strong public controversy and the opposition of the Labour party. As a result, the government introduced certain amendments, in particular a high-level advisory committee, to advise the government on the declaration of persons and associations. It did not yield on the vital "onus of proof" clause, which charged the "declared"

person to deny on oath that he was a Communist. After months of discussion, the Labour party, faced with the threat of a "double dissolution," of the house of representatives and the senate, withdrew its opposition to the bill. Upon the promulgation of the act, the Communist party became automatically illegal, but implementation of the act was delayed by the party's challenge of the constitutionality of the act before the high court—an action still pending late in the year.

**Industrial and Economic Position.**—By comparison with the previous year, the country was relatively free from major industrial trouble, except for a railway strike affecting most of the Australian states which started early in October.

In June 1950 the basic wage stood at £6.15.0. Returns compiled from 80% of wage earners showed at the same time an average wage of £9.19.0.

The commonwealth arbitration court issued its "basic wage" judgment which increased the basic wage by £1 per week.

Economic activity was sustained on a high level; national income in 1949-50 was £A2,265,000,000, an increase of 16% over 1948-49; the level of employment in June 1950 was the highest on record, with 2,546,900 wage and salary earners. Unemployment in March 1950 was 0.8%, equal to the lowest recorded. Prices rose sharply during the year; the "C" series retail index in June 1950 indicated an increase of 10% over June 1949.

Exports rose to £A617,305,000, an increase over the previous year of 14%. This was mainly the result of further price rises in wheat and, in particular, in wool, which was in keen competitive demand by soviet, U.S. and other buyers. Imports stood at £A536,037,000 for the same period, an increase of 30% over 1948-49.

The commonwealth obtained a dollar loan from the International Bank for Reconstruction and Development, earmarked for the purchase of U.S. machinery and other capital equipment. Australia's overseas funds rose to £A650,000,000, an increase over the previous year of 43%. The budget for 1950-51 gave an estimated balance of expenditure and revenue at: revenue, £A738,700,000; expenditure, £A738,700,000. This was an increase of £A172,078,842 over the previous year.

**Defense Services.**—Estimated expenditure for 1950-51 was £A133,383,000, an increase of £A79,136,853 over the previous year. The increase was almost entirely the result of a vastly increased defense program connected with Australia's active participation in the United Nations action in Korea and a projected expansion of all three arms of the military forces.

**Immigration.**—The number of immigrants was expected to exceed 200,000 in 1950, compared with 149,000 in 1949. It was anticipated that, with the gradual exhaustion of the European pool of displaced persons, the proportion of British immigrants would increase. The absorption of immigrants into production and employment caused no problems, but the housing shortage became more acute. The gap between housing needs and new building was, at the prevailing rate of construction, expected to increase by 30,000 to 35,000 houses a year.

**Foreign Affairs.**—Australia was one of the first members of the United Nations to promise support for U.N. action in Korea, and immediately sent a fighter squadron to fight with the U.S. forces. In September a battalion of the Australian occupation forces in Japan became part of the British Commonwealth brigade fighting in Korea. Under its new minister for external affairs and external territories, Percy Claude Spender, Australia's foreign policy took a sharper antisoviet turn. In the United Nations general assembly, Australia strongly supported intervention in Korea, opposed soviet proposals for disarmament and the banning of atomic weapons, opposed the recognition of the Communist Chinese government and generally supported United States policy. Spender also proposed a Pacific pact which would link a

vast number of Pacific nations, from all the American countries with a Pacific coast to Australia and New Zealand, and including the Republic of the Philippines, Korea and anti-Communist China, as well as the Pacific possessions of the British Commonwealth. (W. FN.)

**Education.**—(1947) State schools 8,212, pupils (average weekly enrolment) 856,753, teachers 32,941; private schools 1,871, pupils (average weekly enrolment) 281,838, teachers 12,484; universities 8, students 30,477, professors and lecturers 2,141.

**Finance and Banking.**—Budget: (1949-50) revenue £A589,500,000, expenditure £A606,000,000; (1950-51 est.) revenue £A738,700,000, expenditure £A738,300,000. National debt (June 1950) £A850,900,000. Currency circulation (Aug. 1950) £A237,000,000. Gold and foreign exchange (March 1950) U.S. \$1,251,000,000. Bank deposits (Aug. 1950) £A855,000,000. Monetary unit: Australian pound with an exchange rate in Nov. 1950 of £A1.25 to the pound and £A0.45 to the U.S. dollar.

**Foreign Trade.**—(1949) Imports £A455,000,000; exports £A535,000,000. Main sources of imports (1948-49): U.K. 51.4%; U.S. 10.2%; India 6.4%; Canada 2.9%. Main destinations of exports: U.K. 42.4%; France 8.5%; U.S. 5.9%; Italy 5.3%. Main imports: machinery 9.8%; cotton and linen piece goods 7.5%; petroleum 5.1%; silk and rayon piece goods 4.1%. Main exports: wool 42.3%; wheat and flour 18.6%; meat 5.4%; butter 4.4%.

**Transport and Communications.**—Roads (1946 est.): 500,497 mi. Licensed motor vehicles (Dec. 1949): cars 747,200; commercial 425,889. Government railways (1948-49): 26,999 mi.; passengers carried 504,076; freight carried 40,225 tons; freight net ton-miles 6,308,000,000. Shipping (merchant vessels of 100 gross tons and more, July 1949) 341, total tonnage 541,516. Air transport (1949): miles flown 43,224,000; passenger-miles 710,900,000; freight net ton-miles 18,000,000; air mail ton-miles 4,100,000. Telephones (Dec. 1949): subscribers 1,066,385. Radio receiving set licences (Dec. 1949): 1,986,180.

**Agriculture.**—Main crops (metric tons, 1949-50): wheat 5,891,000; oats 580,000; maize 178,000; barley 414,000; sugar cane, raw value, 955,000; potatoes 520,000. Livestock (March 1949): sheep 108,500,000; cattle 14,124,000; pigs 1,194,000; horses 1,116,000. Wool production (metric tons, greasy basis, 1949-50): 474,000. Milk production (1949-50): 1,250,000,000 gal. Food production (metric tons, 1949-50): butter 171,200; cheese 45,600; meat 1,048,700, of which beef comprised 611,800.

**Industry.**—Manufacturing establishments (1948-49) 40,010; persons employed, including working proprietors, 890,454. Fuel and power (1949): coal 14,328,000 metric tons; lignite 7,488,000 metric tons; manufactured gas 974,000,000 cu.m.; electricity 9,018,000,000 kw.hr. Raw materials (1949): gold 893,000 fine ounces; refined copper 10,100 metric tons; refined lead 187,000 metric tons; zinc 83,000 metric tons; steel ingots and castings 1,149,000 metric tons. Manufactured goods (1949-50): wool yarn 21,700 metric tons; cement (1949) 1,076,000 metric tons.

**BIBLIOGRAPHY.**—J. B. Greaves, *Economic and Commercial Conditions in Australia* (London, 1950).

**FILMS OF 1950.**—*Animals of Australia, Birds of Australia* (Cornell Associates); *Australian Diary No. 31-36, The Bushman Goes Home, Crocodile Hunters, Plan for Living, Shearing at Big Billabong, Turn the Soil* (Australian News and Information Bureau).

**Austria.** A Republic of central Europe, Austria has an area of 32,388 sq.mi. Pop.: (1949 est.) 7,090,000. Language: German 98%, other 2% (mainly Slovene in Carinthia). Religion: mainly Roman Catholic. Principal towns (pop., 1948 est.): Vienna (cap., 1,730,613); Graz (226,229); Linz (184,336); Salzburg (106,919); Innsbruck (98,561); Klagenfurt (65,950). President of the republic, Karl Renner; chancellor (prime minister), Leopold Figl. During 1950 the Austrian government had jurisdiction throughout Austria, with certain limitations regarding matters control over which was reserved to quadripartite decision in the Allied Council for Austria. By Dec. 31, 1950, members of the A.C.A. were: France, Jean Payart (from June 29); United Kingdom, Sir Harold Caccia (from June 12); U.S., Walter J. Donnelly (from Aug. 24); U.S.S.R., Lieut. Gen. V. P. Sviridov.

**History.**—The total strength of the forces occupying Austria at the beginning of 1950 was 68,500, of which soviet troops numbered 44,000, U.S. 10,000, British 8,500 and French 6,000. In the five years of occupation the military and civilian costs had swallowed up, it was estimated, about 30% of the country's wealth: in 1949 alone contributions amounted to 420,000,000 schillings. In addition, the Russians by enforcing their claim on all former German properties secured possession of most of Austria's oil as well as the assets of the Danube Shipping company. The Soviet Union thus had a tight grip on the nation's economy. For these reasons, the dearest wish of both government and people during 1950 was to achieve a peace treaty and effective inde-

pendence.

Only the U.S. could afford to pay its own occupation costs, but the process of relaxation of controls continued throughout 1950. Such measures of alleviation, however, could bring little comfort. In contrast with the behaviour of the Soviet Union, seemingly concerned with frustrating the patient efforts of the foreign ministers' deputies to get an agreed draft treaty.

Nevertheless, the government felt it incumbent on it to demand that occupation costs should be borne by the occupying powers. A note in this sense was addressed to the powers, and on March 8 Karl Gruber, foreign minister, detailed in the diet some of the other requests that were included: that the strength of the foreign garrisons should be drastically reduced; that requisitioned property should be released; and that all military courts, zonal frontier controls and every form of censorship should be abolished. Chancellor Figl was understood also to have suggested a meeting in Vienna at the highest level to break the deadlock.

This proposal was not taken up. After the 252nd abortive meeting of the deputies on April 26, however, the foreign ministers of the three western powers, on the occasion of their London talks, issued on May 19 a statement that they were willing to settle all outstanding issues if this would bring about agreement on the treaty as a whole; failing that, while the occupation must be maintained, everything possible would be done to lighten the burden, and, to begin with, civilian high commissioners would be appointed to replace the military commanders. A formal reply to the Austrian note was made by the British foreign office on July 13. The concessions comprised a considerable reduction of high commission personnel, further release of requisitioned property, a promise of sympathetic consideration for any plan for ending Allied control of the Austrian broadcasting system and, in time, the abolition of military travel permits. But on the questions of military courts and the right to ban books and newspapers the British government would not yield. (In fact, censorship no longer existed in the British zone.) The U.S. and French governments made somewhat similar responses.

During 1950 Austria received 2,600,000,000 schillings from Economic Cooperation administration funds. In addition, a "stop-gap" allocation of a further 200,000,000 schillings from European Recovery program sources was forthcoming to cover housing costs. But the chronic problem of unemployment (which reached a peak figure of 195,000 in February) persisted, and the ominous date of 1952, when ERP aid would cease, was looming ahead.

As a result of U.S. aid, industrial production rose to 109% of the 1937 figure; agricultural output and the volume of exports, on the other hand, amounted to only 70% of the prewar level. Early in September a crisis developed over fixing the inland price of wheat: the People's party called for a figure higher than the Socialists could accept unless there was a compensatory rise in wages. After some hard bargaining, a new price and wage agreement was reached, on a basis of a 10% increase of wages and salaries, with appropriate increases in pensions and family allowances, to offset the increased cost of living, including the removal of certain food and fuel subsidies. The Communists, however, initiated token strikes and demonstrations, with the deliberate connivance of the soviet authorities in Vienna; and then on Sept. 30 a conference of several hundred Communist shop stewards issued an ultimatum calling for a general strike unless the wage and price agreement were withdrawn by Oct. 3. By that time, however, the government and trade union leaders regained complete authority over the bulk of the workers, and the strike was called off. Only in the soviet zone were there any serious disturbances.

For the time being the Communists ceased to count as a serious

AUSTRIAN HOUSEWIVES in excited talk over the "wonder caldron," or self-service laundry, installed in Vienna in 1950 by two U.S. businessmen as the first establishment of its kind in central Europe

factor in Austria's internal politics. At the peasant chamber elections held in Lower Austria in April they failed to win a single seat. In local elections held in May in the same soviet sector of Lower Austria they polled only 5.23%, against 51.96% for the People's party and 39.97% for the Social Democrats. Ten of the 11 Communist mayors lost their seats. (W. H. CAR.)

**Education.**—Schools (1948-49): elementary 4,956, pupils 829,326, teachers 34,105; secondary 167, pupils 47,310, teachers 3,476; technical and commercial 64, students 20,739, teachers 1,691; teachers' training colleges 28, students 4,821, lecturers 534; universities 4, students 19,762, professors and lecturers 1,684.

**Finance and Banking.**—Budget: (1949) revenue 6,091,000,000 schillings, expenditure 7,532,000,000 schillings; (1950 est.) revenue 9,617,000,000 schillings, expenditure 10,695,000,000 schillings. Internal debt (Dec. 1949) 11,826,000,000 schillings. Currency circulation (Sept. 1950): 5,863,000,000 schillings. Bank deposits (Aug. 1950) 6,864,000,000 schillings. Monetary unit: schilling, with an exchange rate (Nov. 1950) of 21.49 schillings to the U.S. dollar.

**Foreign Trade.**—(1949) Imports 4,477,200,000 schillings; exports 3,228,000,000 schillings. Main sources of imports: Germany 16%, Italy 12%, Czechoslovakia 9%, U.S. 6%. Main destinations of exports: Italy 18%, Germany 8%, Czechoslovakia 7%, Yugoslavia 7%.

**Transport and Communications.**—Roads (1947): 53,000 mi. Licensed motor vehicles (Dec. 1949): cars 37,350; commercial 54,620. Railways (Jan. 1949): 3,728 mi.; passenger-miles (1948) 2,617,000,000; freight net ton-miles (1949) 3,311,000,000. Telephones (1949): subscribers 231,857. Wireless licences (1949): 967,787.

**Agriculture.**—Main crops (metric tons, 1949): wheat 350,000; barley 197,000; oats 286,000; rye 365,000; maize 132,000; potatoes 2,008,000; sugar 52,000. Livestock: cattle (Dec. 1949) 2,200,000; sheep (Dec. 1948) 454,000; pigs (May 1950) 2,024,000; horses (Dec. 1948) 286,000; poultry (May 1950) 4,140,000.

**Industry.**—Insured persons employed (Dec. 1949): 1,896,966. Fuel and power (1949): coal 184,000 metric tons; lignite 3,816,000 metric tons; electricity 4,164,000,000 kw.hr. Raw materials (metric tons, 1949): iron ore 1,728,000; pig iron 838,000; crude steel 835,000; magnesite 521,000; lead smelter 8,600. Manufactured goods (metric tons, 1949): woven cotton fabric 12,000; cotton yarn 18,000; fertilizers 288,000; chemical and paper pulp 430,000; cement 1,098,000.

**Automobile Industry.** The automobile industry of the United States established in 1950 a new all-time production record for the second successive year. Total 1950 production was 7,987,493 vehicles, of which 6,649,492 were passenger cars; 1,333,258, trucks; and 4,743, motor coaches.

Monthly factory sales are shown in Table I.

**Table I.—Motor Vehicle Factory Sales From Plants Located in United States, 1950**

	Passenger cars	Motor trucks	Motor coaches	Total
January	487,824	93,323	219	581,366
February	385,361	89,971	133	475,465
March	469,618	110,843	199	580,660
April	455,193	103,850	268	559,311
May	575,518	120,963	412	696,893
June	720,688	135,332	598	856,618
July	595,067	111,208	397	706,672

The 6,649,492 passenger cars represented an increase of 1,530,000 cars, or 30%, over the 1949 total. Commercial vehicle production increased by 204,000 units, or 18%. Along with total vehicles produced, the 1950 passenger car total was a new record. However, commercial vehicles fell short of the 1948 record of 1,376,155 units. In comparing the gains of passenger cars and commercial units, it is interesting to note the emphasis which was placed on truck and bus production in the years immediately after World War II (see Table II). With the needs of industry becoming less pressing, the manufacturers were able to divert a larger share of available materials to the production of passenger cars during 1949 and 1950.

**Table II.—Division of Output Between Passenger Cars and Commercial Vehicles, in the U.S.**

Year	Total Vehicles	Per Cent Passenger Cars	Per Cent Commercial Vehicles
1936	4,454,115	82.5	17.5
1937	4,808,974	81.5	18.5
1938	2,489,085	80.3	19.7
1939	3,577,292	80.2	19.8
1940	4,472,286	83.1	16.9
1941	4,840,502	78.0	22.0
1946	3,089,550	69.5	30.5
1947	4,797,922	74.1	25.9
1948	5,285,425	74.2	25.8
1949	6,253,602	81.8	18.2
1950	7,987,000	83.3	16.7

Source: Automobile Manufacturers Association.

These production records resulted in the establishment of new high levels of wholesale value for both passenger cars and total vehicles. A tabulation of estimated 1950 wholesale values along with those of preceding years appears in Table III.

**Table III.—Wholesale Value of Industry Output in U.S.**

	Wholesale Value	Per Cent Increase 1950
<b>Passenger Cars</b>		
1950*	\$8,830,000,000	—
1949	6,768,418,000	30
1941	2,567,205,996	244
1929	2,847,118,562	210

**Exports-Imports.**—United States automobile exports in 1950 totalled 303,000 vehicles, as compared with the 1949 total of 287,775. As shown in Table IV, the percentage of United States automobile production absorbed by the foreign market steadily declined after 1947. The 1950 figure of 3.8% represented the lowest portion of total output sold to foreign markets in the

**Table IV.—Percentage U.S. Motor Vehicle Production Exported**

history of the industry.

Imports totalled 19,700 vehicles in 1950, more than double the 1949 volume. Although these 19,700 vehicles represented only 0.25% of the total U.S. market, it is significant that prior to 1947, U.S. imports had never reached 2,000 vehicles. Imports from 1947 through 1950 were as follows: 1947, 2,124; 1948, 29,112; 1949, 8,366; 1950, 19,700.

**Production.**—The production achievements of the industry were, of course, made possible by the general high level of business activity throughout the country. With a few exceptions, most manufacturers were unable to provide their dealers with enough cars to supply the demand—at least not until the last month or so of the year. There was a decline in new car orders during the early part of the year. At that time, general unemployment was increasing and the government designated some areas of the country as "critical"; i.e., having more than 12% of the labour force unemployed. A few manufacturers reduced production, and some alarm was expressed over the appearance of "bootlegging," the selling of new cars by used car dealers at sharply discounted prices. However, the normal spring market had already started to lengthen order lists when the North Korean Communists attacked South Korea on June 25. The decision for U.S. intervention in this conflict produced a veritable deluge of new car orders.

Production-wise, the U.S. stand against the Communist aggression had little immediate effect on the industry, and it was not until later that defense contracts and material stockpiling began to reduce the amount of nickel, aluminum, chromium and steel available to the auto makers.

**Labour.**—The basic issue of each of the labour-management contract settlements of 1950 was the establishment of a suitable pension program. Unfortunately, negotiations between the union and one of the large producers could not be successfully concluded before a strike date in late January. The ensuing 100-day strike was the most costly in the history of the industry; it was estimated to have caused the loss of 490,000 vehicles.

Shortly after this dispute was settled, the industry's largest manufacturer announced a new agreement with the union which contained several significant features. In addition to the pension provisions, it contained an agreement for an annual improvement factor of four cents per hour. This improvement factor was granted in anticipation of further technological progress, rather than as a general pay raise which would be passed on to the consumer through an increase in car prices.

Retained from the previous contract was the cost-of-living escalator clause, which guaranteed additional wage increases should the cost of living increase appreciably. However, wage rates could not be reduced below the basic level even if prices were drastically reduced. Also provided were various social insurance benefits.

In return for these provisions, the union agreed to a five-year contract period, with no reopening clauses. This agreement, with its many advantages to the workers and guarantee of five years of labour peace for the manufacturer, immediately became the pattern for settlements by most of the smaller manufacturers of the industry. By the end of the year, practically every contract

in the industry included the annual improvement factor and the cost-of-living escalator clause.

**Prices.**—In general, the introduction of the 1950 models did not result in appreciable price changes, although a few manufacturers improved their competitive position by reducing prices about \$100. With the high rate of production continuing to reduce waiting lists and to place more and more new models on a virtual immediate delivery basis, used cars continued their gradual price decline, reaching a particularly low level in March when the aforementioned bootlegging was at its height.

These prices firmed with the arrival of the normal spring market, and the advent of the Korean war sparked a dizzying climb that saw some models selling for \$1,000 more than their new list price. In less than two months, however, it became apparent that automobile production was not going to be immediately curtailed, and used car prices began to decline nearly as fast as they had increased.

The pension and wage increase agreements mentioned previously, coupled with increases in the cost of practically every material used in the manufacture of automobiles, were harbingers of the industry's own price increases. In general, as each 1951 model was introduced, the manufacturer was forced to announce a price increase of about \$100.

All independent manufacturers (that is, all producers excluding the "big three") had announced their 1951 models and new prices during the late summer and early fall. The "big three" of the industry did not reveal the price tags which their new cars would carry until December. However, on Dec. 16, less than two weeks after these increases were announced, the government ordered a rollback of automobile prices to levels existing on Dec. 1. Thus, these manufacturers were required to sell the new models at the same price levels which had applied to their 1950 counterparts.

**Sales.**—From a sales viewpoint, the most serious event of the year was the reimposition of regulation W, the government's

credit control bill which had limited purchases during and immediately after World War II. A mild form of this control, requiring a one-third down payment with the balance to be paid within 21 months (three months longer than the wartime version) was restored in September. These terms were short-lived, however, for in the middle of October the federal reserve board reduced the number of months from 21 to 15, retaining the one-third down payment provision. Both new and used car sales were hard hit by this order.

**Styling.**—From a styling standpoint, the outstanding feature of the 1950 model year was the popularity and extension of the "hardtop convertible" styling introduced in 1949. Not convertible in the true sense of the word, these cars embodied the racy lines of a convertible while retaining a fixed steel top. This body style was extended to include four-door sedans in 1950. About half of the 1950 models offered hardtop styling.

In other respects 1950 styling differed only slightly from that of 1949, since most manufacturers had provided totally new styling for the 1949 models. The majority of the 1950 changes were of the "face-lifting" variety.

**Engines.**—Two aspects of the engine field merit recounting here. One, the year's progress in the development of high compression engines; the other, the introduction of a gas turbine propelled vehicle.

In 1947 the practicability of an engine with a compression ratio of as high as 12 to 1 had been demonstrated before a meeting of the Society of Automotive Engineers. Less than two years later, the salient features of this engine were made available to the public in two new engines. These engines had compression ratios only slightly higher than the general average, since lack of a nation-wide supply of the very high octane fuel required precluded operation at a 12 to 1 ratio. However, their improved design, featuring an exceptionally rigid block, heavy crankshaft and overhead valves, resulted in increased output per cubic inch and improved gasoline mileage. Moreover, their construction was

such that major redesign would not be necessary to increase their ratios to 10 to 1 or 12 to 1.

The performance and economy of these engines, and the public's appreciation of these features, served to accelerate other manufacturers' engine programs. One totally redesigned engine, similar to the two aforementioned engines, was presented late in 1950. Of V-8 design, it had a five-bearing crankshaft, overhead valves and a block said to be sufficiently strong for operation at compression ratios as high as 14 to 1. The ratio of the engine as it was shown was 7 to 1. Several other new engines were in process.

Early in 1950 a British firm displayed a gas turbine propelled passenger car. Presented quite frankly as an experimental model, not intended as an immediate competitor of piston engines, it gave automotive engineers a chance to see some of the inherent problems which turbine installations involve. As in the case of most new developments, the car was given a large amount of publicity, not all of which took care to point out the many limitations of the unit in its existing form. Essentially, its disadvantages were poor fuel economy (especially at light load), excessive noise, lack of engine braking (and hence the need for larger capacity vehicle brakes) and the lack of a by-pass between the gas generator and the power turbine—a condition somewhat analogous to driving a car with an automatic transmission locked in the drive position.

**Automatic Transmission.**—Of even more interest than the high compression engine program was the spectacular increase in the number of automatic transmissions offered and sold during 1950. It was estimated that considerably more than 1,500,000 fully automatic units were produced during the year.

The first true automatic transmission was introduced in 1940, but had little time to prove its value before the industry converted to war production. Consisting of a fluid coupling and a four-speed planetary gear set, its operation was completely automatic. Shifting of gears was basically controlled by the speed of the car through a governor and hydraulic control system. Refinements such as the delaying of shifting action in accordance with the accelerator position were also included.

This initial step-by-step gear-shifting transmission remained

the only automatic type available for eight years, and in 1950 was still produced in greater quantities than any of the succeeding automatics. In 1948 a new type, the hydraulic torque converter, made its appearance. This unit normally employs no gears, but accomplishes its function of torque multiplication by means of a vaned hydraulic pump and turbine arrangement. Maximum torque multiplication of about 2.2 to 1 occurs at stall, the ratio decreasing to 1 to 1 at a speed between 15 and 45 mi. per hour, depending upon the road conditions. Planetary gears are provided for reverse and extra-low gear use, but are not utilized in normal operation. Since no gears are employed, this transmission gives very smooth acceleration. This smoothness and the lack of a complex control system make the torque converter type of transmission very attractive, and all of the succeeding transmission designs incorporated a hydraulic torque converter.

Some of the more recent automatics included a lock out feature which eliminated the converter's coupling action by giving a direct connection between the engine and wheels at normal driving speeds. This feature was designed to reduce power losses in the fluid coupling and thus improve fuel economy.

Two manufacturers were offering a unit which included both a torque converter and a step-by-step planetary gear arrangement. In this design, starting torque is increased by both the hydraulic converter and a step-by-step planetary gear arrangement, the unit automatically shifting into direct drive at some speed between about 20 and 60 m.p.h., depending upon the throttle opening. After the unit has shifted, the torque converter is locked out in one model and retained as an active part of the power train in another. With the combination of automatic gear shifting and a torque converter, these transmissions were said to incorporate the best features of each type into one unit.

By the end of 1950 all automatic transmission manufacturing facilities were operating at full capacity, and this feature was proving so popular that only a few makers were able to offer the new convenience to all who desired it. (See also MOTOR TRANSPORTATION.)

**Automobile Insurance:** see INSURANCE.

**Automobile Racing.** Johnny Parsons of Van Nuys, Calif., annexed the big prize of the sport in a year that saw United States drivers burning up old records in almost every major event. Driving his Kurtis-Kraft Wynns Special despite a cracked engine, Parsons won the 1950 Indianapolis speedway classic on Memorial day, before 150,000 spectators. A rainstorm brought a sudden end to the traditional 500-mi. grind after 345 mi., but Parsons was conceded an easy first place, a position he had held almost from the start, and his average speed of 124.002 m.p.h. was an all-time high.

The other placings did not receive official sanction because of the shortened distance. Official standings were: Bill Holland of Reading, Pa., with his Blue Crown Special, second; Mauri Rose, of South Bend, Ind., in a Howard Keck Offenhauser Special, third; and Cecil Green, Houston, Tex., in his John Zink Special, fourth.

Henry Banks of Compton, Calif., carried off the scoring championship of the American Automobile association, compiling a string of victories in midget auto racing as well as in big-car tests.

The major event of the year for stock cars was the 2,178-mi. race from Juarez, Mex., on the United States border, to El Ocotil, Mex., on the Guatemalan frontier. The long grind, marking the opening of Mexico's stretch of the Pan-American highway, was won by Hershel McGriff of Portland, Ore. McGriff,

PRODUCTION AND CONSUMPTION in the U.S. automobile industry, as shown in a graphic survey published in the *New York Times* during 1950

FIRST TURN of the 500-mi. speedway classic held at Indianapolis, Ind., May 30, 1950. The race was halted by rain at the 345-mi. mark and Johnny Parsons was declared the winner for his average of 124.002 m.p.h., a record for the event

behind the wheel of a 1950 Oldsmobile, took the six-day test with an elapsed time of 27 hr. 34 min. 25 sec. Tom Deal of El Paso, Tex., in a Cadillac, was second. (T. V. H.)

**Aviation, Civil.** An analysis of 226 air lines in operation throughout the world as of April 1950, of which 55 were United States flag operators and 171 of other countries, shows that four-fifths of the world's scheduled air line services were being conducted with U.S.-built aircraft. While the U.S. share of the total scheduled aircraft-miles dropped to 48% from 52% in the previous year, U.S. flag carriers increased their revenue ton-mile capacity by 8% during the year, and by 35% since 1948. It was anticipated that still further substantial additions to the U.S. civil fleet would result from the faster and larger versions of air transports which were on order for delivery during 1951 and 1952, including more than 100 Douglas DC-6Bs and Lockheed Constellation 1049s.

**Scheduled Air Transport.**—In 1950 the U.S. civil air line industry experienced its best year since the end of World War II. International and domestic scheduled air carriers made traffic gains comparable to, or greater than, those reported in the record year of 1949. Total operating revenues increased about 8%, while operating expenses increased about 5%. This difference

largely accounted for a 47% increase in net operating income to a total of \$66,800,000, a far cry from the heavy operating deficits of 1946 and 1947.

Collectively, the industry added 16.7% in passenger miles over 1949, 11.6% in mail ton-miles and 19.7% in cargo services, including express and freight. Altogether, 18,828,000 passenger trips were reported, while total revenue loads, including passengers, mail and cargo, reached a record figure of 1,230,000,000 ton-miles, up 16.8% from 1949.

The distribution of revenues among the three major sources of traffic for the scheduled air carriers remained about the same in 1950 as in 1949, passengers accounting for 73%, mail for approximately 17.5% and cargo for 6.7%. Average unit receipts for freight dropped to slightly less than 19 cents per ton-mile for the first time, reflecting the increasing volume of back-haul freight movement at special commodity rates.

The 16 domestic trunk lines alone more than doubled their net operating income, from approximately \$25,000,000 in 1949 to more than \$51,000,000 in 1950. The 12 local service air lines had an operating net of \$500,000, in round figures, contrasted with a loss of about the same size during the previous year. The 13 international and overseas air lines, on the other hand, showed a decline of about 28%, to a net operating income of \$15,300,000 for the year. Nevertheless, Pan American World Airways reported that its 1950 traffic volume was the greatest in its 24-yr. history. The company transported more than 1,000,000 passengers and 50,000,000 lb. of cargo during the year, in addition to military contract operations on the trans-Pacific Korean air lift.

**Air Coach Operations.**—The year witnessed a continuous, gradual extension of air coach operations on the part of the scheduled carriers, while the so-called irregulars, or nonscheduled operators, found it more and more difficult to maintain their services in the face of stiffening Civil Aeronautics board restrictions. During the spring, T.W.A. (Transcontinental & Western Air, Inc.) and American Airlines began using modern high-speed Constellations and DC-6 type equipment with high-density seating in transcontinental New York-Los Angeles coach operation. In July they both reported load factors of more than 90%, with bookings several weeks in advance. Ten major air lines were offering coach service on various routes reaching 32 domestic cities in July 1950, including 16 of the 20 leading traffic-generating points. Load factors on the Los Angeles-San Francisco run were particularly heavy, with fares as low as three cents per mile.

For the first four months of 1950, revenue passenger miles on air coach showed a tenfold increase over a similar period for 1948. In fact, much of the increase in total passenger air traffic during the year came from air coach. Altogether, domestic air lines carried about 48.5% of the total U.S. first-class rail and air travel market in 1950, compared with 43% in 1949.

Table I.—U.S. Scheduled Air Carrier Operations

	(Calendar year)	1949	1950 (CAA estimate)
Revenue passengers carried—Total		16,600,771	18,828,000
Domestic		15,080,704	17,162,000
International		1,520,067	1,666,000
Revenue miles flown—Total		456,165,882	460,453,000
Domestic		351,639,998	367,184,000
International		104,525,884	93,269,000
Revenue passenger-miles flown (000)—Total		8,806,576	10,115,000
Domestic		6,752,578	7,929,000
International		2,053,998	2,186,000
Passenger-miles flown (000)—Total		9,233,945	10,600,000
Domestic		7,065,146	8,283,000
International		2,168,799	2,317,000
Ton-miles of express carried—Total		77,217,799	80,740,000
Domestic		27,773,669	37,010,000
International		49,444,130	43,730,000
Ton-miles of freight carried—Total		101,969,397	136,119,000
Domestic		95,227,983	120,519,000
International		6,741,414	15,600,000

Table II.—U.S. Scheduled Air Carrier Operating Revenues and Income

	(Calendar year)	1949	1950 (estimate)
Totals:			
Operating revenues		\$755,877,711	\$813,210,000
Operating expenses		710,402,051	746,410,000
Net operating income		45,475,660	66,800,000
Unit ratios:			
Revenue ton-mile receipts—average		57.36 cents	54.7 cents
Revenue ton-mile expenses—average		54.29 "	49.4 "
Passenger mile receipts		5.76 "	5.5 "
Mail ton-mile receipts		110.17 "	103.6 "
Express ton-mile receipts		32.78 "	33.9 "
Freight ton-mile receipts		19.46 "	19.0 "

U.S. domestic scheduled services maintained their high safety record of recent years with only four fatal accidents, the same number as in 1949. On the basis of passenger fatalities this was a rate of 1.2 per 100,000,000 passenger miles flown in domestic operations, compared with 1.3 for the previous year. One

international accident in 1950, resulting in 48 deaths, against none in 1949, brought the combined over-all rate to 1.4, compared with 1.0 in 1949.

**Other U.S. Civil Aviation Activities.**—The year 1950 marked a definite turning point in the history of the personal plane industry, which had seen sales diminish each successive year since 1946. Based on official statistics for the first 11 mo., and unofficial reports for December, the total number of personal aircraft sold during the year exceeded 3,400, with a manufacturer's value of about \$18,500,000. This compared with 3,370 personal planes sold in 1949 and valued at \$14,324,000. The increase in dollar volume reflected the demand for the larger types of four- and five-place models used primarily for executive travel. About 100 helicopters were built during the year for military and commercial purposes. The use of light aircraft for agricultural purposes continued to grow with a total of about 10,500 planes owned by farmers and ranchers.

In general, flying schools and fixed base operators found 1950 a difficult year. The number of student pilots dropped off as the number of World War II veteran applicants decreased. There was a 17% decline in the number of private pilot certificates issued, from more than 30,000 to 25,000; and a 29% reduction in the number of commercial pilot certificates issued. (See also CIVIL AERONAUTICS ADMINISTRATION.)

Table III.—Selected Statistics for U.S. Civil Aviation  
(Calendar year)

	1949	1950 (CAA estimate)
Number of certificated pilots . . . . .	525,174	550,000
Number of student pilot certificates issued . . . . .	49,575	45,400
Number of private pilot certificates issued . . . . .	30,278	25,000
Number of commercial pilot certificates issued . . . . .	7,123	5,030
Number of air-line transport pilot certificates issued . . . . .	1,060	800
Number of U.S. civil aircraft . . . . .	92,622	92,650
Number of scheduled air carrier aircraft . . . . .	1,096	1,200
Two-engine . . . . .	610	675
Four-engine . . . . .	469	490
Other . . . . .	17	35
Number of civil aircraft manufactured . . . . .	3,545	3,500
Number of civil airports . . . . .	6,131	6,060

During the last half of the year, the shadow of the Korean war and the mobilization activities to which it gave rise made still more uncertain the immediate outlook for civil aviation which was not directly or indirectly related to the defense effort.

As the year closed, the Civil Aeronautics administration made mandatory the filing of flight plans for planes entering or flying within designated Air Defense Identification zones. The general areas affected were: a zone several miles in diameter around each atomic energy plant; zones surrounding the cities of San Francisco and Los Angeles, Calif.; and zones covering the Atlantic and Pacific ocean areas seaward to a line about 20 mi. offshore. Also, flight plans were required for planes entering the United States from Canada east of Wisconsin.

For the first time since the end of World War II the use of civilian aviation flight and ground schools was planned for large-scale training of air force personnel. Approximately 10,400 United States air force technicians were to be trained in civilian trade schools by July 1951; and contract training of a minimum of 2,250 basic flight cadets was announced at five fields to be operated by civilian flight school contractors.

The CAA Federal Aid Airport program went on a defense footing, with 1950-51 projects being screened to meet the government-wide cut in nondefense construction. Grant agreements entered into during 1950 numbered 598, involving \$40,600,000 in federal funds. Projects completed during the year numbered 452, with \$27,300,000 in federal funds expended.

The National Production authority at the end of the year gave the Civil Aeronautics administration authority to use DO priority ratings for construction and maintenance of civil transport

THE MARTIN 4-0-4, twin-engined commercial air liner, first flown in Oct. 1950. It had a maximum range of 2,575 mi. and a top speed of 312 m.p.h.

planes, as well as on purchases of equipment for federal airports and airways, because of their close relationship to national defense. This was the first time NPA had allowed use of the rating for any civilian purchasing.

In the meantime, employment in the basic aircraft industry, which totalled about 256,000 in June 1950, was expected to reach 500,000 by mid-1951. (See also AIRCRAFT MANUFACTURE; AIRPORTS AND FLYING FIELDS; AVIATION, MILITARY; CIVIL AERONAUTICS ADMINISTRATION; JET PROPULSION; PETROLEUM.)

(J. P. V. Z.)

**Great Britain, Commonwealth and Europe.**—In 1950 British commercial air transport began to use new aircraft which had been delayed in delivery, and so entered the phase in which more satisfactory financial results could be expected; yet in the course of the year there were unexpected setbacks. Some of the effects of the devaluation of sterling were felt and for the first half of the year, British Overseas Airways corporation was still without most of the new aircraft on which it had counted. Not until November was this handicap fully removed. At that point, the corporation ceased to operate flying boats and all its services thenceforward were flown by land aircraft. These were expected to produce economies both in the cost of operation per ton-mile and through the saving of expense on the maintenance of marine stations on the routes to the far east and to South Africa. British European Airways corporation was not due to receive the first of its new aircraft until early in 1951.

For the greater part of the year therefore both corporations were in much the same position of having to use a proportion of old-type aircraft at a time when they wished to develop and increase their services. In common with other operators they sought to increase their traffic and the hours flown by their aircraft by offering cheap return fares during "off" seasons on the long runs and at less popular hours on the short routes. The result was to increase the number of passengers and also the number of capacity ton-miles flown. Unfortunately the rise in capacity exceeded the rise in passenger ton-miles in both corporations, but the extra traffic obtained by B.E.A. through cheap fares appeared to be balancing the direct operating cost of the aircraft employed on the early and late services and so helped to spread administrative costs over a bigger total of ton-miles flown. To this extent the policy justified itself but the dual difficulty of coping with seasonal traffic and of obtaining a big enough average flow of traffic at existing rates to show a profit had still to be solved. B.O.A.C., in the financial year ended March 30, 1950, had a deficit of £7,791,887 and B.E.A.'s deficit in

the same year was £1,363,594 or about half that of the previous year. The loss suffered by B.O.A.C. included that of British South American Airways corporation (amalgamated with B.O.A.C. in 1949) and a sum of about £1,750,000 was accounted for by the grounding of the Avro Tudor aircraft which B.S.A.A. had been using.

By November B.O.A.C. was fully re-equipped. It had received its overdue Stratocruisers and Hermes IVs. It had been able in the summer to increase its trips between London and New York from seven to eight a week. From November, it used a new land-plane route between London and Johannesburg, U. of S. Af. Three times a week this route was by way of Tripoli, Kano, Brazzaville and Livingstone, and twice a week the more familiar route through Cairo, Khartoum and Nairobi was used.

Operating the home and European services, B.E.A. continued to make progress within the limitations imposed by its equipment and to prepare for further development. In the course of the year B.E.A. lost the right to carry loads to and from Lisbon, Port., through the insistence of Portugal on that country's right to carry half the available traffic between London and Lisbon. As B.O.A.C. was calling regularly at Lisbon and was able to handle all the traffic left under this arrangement B.E.A. agreed to discontinue its services. In their place it opened services to Madrid, Sp. On other European routes the corporation's business was generally bigger than in 1949. In the summer months the traffic increased by about 30%, part of the increase being accounted for by cheap fares on early and late services. Home services were much less profitable and there were signs at the end of the year that the corporation intended temporarily to resign a bigger proportion of the home routes to private operators licensed as associates of the corporation. In 1950 about 48 routes were operated by associates. The corporation announced in November that it intended to take over six of those routes but was prepared to recommend that more than 70 of the smaller routes should be allocated in 1951 to associates.

By its experimental service of helicopters between Liverpool, Eng., and Cardiff, Wales, B.E.A. showed its ultimate belief in the helicopter as the vehicle for most air services with stages of less than 200 mi. This daily helicopter service did not show a profit but as the corporation was paid a fee for some operational research work undertaken in the course of the service, the net loss was small enough to be offset reasonably against the experience gained. The six-month contract for the carriage of night mails by helicopter between Peterborough and Norwich which ended in April was both profitable and successful. This service, flown throughout the winter months, with a ban on operations when the cloud base was below 500 ft. or the visibility less than half a mile, achieved a regularity record of 96.6%.

Another hint of developments to come was seen in the use for brief periods on two routes of the new Vickers Viscount turbo-prop liner. This was operated on regular services for one week on the Edinburgh route and for two weeks on the Paris route. Soon afterward a firm order was placed for 28 Viscounts with provision for deliveries to begin late in 1952. Preparations were also made for putting the Airspeed Ambassador liners into service in the spring of 1951 for the carriage of big holiday loads particularly between London and Paris. The Ambassador was intended to carry 50% more passengers than the Viking at a cruising speed about 60 m.p.h. faster.

Independent air operators also had a year of fair activity. Besides acting as associates of B.E.A., several were engaged at times of pressure to help with the regular services or the freight-carrying of the two corporations. They were busy too with a great variety of private charters. Two independent services still run by private operators were the motorcar ferry across the English channel (which handled 4,000 cars and 1,000 motor-

cycles) and the weekly flying-boat service between England and Madeira. The charter companies in general obtained extra business through the Holy Year pilgrimages to Rome, the Council of Europe at Strasbourg, Fr., and holidays organized by tourist agents, student bodies and the Boy Scouts association. One company obtained a contract from the war office to carry troops between England and west Africa. There was some development of the dusting and spraying of crops from the air and an experiment was made in the treatment of hill land near Plynlymon with superphosphate pellets.

In the handling, supervision and control of commercial aircraft over the United Kingdom there were some important improvements. Early in the year a new radar station with a range of 140 mi. was established at London airport; its purpose was that of monitoring traffic over the southern part of England and of helping liner captains in that area with information about their position, height and bearing. A plan was also announced for creating a series of seven traffic lanes leading into the chief air traffic centres in England, Scotland and Northern Ireland, the intention being to equip each lane with radio ranges to enable pilots to fix with a high degree of accuracy their positions in the approach lanes. The first lane was brought into use in August.

Within the commonwealth there was some expansion and the promise of more. Canada was engaged for several months in negotiations with the United States arising out of Canada's proposal to run services to New York. This was resisted by the United States line already handling this traffic; but Canada, strengthened by its acquisition of Newfoundland and consequent control of Gander airport, pressed its claim and was allowed to open a service in April. About the same time Trans-Canada Air Lines had second thoughts about its plans to order Avro Jetliners (made in Canada) for its main services. Up to the end of the year the outcome of this reconsideration had not been announced. The privately owned Trans-Pacific Airways, which had already ordered two Comet jet air liners for its proposed service from Vancouver to Tokyo by way of the Aleutian Islands, found itself in some difficulty by the decision of the U.S. not to continue to maintain certain bases along that line.

Australia too showed an interest in the Comet and also in the Indian ocean route from Western Australia to Johannesburg, touching at the Cocos Islands and Mauritius, but nothing had been settled on either point by the end of the year. On its existing services Qantas Empire Airways made a profit in the previous complete year. Toward the end of the year Tasman Empire Airways of New Zealand opened a service between Sydney, Austr., and Christchurch, N.Z., and so for the first time linked New Zealand's south island with Australia by a regular line. New services with flying boats were also being organized from Australia to the Solomon Islands, the New Hebrides, New Caledonia and various other islands. Inside Australia there was little development. Australian National Airways operated a beef service between the killing station at Glenroy and the port of Wyndham, a run of 180 mi. More than 2,000,000 lb. of meat was carried in the five-month season. This company also became a minority shareholder in Air Ceylon, established to operate long distance services. In New Zealand the state-owned New Zealand National Airways was offered for sale by the new government.

The chief event in Africa was the completion of the big airport at Livingstone and the removal of flying boats from the main routes. The two corporations serving central and east Africa with their bases at Nairobi continued to expand.

India, was, if anything, overserved with air transport. Among its 16 companies there was little prosperity and a new government policy on air transport was expected. Difficulty in communications between Assam and Calcutta arising from the crea-

AVRO CANADA JETLINER, first commercial gas-turbine powered aircraft to fly on the North American continent. During 1950 test flights, it established a North American speed record for its type, cruising at 450 m.p.h.

tion of east Pakistan was relieved to a large extent by air transport. Similar enterprise was shown in Pakistan in the operation of a service from Peshawar, Pak., to Gilgit, India, following the valley of the Indus through the mountains of the northwest frontier.

European air operators generally had a difficult time during the year. For the first time in recent years K.L.M. (Koninklijke Luchtvaart Maatschappij, the Royal Dutch Airlines) failed to make a profit. There were doubts as to whether Sabena (Société Anonyme Belge d'Exploitation de la Navigation Aérienne) would show a profit. Discussions took place between these two companies and Swissair with a view to a closer pooling arrangement to embrace aircraft maintenance and stocks of spares. The three Scandinavian companies also drew closer together in search of further co-operative economies. France alone undertook expansion, acquiring additional U.S. as well as home-produced aircraft and plunging ahead with a scheme of differential fares based on aircraft seating arrangements. Air France and its associates were reported to have seven different fare scales by the end of the year.

Table IV.—Revenue Statistics for British Air Lines

(Financial years, April 1—March 31)

	B.O.A.C.		B.E.A.C.	
	1948-49*	1949-50	1948-49	1949-50
Operating revenue . . . .	£17,717,220	£19,530,584	£5,312,654	£6,884,935
Operating expense . . . .	24,962,497	26,102,495	7,820,927	8,104,285
Operating deficit . . . .	7,245,277	6,571,911	2,508,273	1,219,350
Nonoperating expense . . . .	560,697	1,219,976	226,565	91,472
Total deficit . . . . .	7,805,974	7,791,887	2,734,838	1,310,822

\*1948-49 figures are those shown in the corporation's report and accounts for 1949-50 and exclude from nonoperating expense profit on disposal of assets and redemption of stock. The total deficit for B.O.A.C.-B.E.A.C. as shown in the 1948-49 accounts is £6,977,777.

FILMS OF 1950.—*Mr. Groundling Takes the Air* (Teaching Film Custodians Inc.). (E. C. Sd.)

**Aviation, Military.** **United States Air Force.**—Participation in the Korean war as a member of the United Nations air-land-sea team took precedence over other United States air force activities during 1950.

During the first half of 1950 budgetary limitations had necessitated a downward readjustment from previously programmed strength. In spite of loss of personnel, the closing of installations and the curtailment of numerous programs, the air force sought to increase its combat capacity, and to this end advanced the program of joint training with the other military services.

When war broke out in Korea on June 25, the U.S.A.F. accomplished the evacuation of U.S. nationals from the area of conflict with troop carrier aircraft. F-80s and F-82s, based in Japan, protected the evacuation area and escorted the transport planes.

As a result of Pres. Harry S. Truman's decision on June 27 to use U.S. air and naval forces to carry out the mandate of the United Nations Security council, the far east air force began active combat operations, and during the afternoon of that day, while carrying out their assigned missions, U.S. fighters destroyed six Korean Communist planes.

F-51 (propeller-driven) and F-80 (jet) fighters helped halt the onrushing mechanized advance of the Korean Communist army, while B-26 and B-29 bombers flew far behind the enemy ground force fighting lines to blast the invader's production, supply and distribution plants and depots. Major bombing missions were carried out against Communist-held Seoul; the Communist capital, Pyongyang; and the Wonsan oil refineries and factories.

After initial resistance by North Korean aircraft of soviet manufacture, U.N. forces gradually assumed mastery of the air. The air force then concentrated on giving tactical support to the ground and naval forces and seriously disrupted the enemy's war-making capacity.

Construction funds were made available during Dec. 1949 for an Aircraft Control and Warning system, earlier authorized by congress, and in Oct. 1950 the air force announced a speed-up in production of equipment and training of men to put the system into operation well before the July 1951 dead line. The Lockheed F-94 (an adaptation from the F-80 day interceptor) was introduced into the continental air defense system as the first jet all-weather interceptor.

The strategic air command was reorganized to give each of its three air forces its own reconnaissance and bombing capabilities, enabling each to work as a separate organization in launching an immediate counterstroke when and if required. The continental air command (ConAC) was divided into three major air commands, ConAC retaining responsibility for the administration and training of the U.S.A.F. civilian components. The tactical air command had as its primary mission the development and training of tactical support aviation in conjunction with army field forces. The air defense command was to be responsible for air defense of the United States. The air force special weapons command was established for the field development and testing (within the areas of air force interest) of equipment and techniques relating to atomic energy. The air research and development command was established to provide increased emphasis on the qualitative improvement of the air force. Largely as the result of the spring exercise in the supply of large-scale operations entirely by strategic air lift, the mission of the military air transport service was revised. This service formed the nucleus of a trained military air transport service capable of necessary expansion, and gave priority to the mission of main-

taining the air transport capacity to meet the M-day aircraft requirements of the department of defense.

As an immediate result of the Korean conflict, congress passed legislation authorizing a 70-group air force, suspended the personnel ceiling and made supplementary appropriations increasing the military budget for fiscal year 1951 from \$13,000,000,000 to \$24,000,000,000. By the end of Sept. 1950 approximately 1,100 of the 2,800 rated officers previously removed from flying status were restored. Construction was expedited. There was a general acceleration of the program to meet increased defense needs, but the air force, in the second half of 1950, continued to emphasize the long-range program, especially in the field of research and development.

Significant progress was made during the year in the development of more modern types of aircraft and in the development of methods for extending the range of aircraft. The XF-91 interceptor was undergoing performance tests. The F-89 was the first jet aircraft accepted by the air force which was specifically designed as an all-weather interceptor. The F-86D was an all-weather interceptor version of the earlier F-86 day fighter.

The jet YF-93, the XF-88 and the XF-90, three new penetration fighters, were evaluated.

The F-84F was an improved version of previous F-84 models.

The XB-51, a light bomber with crew of two, was the first postwar bomber specifically designed for ground support work.

The XG-20 was a medium cargo assault glider, capable of being towed at a much higher speed than any operational gliders used in World War II.

The XC-120 medium transport was a detachable compartment version of the C-119, unique in its possibilities. It was designed to test the feasibility of detachable cargo compartments which could be preloaded for a variety of uses.

The C-124 heavy cargo transport represented a milestone in air transportation because of its capacity and adaptability.

An operational flight of the year was especially significant. On Sept. 22 two U.S.A.F. pilots, each flying an F-84 Thunderjet, took off from Manston, Eng., in a flight that made use of the drogue-probe refuelling system. Lieut. Col. William D. Ritchie was forced to bail out over Labrador, but Col. David C. Schilling completed the first nonstop transoceanic flight in a jet aircraft in 10 hr. 1 min.

On Sept. 29 Capt. Richard V. Wheeler established a new (but unofficial) high-altitude bail-out record in an experimental jump from an altitude of more than 8 mi. (42,449 ft.) in an automatic opening parachute.

The air engineering development centre authorized by the congress in Oct. 1949 to provide the military service, private institutions and industry with facilities for exploring the aeronautical field beyond the sonic barrier, which was under construction at Tullahoma, Tenn., was named the Arnold Air Engineering Development centre in honour of Gen. Henry H. Arnold, who died on Jan. 15, 1950.

By May 31, 1950, the total number of officers and airmen on duty in the U.S.A.F. had declined to 408,844. By the end of August command strength had been rebuilt to approximately 450,000 officers and airmen, with almost one-third of the total deployed overseas. As of the same date there were approximately 12,000 U.S.A.F. planes in active status. (H. S. Vg.)

**United States Navy.**—For naval aviation, as for other United States forces, the year 1950 was clearly divided down the middle. The first six months emphasized the continued effort to reach what was expected to be a permanent peacetime establishment. Then late in June a rapidly deteriorating international situation and the necessity for supporting United Nations forces in Korea caused an abrupt reversal. The navy concentrated on building

BOMBS BURSTING on an oil refinery at Wonsan, North Korea, during a raid by U.S. B-29s in Aug. 1950. More than 625 tons of bombs were dropped on the target area, a key industrial and coastal transport centre

up its aviation, including that of the marine corps, to meet any emergency.

Direct support of United Nations forces by the single United States fleet carrier then in the far east began within a few days of the opening of hostilities. By the end of the year a total of four fleet carriers and two escort carriers, the latter with marine corps squadrons aboard, had engaged in active operations. Naval patrol aircraft flying from land bases or supported by aircraft tenders conducted daily reconnaissance flights and antisubmarine patrols. The first marine air wing also operated from shore bases in Korea and Japan in support of United Nations ground forces. Transport squadrons of the navy and marine corps joined similar units of the air force in rushing men and equipment across the Pacific to meet the emergency.

New equipment and aircraft types, notably jets and new attack planes, received thorough test under combat conditions. Helicopters made their first appearance in combat with the marines and proved extremely useful in a utility role, carrying supplies to forward units and evacuating casualties.

The navy continued to press the design of improved jet-propelled fighter aircraft for carrier use. The AJ-1, a high-speed attack plane, went into service with fleet squadrons. Test flying was begun on a patrol plane (XP5Y) and a carrier plane

(XA2D), both powered by turbopropeller engines. Operational developments with helicopters and lighter-than-air ships showed great promise in the antisubmarine field. Equipment was devised for refuelling airships at sea and thus extending their usefulness in antisubmarine operations. Experiments with guided missiles aboard submarines and on the specially equipped U.S.S. "Norton Sound" were continued, and congress authorized the conversion of a cruiser to a guided-missiles ship.

The expansion of forces to meet the uncertain international situation began to show results in the last quarter of the year. There were three large "Midway"-class carriers and six fleet carriers in the active fleet. Among these was the U.S.S. "Oriskany," the first World War II type to be converted to handle the heavier aircraft which was in production and under development by 1950. Other conversions were to follow. About 3,400 officers and 24,000 enlisted men were added to the aeronautical organization of the navy and proportional increases occurred in marine corps aviation. Training of pilots was increased to produce about 1,500 yearly. At the end of the year the navy had about 13,700 aircraft in its inventory, of which 7,200 were in operating status, the remainder being assigned to logistic support or held in storage.

In addition to increasing the size of the aeronautical establishment and to the active operation in Korea, naval aviation continued to perform routine functions for the fleet. The naval aerological service, in addition to running the naval establishment, also, in co-operation with the weather bureau and air force, conducted research into aerological phenomena and assisted in furnishing a hurricane warning service which resulted in the saving of lives and property. Photographic squadrons were active in Korea and also conducted aerial surveys of value to the navy and to other agencies of government. Naval aircraft and other equipment were furnished to signatories of the North Atlantic treaty under the Mutual Defense Assistance program and a small number of foreign nationals were trained in their care and maintenance. (See also NAVIES OF THE WORLD.)

(J. H. C.)

**Air Forces of the World.**—In 1950 the world's air forces, both eastern and western, continued with the intensive development of advanced types of aircraft. The events of the summer, however, tended to shift the emphasis in all countries toward production. The rate of expansion came under security restrictions on both sides of the "iron curtain." Little was made known by governments about quantities of aircraft or the results of advanced research, but aircraft with and without pilots were undoubtedly improving in performance, and guided missiles could be assumed to be a major field for research in the larger nations. There was a strong trend toward the modification of existing types of military aircraft for tactical uses. Ground attack, photo reconnaissance, night fighter, all-weather and antisubmarine patrol duties called for tactical aircraft, and these were produced largely by the modification of existing designs.

The Atlantic pact became more realistic when the Mutual Defense Assistance program was put into effect during the latter part of the year. The program, calling for the expenditure of \$1,222,500,000, was expected to be half completed by Sept. 1951. More than \$1,113,000,000 of the funds were to come from the U.S. air force, and the rest from the navy and army.

Limited numbers of World War II piston-engined aircraft were scheduled to be transferred by the air force and navy to signatory nations, but it was expected that France and Italy would have 800 jet-powered Republic F-84 Thunderjets by the end of 1952, and about 500 North American F-86 Sabres would be in the British royal air force. A principal factor in the Mutual Defense Assistance program was the strengthening of European in-

dustry. Of \$475,000,000 intended for this purpose in 1951, \$110,000,000 was for the aircraft industry.

The licensing of U.S., British and Canadian aircraft and engines in France, Italy and other European countries continued in 1950. British Vampire and Meteor fighters were in use in more than 20 air forces, and British jet engines were being built in both hemispheres. Some of the aircraft involved in negotiations of 1950 were the Fairchild C-119 cargo plane, the Canadair DC-4M transport, the North American F-86 and possibly the Republic F-84 Thunderjet. The Canadian Avro Orenda jet engine seemed slated for production in several countries. The English Electric Canberra light bomber was to be built in Australia, and might be used in the United States in exchange for F-86 Sabres.

Standardization of types of aircraft for a United Nations air force, while by no means fully achieved, appeared to be on the way.

**U.S.S.R.**—Attention in the west was centred on the U.S.S.R. as the source of the war potential in the east. Aircraft and armament used by the Communist Chinese and the North Koreans were manufactured in the Soviet Union.

The soviet air force was placed under the soviet army in the reorganization announced in Feb. 1950. The army air organization consisted of a large force for the support of ground troops, an air defense force, principally of fighters, and a long-range air arm. The navy was equal to the army, under the reorganization, and its aircraft were administered as integral parts of the navy. The naval organization was similar to that of the army, and was reported to be entirely land based. The civil air fleet could be fitted into the military and naval picture during wartime, for logistic and other duties.

The U.S.S.R. undoubtedly had more troops, aeroplanes and submarines in service than any other nation. Western estimates placed the number of soviet first-line military aircraft in service at about 15,000. Plane production was estimated to be 7,000 planes per year early in 1950, and the country's capacity to produce planes was variously estimated at 40,000 to 50,000 planes per year. The U.S.S.R. was believed to have continued production after 1945 without the drastic cutbacks made in the west, at the same time emphasizing research on jet types, guided missiles and the atomic bomb.

At the annual parades in May each year new jet types were flown over Red square, and the Korean war brought the MIG-15 fighter into combat for Communist China. These fighters were also reported late in 1950 in numbers over Berlin and other soviet bases in Germany.

The Mikoyan and Gurevich MIG-15 was a swept-wing fighter powered by a centrifugal turbojet. Its speed was reported by U.S. pilots in Korea to be very high, particularly during bursts when power boost was used. The two standard advanced fighters in production in 1950 were the MIG-15 and the Lavochkin LA-17, both rated in the 685-m.p.h. class. With afterburning or other power boost, as in the case of the MIG-15 in Korea, they probably could travel at near-sonic speeds for short intervals. The Yakovlev YAK-17 fighter, also reported to be in production, was a third fighter using a centrifugal jet engine. It was first flown in 1947 and resembled the U.S. F-84 Thunderjet.

Earlier piston fighters such as the YAK-7 and YAK-9, reported used in Korea, the LA-7, LA-9 and LA-11 and the twin-jet MIG-9, were reported still in service in large numbers in 1950.

Bomber development in the U.S.S.R. was not emphasized up to about 1947. In World War II soviet bombers were typified by such twin-engined models as the Tupolev TU-2, Ilyushin IL-4 and the Petlyakov PE-2. Twin-jet prototypes were observed over Moscow in May 1950. The twin-jet TU-10 was an axial turbine-powered light bomber of 70-ft. wing span, estimated to be in

the 525-m.p.h. class. The IL-16 four-jet bomber, first seen in 1947, was of conventional design. The principal soviet bomber in service was the TU-4, generally considered to be a copy of the U.S. B-29. The IL-10 piston-engined Shturmovik was the standard ground support aircraft in all soviet-controlled air forces. Its maximum speed was 280 m.p.h. It was reported seen in numbers in Germany.

Rocket fighter development in the U.S.S.R. was based on the YAK-21 derived from the Messerschmitt Me-163 of World War II. It was reported capable of a climbing rate of 12,000 ft. per minute, and a top speed of 670 m.p.h., for a 15-20 minute duration. Compared with the British experimental Sapphire-powered Meteor, which climbed 40,000 ft. in less than three minutes and had a much longer operational duration, the YAK-21 did not seem practical.

*Soviet Jet Engines.*—Soviet engine design showed in 1950 a trend toward more powerful axial-flow types, corresponding to the trend in the west.

The axial-flow turbojet designs taken over by the U.S.S.R. from Germany in 1945 were developed slowly by soviet and German engineers, without conspicuous success for the first several years after World War II. The best of the soviet production fighters in 1950 were using centrifugal turbojets based on the Rolls-Royce Nene and Derwent engines sold to the U.S.S.R. in 1947. Later aircraft going into production were reported to be equipped with axial-flow types.

The German BMW-003 and BMW-018 and the Jumo-004 were the basic designs for the later soviet turbojets.

In a case probably typical, the original Jumo-004 was increased in size and number of stages, first in Germany and then in the U.S.S.R., and eventually became the M-012. The latest version in 1950 was reported to develop 7,700 lb. thrust at a dry weight of 4,850 lb. Compared with the latest British axial-flow type, the Armstrong Siddeley Sapphire, producing 7,200 lb. thrust for 2,500 lb. dry weight, the huge M-012 was not impressive. Fuel and oil consumption rates of soviet axials were reported consistently higher than those of comparable British and U.S. engines. It could be assumed, however, that soviet engines were consistently improving, and that research and development on other jet types, afterburning and guided missiles were going at full speed. Power boost of some sort was known to be very effective in accelerating the MIG-15 fighter in Korea. Unconfirmed reports of soviet jets producing more than 12,000 lb. thrust were current in Germany.

Soviet development of rocket engines was continuing. The R-509C, based on the German Walter HWK-509C, was the principal engine of this type.

**Great Britain.**—Aircraft and engine production became a problem of first importance during 1950 as plans for the defense of the British commonwealth and the North Atlantic treaty nations took form. Production began to increase in July, and by November Prime Minister Clement R. Attlee announced that orders for aircraft for the first two years of a three-year defense plan had been placed.

*Farnborough Show.*—The display at Farnborough of the Society of British Aircraft Constructors, held in Sept. 1950, again showed excellent results of intensive research and development on gas turbine-powered tactical, defense and transport aircraft. New bombers in the medium and heavy classes were again lacking, and heavy bombers above 150,000 lb. loaded weight were not planned, though some projects in the 150,000-lb. medium class and lighter were reported progressing toward the prototype stage. Vickers-Armstrongs Ltd. was said to be leading in the medium jet bomber field, and others reported in progress were the Handley Page tailless jet bomber and a Bristol light jet bomber. Delivery of new jet bombers by the middle of 1951 was antici-

pated at the end of 1950.

Two sonic fighters attracted attention at the show. The Vickers Supermarine swept-wing 535 was described as Britain's fastest aeroplane and the first British interceptor to fly at supersonic speeds. Close behind and reported superior in manoeuvrability was the Hawker P.1081, previously flown at London and Antwerp in June. The P.1081 had all swept surfaces. Both aircraft were powered by single Rolls-Royce Nene turbojets.

Night fighters shown included the Gloster Meteor NF.2, the English Electric Canberra 2 and the de Havilland Venom N.F.2, all of which had been ordered in quantity. The Venom N.F.2 was a carrier-borne fighter having a crew of two, designed for both all-weather and night fighter duties. The Canberra 2, with its two Rolls-Royce Avon turbojets, impressed observers with its performance as its predecessor had in 1949, and was scheduled for light bombing and ground attack as well as night fighter duty. In addition to the English Electric Company, Ltd., Handley Page Ltd., Short Brothers & Harland Ltd. and A. V. Roe & Co., Ltd., were manufacturing this aeroplane.

Transition of the royal navy to jet-powered equipment was well begun in 1950 with quantity orders for the Vickers Supermarine Attacker and the Hawker Sea Hawk jet fighters, and the Westland Wyvern turbine-propeller strike fighter. New antisubmarine types shown at Farnborough included the Blackburn and General Y.B.1 and the Fairey 17, both powered by coupled Armstrong Siddeley Mamba turbine-propeller engines, and the Short Brothers & Harland SB-3, powered by two Mambas. The SB-3 was a version of the Sturgeon reconnaissance bomber and naval target tower, with an underslung nose for radar equipment, and was the first aircraft using gas-turbine power to be built by Short Brothers & Harland.

*British Jet Engines.*—More powerful axial-flow turbojets was the keynote of engine development. No new centrifugal types and no new turbine-propeller types were reported. The outstanding new turbojet engine at Farnborough was the Armstrong Siddeley Sapphire, an axial-flow type having a static thrust of 7,200 lb. at sea level. An experimental Gloster Meteor powered by two Sapphires was reported to climb 40,000 ft. in less than three minutes. The Rolls-Royce Avon, at 6,000 lb. thrust, a multistage axial type, was also flown at the show in a two-engined Meteor. A later development of the Avon, reported at 10,000 lb. thrust, was not shown. The turbojet version of the Armstrong Siddeley Mamba, the Adder, developing 550 lb. thrust, and the de Havilland centrifugal Ghost, with afterburning, were other turbojets shown. The Canadian Avro Orenda, an axial-flow turbojet rated at 6,000 lb. thrust, was reported in quantity production at home and under strong consideration for production under licence by several European countries.

The Fairey Beta two-cylinder rocket motor, which had been flown in an experimental plane, was shown at Farnborough for the first time.

*Experimental Aircraft.*—Experimental types at Farnborough included the Avro 707B delta-wing research plane, a second version of the subsonic 707 shown in 1949. Six 707Bs were reported ordered. This was the first of a planned research series intended to investigate the delta wing at all speeds, for its suitability as a bomber wing. The Nene-powered Boulton Paul P.111, not shown at Farnborough, was first flown in October. It was designed for trans-sonic speeds. Both the 707B and the P.111 were equipped with antispin parachutes. The third in this planned series would be the high-speed Fairey delta wing, possibly with a rocket engine.

The third prototype of the Saunders-Roe jet flying boat was undergoing flight tests late in 1950, after a period of inactivity. The Avro Ashton, powered by four Nene 5s, was first flown in August, and was intended for high-altitude research in both

Upper left: CONVAIR XP5Y-1, U.S. navy turboprop flying boat designed for long-range search-rescue missions and antisubmarine warfare, shown during its maiden flight in 1950

Upper right: BOEING B-47A STRATOJET, a U.S.A.F. bomber, being test-flown in 1950. The swept-wing plane had a bomb capacity of more than 20,000 lb. and a top speed exceeding 600 m.p.h.

Above, left: THE HAWKER P.1081, British jet plane powered by a single Rolls-Royce Nene turbojet engine, which made its initial flight in June 1950

Above, right: SWEDISH SAAB-29, trans-sonic jet fighter which was in quantity production in 1950; it was one of the few jet fighter planes designed and built outside of the U.S. and the British commonwealth

Right: CHANCE-VOUGHT F7U-1, U.S. navy fighter plane powered by twin-jet engines

Below: DOUGLAS C-124A GLOBEMASTER II, U.S. air force transport placed in military service in 1950; it had a self-contained loading ramp and carried as many as 200 soldiers and their field equipment

aerodynamics and engines for design data on fast heavy military and civil aircraft.

Other British experimental aircraft in various design stages, besides the jet bombers already mentioned, were Fairey and Gloster jets, a de Havilland twin-jet and the de Havilland Comet with axial jets.

**Canada.**—The Canadian-designed front-line fighter, the all-weather Avro CF-100, was first flown in Jan. 1950, powered by two Rolls-Royce Avon turbojets. The royal Canadian air force ordered ten of these in 1950, which would probably be powered with the successful Canadian Avro Orenda axial turbojet. Negotiations were reported under way for the manufacture of the Orenda in several European countries.

The Avro C.102 Jetliner attracted wide attention in its flights in 1950.

**Australia.**—A small jet research plane, designed and built entirely in Australia, was reported late in 1950. It was described as an ultimate guided missile for fighter and anti-aircraft training, capable of very high speed and rapid rate of climb to high altitudes. The Armstrong Siddeley Adder, the turbojet version of the Mamba, was used in the prototype, which was flown by a pilot. The pilotless radio-controlled version would be powered by the Viper, an expendable version of the Adder, delivering 1,500 lb. thrust. Specifications for this project were supplied by the ministry of supply and by Australian engineers.

The twin-jet long-range Australian fighter reported in 1949 to be under development at a cost of £5,000,000 was expected to reach the prototype stage late in 1950. It would have all swept-back surfaces. The Rolls-Royce Tay turbojet, which would be manufactured in Australia, was expected to furnish its power.

Production was begun on the de Havilland Drover, designed as a light civil transport for Australian flying, but capable of use as a military freighter or an ambulance. It would eventually be powered by the Australian designed Cicada seven-cylinder engine, which was expected to go into production late in 1950.

**France.**—The best military aircraft made in France in 1950 were the de Havilland Vampire and the Dassault M.D.450 Ouragan (Hurricane). One was a British fighter being built in France under licence, and the other was developed by a private aircraft company. The emphasis in France was upon defensive interceptors. There was no large production on bombers, no flying delta-wing research planes and little activity in missiles. The Rolls-Royce Nene, built under licence, was the only production turbojet. Production on the more powerful Rolls-Royce Tay was scheduled for 1951.

Aside from the Vampire, the French air forces and navy were equipped mostly with aircraft from World War II surplus, to which U.S. jet aircraft were added late in 1950.

The constantly shifting political situation in France produced plan after plan after 1945, and few tangible results for aircraft. Private companies outnumbered nationalized companies more than three to one in 1950, and were more active in both aircraft and engine development. The greater part of the military aircraft and jet engine work was still in nationalized hands, but such companies as Dassault, Breguet and Leduc were producing, developing or experimenting with aircraft of military significance.

The Dassault Ouragan, in the 525-m.p.h. class, was in quantity production and showed promise of meeting front-line aircraft requirements when fitted with the Rolls-Royce Tay turbojet. No data were available on the later M.D.452 interceptor. Breguet was developing a single-jet naval strike fighter in addition to civil and military transports and helicopters. Leduc continued work with the interesting O.10, the only man-carrying ramjet aeroplane in the world. Among the aircraft first flown in 1950 were the Fouga acrobatic glider and its advanced trainer,

the Breguet Mercure cargo plane, the Starck primary trainer and the Morane-Saulnier transport. The Fouga C.M.88 Gemeaux was the latest of this company's jet light planes, to be fitted with two new Turbomeca Piméné turbojets early in 1951.

Among the nationalized company projects, the Sud-Ouest S.O.4000 twin-jet swept-wing bomber was reported ground tested. Production was reported planned on the S.O.4000 and the S.O.-6020 Espadon (Swordfish) fighter, probably in one of its later versions first flown in Dec. 1949. Few first flights were reported in 1950 of nationalized company projects. The Nord 1601 research plane using two Derwent turbojets was reported early in the year, as was the Sud-Est 3110 civil helicopter.

There was no series production of French jet engines in 1950. The Hispano-Suiza company carried out the only active production, under Rolls-Royce licence. The French axial turbojets developed by Rateau and Aeroplanes G. Voisin (ATAR) from German designs compared favourably in weight-thrust ratio with U.S. and British axials. The ATAR 101B produced 4,850 lb. thrust, and the Rateau SRA-101, 7,275 lb. thrust. The nationalized S.N.E.C.M.A. worked closely with both the ATAR and the Rateau group, and was the manufacturing company for ATAR turbojets. S.N.E.C.M.A. announced its TB.1000 turbine-propeller unit in 1950, rated at 1,300 s.h.p.

**Italy.**—The importation of de Havilland Vampire fighters indicated how the Italian air force would replace some of its World War II surplus British and U.S. planes with new jet-powered equipment. Tooling was reported progressing late in 1950 for the production under licence of Vampire and Venom aeroplanes and Ghost and Goblin turbojets.

The Italian air force and aircraft industry could look forward to help from the Mutual Defense Assistance program in the form of aircraft, manufacturing licence agreements and aid to the industry in re-establishing itself.

The Italian aircraft industry's activity in arranging for the licensed manufacture of aircraft and engines was accompanied by design and development work on transports, light planes, trainers and fighters. Breda and Savoia-Marchetti transports, Fiat and Abrosini trainers and ventures into jet propulsion by Caproni and Fiat were the principal developments as of the end of 1950.

The Caproni Ca.195 attracted most attention in the west. It was described as a conventional modern fighter, having a slightly swept-back leading edge, powered by two axial-flow turbojets producing 2,000 lb. thrust for a maximum speed of 565 m.p.h. at 20,000 ft. The Fiat F.80 two-seat jet trainer would be powered by a de Havilland Ghost turbojet.

**Other Countries.**—According to the trend of 1950, air forces of the Atlantic pact nations and nations friendly to the west would be equipped largely with U.S. and British military aircraft, by purchase or by licensed manufacture. Soviet satellites would be largely supplied from the U.S.S.R. Construction of successful jet aircraft and engines was, however, in progress outside the U.S. and the United Kingdom. The Saab Aircraft company, supplier of numerous aircraft to the Swedish air force, was reported developing a successor to its J29 jet fighter of 1948. It was thought that the engine for this plane might be the new axial-flow turbojet of the STAL and Svenska Flygmotor companies, producing about 4,800 lb. thrust.

In the Netherlands, the Fokker Derwent-powered S.14 advanced trainer was reported nearing completion, and the S.13 twin-engined advanced trainer prototype was flown early in the year. This company was also manufacturing Gloster Meteor fighters for both the Netherlands and the Belgian air forces, and Hawker Sea Fury fighters for the Dutch navy.

From the Argentine, development was reported of the I.Ae.33 Pulqui II fighter, a swept-wing version of the first Argentine

jet aeroplane of 1947. (See also AIRCRAFT MANUFACTURE; AIRPORTS AND FLYING FIELDS; AVIATION, CIVIL; CIVIL AERONAUTICS ADMINISTRATION; JET PROPULSION; MUNITIONS OF WAR.)

**Bacteriology.** During 1950 the major part of effort and money spent on the manufacture of all ethical drugs was devoted to research and production of antibiotics derived from microorganisms. Fermentation products resulting in purified antibiotics were valued at \$250,000,000—second only to the value of fermentation alcohol—while vitamin production remained in third place. Another product of microbial growth reaching new production heights was citric acid.

Vitamin B<sub>12</sub> simultaneously produced with streptomycin had proved of great value in the treatment of pernicious anaemia. Maximum stimulation of haematopoiesis occurs when folic acid, a bacterial metabolite, is administered with vitamin B<sub>12</sub>. It appears that both substances are produced by bacteria residing in the intestines normally, and defective absorption may result in deficient blood formation. A growth-stimulating substance present in aureomycin concentrates produced by *Streptomyces aureofaciens*, identified as "animal protein factor," was an entirely new entity in the field of fermentations. Consumption of this factor by poultry and swine results in 20% greater growth with unusually high meat quality. It also increases the vigour and growth of calves.

It was believed that the discovery might revolutionize the preparation of manufactured feed for animals and poultry and create a new industry for producing the factor.

Among the many antibiotics which inhibit the growth of numerous bacterial and viral species, few had shown any significant action on pathogenic or nonpathogenic fungi. Actidione, produced by *Streptomyces griseus* along with streptomycin, is an exception in that it inhibits the growth of many common fungi. Its toxicity to animal tissue prevents its use as a therapeutic agent in mycotic infections. However, its practical use in the prevention of the growth of mould contaminants on agar plates had been demonstrated. Suppression of mould contaminants is especially important when relatively slow-growing bacteria are involved. Concentrations of 0.1 g. per litre do not influence the growth of bacteria adversely, but uniformly inhibit the growth of most common fungi and yeasts. Actidione is not inactivated by ingredients of bacteriological media, is heat-stable and water-soluble.

Urgent problems still under investigation in 1950 included the discovery of better antibiotics for treatment of tuberculosis, others for the wider control of virus diseases, especially poliomyelitis, and a more complete understanding of bacterial metabolites which inhibit growth of tumour or cancerous tissue.

**Immunity in Syphilis.**—Laboratory studies of immunity phenomena in syphilitic infections had become more practical with the development of an *in vitro* method for demonstrating specific antibodies against *Treponema pallidum*. Hitherto, only clinical observations on susceptibility or resistance of cured individuals to reinfection by the spirochete of syphilis had yielded meagre evidence on immunological characteristics of the disease. A substance present in blood of infected individuals, called reagin, had been of inestimable value in the serological tests for diagnosis of syphilis, but reagins are not true antibodies in that they offer no protection and are of little value in the study of immunological mechanisms. Spirochetes causing syphilis are

A. C. BRAUN, of the Rockefeller Institute for Medical Research, who received the highest annual award of the American Association for the Advancement of Science on Dec. 31, 1949, for his study of the initiation and growth of plant tumour caused by the crown-gall bacterium

motile organisms possessing flagella which were demonstrated by electron microscopy and later by flagellar staining technique. A protective antibody, which has an immobilizing effect on *Treponema pallidum*, appears in the sera of experimentally infected and treated animals. The level of immunity is directly correlated with the immobilizing power of the serum. Disclosure of these data offered for the first time a research tool for more detailed studies of syphilis immunity in man.

**Antibiotic Resistance and Dependence.**—The development of resistance of many bacteria to streptomycin had been demonstrated both experimentally and in the course of therapy in human infections. Whether this is a result of natural selection according to Darwinian principles with survival and overgrowth of resistant individual cells, or the outcome of acquired resistance in the manner of Lamarckianism was still being debated in 1950. The ultimate in this tendency of the bacterial organisms to withstand streptomycin was reached when it was reported that many bacteria actually become streptomycin-dependent and fail to grow in its absence. Similar phenomena were also observed with one of the newer antibiotics. Chloramphenicol resistance and dependence were shown for *Klebsiella pneumoniae*, and bacitracin resistance was observed to develop in many strains of beta haemolytic streptococci. Since these antibiotics had already enjoyed rather extensive clinical use the isolated reports lent support to the view that the newer antibiotics would not lead to frequent development of resistant strains of pathogenic organisms as had been the common observation in streptomycin therapy.

**Poliomyelitis.**—Stimulated by funds from the National Foundation for Infantile Paralysis, research was extended during 1950

into fundamental aspects of the disease. Intracellular as well as cytoplasmic parasitism had been discovered. Competition between the virus and the nerve cell for essential nucleoproteins formed within the nucleus might explain the damage to nerve cells and resultant paralysis of muscles when the virus succeeded in obtaining the major portion of available nucleoproteins. Likewise when nucleoprotein was depleted in the nerve cell as a result of physical fatigue, an invading poliomyelitis virus might appropriate what little nucleoprotein remained and bring about cell starvation and death. Severe poliomyelitis had been observed to occur in fatigued individuals.

Attempts to develop a vaccine for poliomyelitis had been thwarted by difficulties encountered in cultivating the virus in sufficient quantity and by the existence of many unrecognized immunologically distinct strains of the virus. A report on the successful propagation of the virus in a test tube on human placental tissue might be an important step toward removing mysteries surrounding the disease and might facilitate attempts to produce a vaccine. Likewise the isolation of strains in addition to the three previously reported should be more readily accomplished. A vaccine to be successful must have immunizing potentialities against all strains of the virus. Some hope from the new data was extended to the use of ultra-violet irradiation to attenuate the virus for purposes of vaccine production as had been done so successfully with the rabies virus. That a vaccine would be discovered for active immunization against poliomyelitis seemed a foregone conclusion since recovery from the disease results in a high immunity and a majority of adults are immune, probably because of inapparent mild infection with a relatively impotent virus. The problem was to reproduce in the laboratory under more controlled conditions what already occurs naturally.

Experimental evidence disclosing a milk-borne immunity against certain virus diseases including poliomyelitis had been discovered. Animals reared by immunized foster mothers exhibited great resistance to subsequent experimental injections of poliomyelitis virus while litter mates reared by nonimmune foster or natural mothers succumbed. A virucidal antibody was demonstrated in the milk of immunized mothers which was not present in those not vaccinated. This disclosure lent further argument to the generally accepted fact that maternal milk for an infant is highly desirable since most adults are immune to many diseases and corresponding antibodies appear in the mother's milk. (See also EPIDEMICS.) (M. V. N.)

**Badminton.** Marten Mendez of San Diego, Calif., captured the national senior men's title in 1950 for the second year in a row, by turning back Joseph Alston, also of San Diego, in the championships played at Baltimore, Md. It marked the second straight season these two hard-hitting Pacific coast stars had met in the final round. After annexing the opening set handily, 15-6, Mendez was checked, 15-11, in the second. Playing cautiously, the finalists alternated in leading in the deciding chapter until Mendez ran off 5 straight points for a 15-10 victory and the match.

Ethel Marshall of Buffalo, N.Y., had an easier time in annexing the senior women's crown for the fourth successive season, conquering Mrs. Thelma Scovil of San Diego, 11-6, 12-10, in the tourney finale. Wynn Rogers of Glendale, Calif., and Barney McCay of Alhambra, Calif., repeated their triumph of the previous year in the men's doubles when they halted the challenge of Clinton Stephens of Baltimore and Bob Williams of Buffalo, 15-5, 15-10, while Mrs. Scovil and Janet Wright of San Francisco retained the women's doubles laurels by stopping Mrs. Clinton Stephens of Baltimore and Zoe Yeager of Seattle, Wash., 18-17, 15-7. Rogers and Mrs. Hulet Smith of Los Angeles again scored in the mixed doubles.

In the fourth annual national junior tournament at Boston, Mass., Judy Devlin, a 14-year-old Baltimore star, defeated Evie Talley, also of Baltimore, 11-4, 11-5, to keep the girls' crown. Steve Hinchcliffe of Hermosa Beach, Calif., won the boys' prize, defeating Peter Sherwood of Westport, Conn., 18-15, 15-4.

Miss Devlin paired with Deedy McCormick of Westport to take the girls' doubles honours. They subdued Miss Talley and Sandra Dailey, another Baltimore entry, 15-4, 15-8, in the concluding round. The boys' doubles went to Manuel Armendariz of Burbank, Calif., and Hinchcliffe, while Ronnie Ryan of Berkeley, Calif., and Miss Devlin triumphed in the mixed doubles.

**Baguio Conference:** see FAR EASTERN UNITY.

**Bahamas.** This British colony consists of an archipelago of about 700 islands, of which New Providence is the most important, outside the Gulf of Mexico and off the coast of Florida. Area: 4,375 sq.mi. Pop. (1949 est.) 78,000. Capital: Nassau. Governors: (1950) Sir George Ritchie Sandford and, from Dec. 7, Maj. Gen. R. A. R. Neville.

**History.**—Butlin's vacation village at West End, Grand Bahama, opened early in 1950, and the colony experienced a record tourist season as a result. An agreement was signed permitting the U.S. jointly with the United Kingdom to establish and operate technical and supporting facilities at selected sites in the colony for a guided-missile range to be known as the Bahamas long range proving ground. The Colonial Development corporation announced that it had launched an agricultural undertaking to make the colony to a large extent self-supporting in food; the capital authorized up to October, including the purchase of the land and buildings on Eleuthera, was £1,034,000.

**Finance and Trade.**—Currency: pound sterling; U.S. currency is also generally accepted. Budget: revenue (1950 est.) £1,315,760; expenditure (1950 est.) £1,649,573. Foreign trade (1949): imports £4,775,789; domestic exports £488,365; re-exports £172,448. The economy of the colony was primarily dependent on the tourist industry. (Jo. A. HN.)

**Baltimore.** Baltimore is the metropolis of Maryland and had a population of 940,205 in 1950 (preliminary census). The land area of the city is 78.72 sq.mi.; the water area, 13.21 sq.mi. Mayor: Thomas D'Alesandro, Jr., Democrat.

Budget appropriations for 1951 were \$141,236,789.76; for 1950, \$122,620,039.97. The city tax rate for 1951 was \$2.62 per \$100 of assessed valuation and the rate for 1950 was \$2.88. The taxable basis for 1951 was \$2,441,210,616 and for 1950 it was \$2,327,049,041. The gross funded debt as of Nov. 30, 1950, was \$203,179,900; the sinking funds amounted to \$43,460,799.50, leaving a net debt of \$159,719,100.50 as of Nov. 30, 1950, not including accrued income. The percentage of net debt to the taxable basis (excluding self-supporting indebtedness) was 4.12% for the year 1950.

The net enrolment on Oct. 31, 1950, in the public schools of the city was 77,779 white students and 40,948 Negro students; and, in addition, 11,006 white and 4,399 Negro students were enrolled in adult education classes. William H. Lemmel had been superintendent of the Baltimore city schools since July 1946. The public schools of Baltimore are a separate and distinct unit, and are not under the jurisdiction of the state department of education.

Ranking as the second United States port in foreign-trade tonnage, the combined exports and imports at the port of Baltimore during the year 1949 amounted to 17,001,355 tons, an increase of more than 400,000 tons over the previous year. Domestic coastwise and intercoastal shipments and receipts amounted to 7,422,687 tons for the year 1949.

Manufacturing activity in the Baltimore area during 1950 receded slightly from that of 1949. During the first nine months of the year, employment in manufacturing averaged approximately 161,800, representing a decrease of nearly 1,000 from the similar period of 1949. The leading industries, based upon the volume of employment, included iron and steel products, shipbuilding and repairing, aircraft, communications equipment, men's clothing, bakery products, beverages, metal stampings, tin containers and meat products. Total nonagricultural employment, exclusive of self-employed, domestic servants and unpaid family workers in the January–September period of 1950 averaged about 464,000, an increase of more than 3,000 over the first nine months of the previous year.

**Bananas:** see FRUIT.

**Banking.** Banking developments in the United States during 1950 were dominated by the gradual rise in business activity during the first part of the year, the sharp upswing in demands for credit after the outbreak of the Korean war and efforts to restrain inflationary credit expansion. New all-time records were set in many banking activities, such as total loans and investments of commercial banks, total loans, total privately-held money supply, home mortgage indebtedness and consumer credit outstanding.

In 1950 the privately-held money supply, which includes total bank deposits, other than interbank and United States government, and currency outside banks, rose by \$6,400,000,000 to reach a new all-time high level of about \$176,200,000,000 at the end of the year. Most of the increase was in demand deposits adjusted, in contrast to the preceding year when such deposits had shown little change. Currency outside banks declined another \$200,000,000. Time deposits in commercial banks, mutual savings banks and the postal savings system rose about \$300,000,000 during the year, with sharp withdrawals during July, August and September being more than offset by net gains later in the year.

Factors responsible for the renewed increase in the privately-held money supply to a new peak included an increase of \$11,300,000,000 in loans of commercial and mutual savings banks and an increase of \$1,900,000,000 in holdings by such banks of state and local government obligations. These factors were offset in part by a decrease in holdings of United States government securities by the banking system amounting to \$3,900,000,000, by a decrease during 1950 in the gold stock of \$1,600,000,000 and by other factors. Almost all of the increase in the money supply came about in the second half of the year.

The year saw such large expansion in private bank credit that several new all-time peaks were reached by Dec. 31, 1950, in earning assets of all commercial banks. Total loans and investments reached a new record high of \$127,200,000,000, an increase of \$7,000,000,000 during the year. Total loans of all commercial banks rose almost \$10,000,000,000, to a new peak of \$52,700,000,000. Holdings of other securities reached an all-time high of \$12,200,000,000, after an increase of \$2,000,000,000. Holdings of United States government obligations by all commercial banks declined \$4,700,000,000 and stood at \$62,300,000,000 at the end of the year.

The sharp increases in total loans and in holdings of state and local government and other securities continued the basic changes

which had been under way since the beginning of the postwar period in the pattern of earning assets held by commercial banks. By Dec. 31, 1950, commercial bank earning assets other than United States government securities exceeded commercial bank holdings of government securities.

On June 30, 1950, national banks, which numbered almost 5,000, held \$82,400,000,000 of total deposits. State banks, which numbered somewhat more than 9,000, had total deposits of \$61,400,000,000.

An act of congress, approved Sept. 21, 1950, increased the legal maximum of insurance for each depositor to \$10,000 from the previous \$5,000. A study by the Federal Deposit Insurance corporation (*q.v.*), released early in the year, indicated that on Sept. 30, 1949, the 13,440 insured commercial banks reported 91,000,000 accounts with total deposits of \$139,000,000,000. About 88,000,000 accounts, or 96% of the total number, were fully protected under the \$5,000 maximum coverage per depositor, while the insured deposits amounted to \$62,000,000,000 or 45% of total deposits. The study showed that as of Sept. 30, 1949, there were about 2,250,000 accounts of between \$5,000 and \$10,000, and that additional insured deposits with a coverage of \$10,000 amounted to \$10,600,000,000.

Consumer credit expansion played a very important role in business developments during the year. By Dec. 31, 1950, total consumer credit reached an all-time peak of about \$20,000,000,000, an increase of \$3,200,000,000 from the end of Dec. 1949. The rise in automobile sale credit and in instalment sale credit for the purchase of other durable consumer goods dominated the expansion. Instalment credit outstanding rose at a record rate during the third quarter of 1950, when buying of consumer durables reached extraordinary heights, but levelled off in the fourth quarter, as the anticipatory buying of durable goods slackened and federal reserve restrictions on consumer credit took hold. In November, for instance, consumer instalment credit outstanding declined an estimated \$74,000,000 as compared with increases of more than \$300,000,000 in each month of the period May through September of 1950. (See also CONSUMER CREDIT.)

Housing credit terms were tightened in the second half of the year. Under authority granted by the Defense Production act, in October the federal reserve issued regulation X which prescribed minimum down payments and maximum loan maturity periods for new conventionally financed one- and two-family houses, with the severity of the terms increasing progressively with the price of the house. The same terms, with some preference for veterans, were applied to new and existing houses insured by the Federal Housing administration and guaranteed by the Veterans' administration. (See also HOUSING.)

Corporate security issues for new capital decreased in 1950 as compared with the preceding year, but nevertheless remained at a high level. Increased availability of funds from internal sources reduced the need for external financing. Private placement of securities continued to be important, accounting for an estimated 40% of all corporate financing in the first nine months of the year.

New state and municipal financing in 1950 reached a new record. The outlook for increased taxes kept municipal bond prices strong. In the November elections, voters evidenced less willingness to approve proposed state and local government bond issues than a year before.

The decline in the U.S. gold stock, which had started after devaluation of the British pound and other currencies in Sept. 1949, continued at an intensified rate. At the end of Dec. 1950, the gold stock stood at \$22,800,000,000, about \$1,900,000,000 less than the all-time high of about \$24,700,000,000 reached just before devaluation of the pound. Most of the gold sold net by the United States to foreign countries was held earmarked for

the account of foreign monetary authorities at the federal reserve bank of New York, where gold under earmark for the account of foreign central banks and international institutions amounted to more than \$5,600,000,000 on Dec. 29, 1950, compared with \$4,000,000,000 on Sept. 30, 1949. The accelerated United States gold sales reflected in part a more rapid conversion into gold of dollar balances acquired by foreign nations, but chiefly the more rapid acquisition of dollars by foreign countries which resulted from the sharp increase in United States imports at very high prices subsequent to the outbreak of the war in Korea. (See also GOLD.)

During 1950 as a whole the gross federal debt declined by about \$400,000,000 to \$256,700,000,000 on Dec. 31, 1950. Total marketable obligations were reduced by \$2,700,000,000. The amount outstanding of treasury notes rose sharply and that of certificates of indebtedness and marketable bonds fell, reflecting issuance of notes for certificates and bonds in exchange operations. Nonmarketable public issues outstanding continued to rise, with increases of \$1,300,000,000 in United States savings bonds of all series including accrued discount and \$1,000,000,000 in treasury savings notes. Redemptions of series E savings bonds exceeded sales after May, however, and growing attention was being given to the problem of refunding the series E bonds when they start maturing in May 1951. Special issues, held by government trust funds and corporations, rose during the year by \$700,000,000. (See also DEBT, NATIONAL.)

The volume of bank debits of the banks in 333 reporting centres reached another high level in 1950. The annual rate of turnover of demand deposits, except interbank and government, showed a substantial increase, from 27.3 in Oct. 1949 to 30.7 in Oct. 1950 for New York city banks, and from 18.5 in Oct. 1949 to 20.9 in Oct. 1950 for banks in other leading cities. The increase in velocity of circulation of the privately-held money supply as well as the increase in the quantity of deposits and currency financed the post-Korea increase in money expenditures throughout the economy. (See also BUSINESS REVIEW; EXPORT-IMPORT BANK OF WASHINGTON; FEDERAL RESERVE SYSTEM; INTERNATIONAL BANK FOR RECONSTRUCTION AND DEVELOPMENT.) (J. K. L.)

**Mutual Savings Banks.**—For the year ended July 1, 1950, assets of the mutual savings banks in the United States increased \$1,180,947,148 or 5.6% to a total of \$22,293,089,195, and deposits increased \$991,292,834 or 5.2% to a total of \$19,939,312,945. In the year ended July 1, 1949, the increases were \$849,184,942 or 4.2% and \$738,588,044 or 4.1% respectively. On July 1, 1950, the combined surplus was \$2,209,947,477, equivalent to 11.1% of deposits. On July 1, 1949, the combined surplus was \$2,062,634,259, or 10.9% of deposits. Accounts increased 1.8% or 345,115 to a total of 19,531,373 as of July 1, 1950. In the fiscal year 1949 the gain was 432,579 or 2.3%. In 1950 the average rate of dividends paid was 1.97% compared with 1.90% in 1949.

On Dec. 1, 1950, there were 529 mutual savings banks with 212 branches in operation. There was a decrease of 2 banks and an increase of 14 branches during 1950.

The combined assets of all mutual savings banks on July 1, 1950, were invested as follows: U.S. government securities 51.91%; other securities 10.91%; mortgage loans 31.82%; cash and other assets 5.36%. On July 1, 1949, the investment classification was: U.S. government securities 55.22%; other securities 11.21%; mortgage loans 28.18%; cash and other assets 5.39%. Despite the decrease in U.S. government securities owned as a percentage of total assets, the savings banks were, next to the commercial banks and life insurance companies, the largest private group holding United States government securities.

Forty-four per cent of all new real estate mortgage loans made, and 30% of all such loans outstanding, were Federal Hous-

ing administration or Veterans' administration insured loans. The volume of new loans made during the year was double in amount the net gain in the amount of real estate mortgage loans outstanding. The excess was required to offset the large volume of current amortization payments which resulted from the systematic efforts to place conventional as well as insured mortgage loans on a regular amortizing basis.

**Savings Bank Life Insurance.**—At the end of Oct. 1950 there were 259 savings banks in the states of Connecticut, Massachusetts and New York selling savings bank life insurance; of these 82 were issuing banks and 177 were agency banks. The amount of savings bank life insurance in force and number of policies represented were: Connecticut \$14,015,028 in force, representing 14,772 policies; Massachusetts \$392,869,673 in force, representing 423,345 policies; and New York \$171,752,816 in force, representing 124,445 policies. Combined there was \$578,637,517 in force, representing 562,562 policies.

**British Trustee Savings Banks.**—Total deposits in the trustee savings banks in Great Britain exceeded £1,000,000,000 at the close of the fiscal year, Nov. 20, 1950, an increase of more than £58,000,000 during that year. Since the end of World War II the growth in deposits had averaged £60,000,000 a year. The latest complete financial report released was as of Nov. 20, 1949. On that date there were 85 separate banks operating 1,065 offices. (HE. BR.)

**Great Britain.**—The approximate stability in the credit framework established through Sir Stafford Cripps's disinflation policy in 1947-48 was fully maintained during the first part of 1950, the rising trend of import prices being neutralized by higher productivity. Bank deposits reflected fully the downward pressure normally exerted in the early part of the year by the movement of tax money into the exchequer: the decline between January and June in the deposits of the London clearing banks was nearly £100,000,000 more than in 1948. In the second half of the year, however, a rise in internal prices caused mainly by developments overseas produced a marked distortion of the credit structure. This, aided by an extensive movement of so-called "hot" money into London, inspired by talk of a possible revaluation of sterling, caused a sharp expansion in the volume of bank resources. Deposits after deduction of "balances in course of collection" were approximately £140,000,000 higher in 1950 than in 1940.

Eleven London Clearing Banks  
(£ million)

	Oct. 1948	Oct. 1949	Oct. 1950
Deposits . . . . .	6,040	6,050	6,204

Advances . . . . .	1,355	1,466	1,598
Acceptances, etc. . . . .	243	261	346

The switch in bank lending from the governmental sector to the private sector of the economy, in progress throughout 1949, was vigorously continued in the first half of 1950. In the five months to the end of May the rise in bank loans to industry and commerce was the largest in British banking history. Over the same period, extensive repayment of official indebtedness to the banking system found a reflection in a sharp net decline in the banks' holdings of money-market assets. But after the upward turn in the total of bank resources the banks' loans figure had, by the end of October, receded about £50,000,000 from the level reached at the end of June; and the amount of bank lending to the government had sharply increased. The downward turn in loans was in large measure the result of marked improvement in conditions in the London capital market; the expansion in lending to the government was in part the result of seasonal

factors and in part of the inflow of capital from abroad. To the extent that the inflow of capital had the effect of swelling the London reserves of overseas central banks, the authorities supplied the sterling required by selling Treasury bills to the banks concerned, that is, without recourse to the commercial banking system. But where the sterling proceeds of the capital transfer remained on deposit with the commercial banks, the authorities obtained finance to acquire the foreign exchange by borrowing from the commercial banking system.

It was officially decided to continue the process begun in 1949 of enabling the banks to reduce their holdings of the inflexible treasury deposit receipt and so to enlarge their holdings of the flexible treasury bill.

FILMS OF 1950.—*How Banks Serve* (American Bankers Association). (C. H. G. T.)

**Bankruptcy:** see SECURITIES AND EXCHANGE COMMISSION.

**Bao Dai** (1913– ), 13th emperor of former Annam, was born at Hué, Oct. 22. He succeeded to the throne in Jan. 1926 at the age of 13, shortly after the death of his father, Emperor Khai Dinh. Having completed his studies in France, he assumed power in Sept. 1932 under the name of Bao Dai ("he who maintains greatness"). Up to the proclamation of Annamese independence by Japan on March 11, 1945, his position was unaffected by the world situation. On June 30, 1945, he renamed his state Việt-Nam which suggested an idea of reunifying Tonkin and Cochinchina with Annam. Shortly after the Japanese surrender he abdicated under Communist pressure on Aug. 24, becoming citizen N'Guyen Vinh Thuy, "supreme adviser" to Ho Chi Minh, leader of the Việt-Minh (Communist) party and president of a republic of Việt-Nam proclaimed at Hué on Aug. 28. He went to Hong Kong in July 1946 and remained there when, in December, fighting between Việt-Name and the French began. He expressed readiness to negotiate with France "an honourable and lasting peace," and to break with Việt-Minh. Negotiations began in Dec. 1947 and culminated on June 5, 1948, in the protocol of the Bay of Along, by which France recognized the independence of Việt-Nam. On April 28, 1949, Bao Dai returned to Việt-Nam where he was declared an outlaw by Ho Chi Minh. On June 30 he formed a government with himself at the head. In June 1950 Bao left his mountain headquarters at Dalat, 300 mi. N.E. of Saigon, for Cannes, France, in order to be in France while a conference (which opened at Pau on June 29) discussed the setting up in Indochina of a federal administration and the settlement of financial and economic relations between France and Việt-Nam. On Oct. 20 he was back at Dalat.

**Baptist Church.** The major event for world Baptists in 1950 was the eighth congress of the Baptist World alliance at Cleveland, O., during July. The registration of 45,000 from 48 nations was exceeded only by the 57,000 who had attended the sixth congress, Atlanta, Ga., in 1939. Representing 18,000,000 Baptists throughout the world, the congress demanded freedom of peoples everywhere and, under the conviction that all nations are guilty under God for war, called for the practice of religious good will and co-operation as the only assurance of peace. F. Townley Lord, London, Eng., succeeded C. Oscar Johnson, St. Louis, Mo., as president. The ninth congress was planned for London in 1955.

The Australian Baptists faced serious missionary handicaps resulting from the depreciation of the pound. Following Youth month in July, Australian Baptists announced that youth responds to adequate leadership, respects self-evident authority and prefers to choose its own allegiance. Educational films emphasized Christian home life and churches held father-and-son and mother-and-daughter banquets.

The assembly of the Baptist union of South Africa, in September, resolved to establish a Baptist theological college in 1951 at Johannesburg to utilize facilities of the University of the Witwatersrand. The union reported 24,391 members; 700 baptisms in the European churches, 125 in the non-European and 1,168 in the Bantu.

The Baptist Missionary society of London, reporting on the progress of work in Ceylon, announced that the enrolment at Carey Boys college, Colombo, had increased during 1945–50 from 300 to 1,000, and that the girls' schools, as in Colombo, Matale and Ratnapura, had increased similarly in numbers. Protestant bodies discussed closer union in the island. The Baptist Missionary society of London also announced that the officers and staff of Whitewright institute, established in China in 1910, were all Chinese in 1950. During the year 30,500 people heard the gospel at this preaching station. Civil authorities made no effort to close the institute, Christian work was unopposed and it was hoped that Protestant missions' higher education activities could continue.

The Foreign Mission board of the Southern Baptist convention in 1950 opened a theological seminary in Zürich, Switz., with 30 students from 16 nations. All the trustees were European Baptists. The faculty was international—the president Scandinavian, the professors Swiss, British and American. Sixty ministers and students attended the European Baptist Ministers conference at the seminary in June.

The Southern Baptist convention met in Chicago, Ill., with a registration of 8,151 messengers from a membership of 6,761,265.

The Northern Baptist convention meeting at Boston, Mass., changed its name to the American Baptist convention. The registration of 12,182 at the convention broke all records. A membership of 1,561,073 was reported. (See also CHURCH MEMBERSHIP.) (R. E. E. H.)

**Barbados.** Barbados is a British colony consisting of the most easterly of the Caribbean islands. Area: 166 sq. mi. Pop. (1950 est.): 202,669. Capital and chief port: Bridgetown (pop. 1948, 13,345). Governor in 1950: A. W. L. Savage.

**History.**—The most important pieces of legislation passed during 1950 were probably the Adult Suffrage act, giving the franchise to men and women over 21 years of age without any property qualifications, and the Petroleum act, granting a prospecting licence to the Gulf Oil company. The latter act renewed possibilities which had been debated for many years of establishing another major industry in the island besides the cultivation of sugar on which the economy of Barbados had largely depended for three centuries.

Long known as a winter resort, Barbados witnessed during the year a considerable development in the summer tourist trade, the majority of the visitors being Venezuelans. The increased popularity of the colony for tourists at all times of the year was underlined by the beginning of operations by the Trans-Canada Air Lines, which started regular scheduled flights from Montreal, Que. To accommodate these and other long-distance planes a new runway of 6,000 ft. in length was put into use at Seawell airport.

**Finance and Trade.**—Currency: British West Indian dollar set at 4.8 to the pound and valued at 58.33 cents U.S. Budget (1949–50): revenue B.W.I. \$12,150,990; expenditure B.W.I. \$12,095,842. Foreign trade (1949): imports B.W.I. \$33,948,619; exports B.W.I. \$22,341,775. Principal exports: sugar, molasses and rum. (P. H. My.)

**Barkley, Alben William** (1877– ), vice-president of the United States, was born on a farm in Graves county, Ky., on Nov. 24, and attended Marvin college, Clinton, Ky., Emory college, Oxford, Ga., and the University of Virginia law school in Charlottesville, Va. He was elected prosecuting attorney of McCracken county, Ky., in 1905 and was

judge of McCracken county court, 1909-13. He was elected to the U.S. house of representatives in 1913 and after 14 years there was elected to the U.S. senate. He was keynote speaker at the 1936 Democratic national convention, permanent chairman of the 1940 convention, and delivered the speech nominating Franklin D. Roosevelt for a fourth term at the 1944 convention.

Throughout much of World War II he was senate majority leader, and as such shepherded numerous wartime and emergency acts through that body. In 1946 when the Republicans gained control, he became senate minority leader. He was keynote speaker again at the 1948 party convention in Philadelphia, and there was nominated for the vice-presidency, being elected with Pres. Harry S. Truman and taking office in 1949.

As president of the senate Barkley in 1950 twice used his vote to break ties on important issues. On May 3 he voted for a resolution to set up a special committee to investigate crime, rather than leave the investigation to an existing senate judiciary committee. On June 26 he again broke a tie to authorize additional farm price-support funds. Barkley made numerous political appearances in favour of Democratic candidates in connection with the Nov. 1950 elections.

**Barley.** The U.S. barley crop of 1950 was estimated at 301,000,000 bu., 27% larger than the small crop of 1949, but slightly less than the ten-year average production of 310,668,000 bu. California was the leading producer with 57,600,000 bu., North Dakota second (50,688,000 bu. compared with only 25,776,000 bu. in 1949) and Minnesota third with 36,934,000 bu. Colorado, because of winter kill and low yields, produced only 9,555,000 bu., or 41% as much as in 1949. The national average yield was 26.9 bu. per acre, compared with 24.0 bu. in 1949, and 24.2 bu. average for 1939-48.

Barley shared very modestly in the general upward price trend of 1950; the national average price received by farmers late in 1950 was \$1.14 per bushel as compared with \$1.10 in Jan. 1950 and a 1949 average of \$1.04 per bushel. The value of the 1950 crop was preliminarily estimated at \$339,063,000, as compared with \$245,523,000 in 1949. Nonmandatory government price supports were available in the form of loans or purchase agreements at a national average of \$1.10 per bushel, or 75% of the barley parity price as of July 1, 1950.

The world crop of barley was estimated preliminarily at 2,430,000,000 bu., the largest since 1942, compared with 2,260,000,000 bu. in 1949 and an average of 2,357,000,000 bu. for 1935-39. Harvested acreage, estimated at 116,630,000, was 4,000,000 more than in 1949 and slightly more than the prewar average. Yields also were somewhat larger. Canadian production of 171,328,000 bu. was fully 50,000,000 bu. more than in 1949. European production was 690,000,000 bu., approximating the 1949 crop.

The 325,000,000 bu. crop of the U.S.S.R., slightly larger than in 1949, apparently was sufficient to permit exports.

(J. K. R.)

**Baseball.** Connie Mack (Cornelius McGillicuddy), the Philadelphia Athletics' only manager in their 50 years in the American league, retired as pilot of the club on Oct. 18, 1950. He had been associated with the game since joining Meriden of the Connecticut State league in 1884.

In closing out his half-century at the helm of the Athletics, the 87-year-old Mack, who remained as president of the club, named as his successor Jimmie Dykes, third baseman on the team's last pennant-winning clubs in 1929, 1930 and 1931, and manager of the Chicago White Sox, 1934-46.

Dykes had started the season as coach for the club, but on May 26 he was elevated to the job of assistant manager, replac-

ing Earle Mack, Connie's son, who was appointed chief scout. At the same time, Gordon (Mickey) Cochrane, former catcher for the Athletics and later manager of the Detroit Tigers, was promoted from coach to the newly created post of general manager.

Three months later, on Aug. 28, Earle Mack and his brother Roy, club vice-president, gained control of the club stock by purchasing 1,198 shares for \$1,750,000. The remaining 302 shares were held by Connie Mack.

On Sept. 2, Mickey Cochrane resigned as club general manager and Arthur Ehlers, supervisor of the team's farm system, was promoted to the job.

In addition to the transfer of control of the Athletics, important stock change-overs occurred in the Washington Senators, Pittsburgh Pirates and Brooklyn Dodgers.

John J. Jachym, who had acquired 40.4% of the Washington stock a few months earlier, sold his holdings to H. Gabriel Murphy, a Washington insurance broker, on June 22. On July 19 John Galbreath and Tom Johnson, treasurer and secretary, respectively, of the Pirates, purchased the 40% of the Pittsburgh stock which was owned by Frank McKinney, with Galbreath becoming president of the club. On Oct. 26, Walter F. O'Malley and Mrs. John L. Smith, who already owned one-quarter interest apiece, bought another 25% of stock in the Brooklyn Dodgers from Branch Rickey, general manager of the club since Oct. 29, 1942. Rickey later was appointed general manager and executive vice-president of the Pittsburgh Pirates.

The change in the Athletics' field management was one of seven shifts which occurred in the major leagues during the year. On May 26 John (Jack) Onslow was released as pilot of the Chicago White Sox and was replaced by John (Red) Corriden, who had been a coach. Corriden, in turn, was ousted on Oct. 10, giving way to Paul Richards, a former major league catcher who had managed Seattle of the Pacific Coast league in 1950.

Another managerial head to roll was that of Joe McCarthy. On June 23 McCarthy, who had won one flag with the Chicago Cubs (1929) and eight with the New York Yankees (1932, 1936, 1937, 1938, 1939, 1941, 1942, 1943) in a major league piloting career that began in Oct. 1925, stepped down as head man of the Boston Red Sox and was replaced by Steve O'Neill, who started the season as a coach of that club after serving previously as manager at Cleveland and Detroit.

On Oct. 16 Eddie Dyer tendered his resignation as skipper of the St. Louis Cardinals. Dyer had produced one pennant and world championship (1946), three second-place finishes (1947, 1948, 1949) and one fifth-place windup (1950) in five years. Named to succeed him was Marty Marion, veteran Cardinal shortstop.

Lou Boudreau also felt the managerial axe, being ousted as manager of the Cleveland Indians on Nov. 10 after holding the reins for nine years, during which he produced one pennant and world championship (1948). The one-time University of Illinois star, who subsequently signed with the Boston Red Sox as a player, was succeeded by Al Lopez, former major league catcher who guided Indianapolis to one American association pennant and two second-place finishes in three years of managing.

Burt Shotton, who had produced two pennants and one second-place finish in three full seasons as manager, was let out by the Brooklyn Dodgers Nov. 28 and was succeeded by Charles Dressen. The new pilot was a former manager at Cincinnati, coach of the Dodgers and, in 1950, piloted Oakland to the Pacific Coast league championship.

Major league owners, at their meeting in St. Petersburg, Fla., voted Dec. 11 not to renew the contract of Commissioner A. B. Chandler when it would expire on May 1, 1952. The vote was 9 to 7 in favour of a renewal, but a three-fourths' majority, or 12 votes, was necessary.

Also at the annual meeting, the minors and majors repealed the controversial bonus rule. Under the legislation, a free agent who received more than stipulated maximums for signing, ranging from \$6,000 in the majors to \$3,000 in the lower classifications, was ruled a bonus player and could not be optioned without other clubs' first having the opportunity to waive on him.

At the same time, the high school rule, which prohibited a club from contacting a youngster before he or his original high school class had graduated, was wiped off the books. To prevent the wholesale raiding of high school talent, a new rule which would permit contacting a young player while prohibiting the actual signing was scheduled for enactment at an early date.

In the top player deal of the year, the Yankees sent pitchers Duane Pillette and Don Johnson, second baseman George (Snuffy) Stirnweiss, outfielder Jimmy Delsing and \$50,000 to the Browns for pitchers Tom Ferrick and Joe Ostrowski and the assignment of two St. Louis players to New York's farm club at Kansas City, Mo. The Washington Senators and Chicago White Sox figured in a six-player transaction, the Senators sending pitcher Ray Scarborough, first baseman Eddie Robinson and infielder Al Kozar to the Sox for pitcher Bob Kuzava, second baseman Cass Michaels and outfielder John Ostrowski.

Elsewhere the Giants claimed pitcher Jim Hearn from the Cardinals on waivers in midseason and the righthander, who had a 0-1 hill record with the St. Louis club, went on to post an 11-4 mark for the campaign. Late in June the Yankees recalled pitcher Edward (Whitey) Ford from their Kansas City farm and the 21-year-old lefthander hung up nine victories against only one defeat to highlight the Bombers' drive to the American league championship.

In the outstanding transaction of the off season, the Boston Red Sox sent pitchers Joe Dobson and Dick Littlefield and outfielder Al Zarilla to the Chicago White Sox for pitchers Ray Scarborough and Bill Wight. The White Sox also shipped outfielder Myron (Mike) McCormick to Washington for outfielder Ed Stewart. Boston sold catcher George (Birdie) Tebbetts to Cleveland and Pittsburgh signed outfielder Harold (Pete) Reiser, released by Brooklyn.

In postseason polls, Ford was selected "rookie of the year" by the *Sporting News* while the Baseball Writers' Association of America, picking an outstanding first-year player in each league, chose Sam Jethroe, Negro outfielder with the Braves, as the best in the National league, and Walter Dropo, Red Sox first baseman, for the American league honour.

In the balloting for the most valuable players of the major leagues, Phil Rizzuto, New York shortstop, captured the American league honour, and Jim Konstanty, Philadelphia pitcher, triumphed in the National.

**Records.**—Albert (Red) Schoendienst of the St. Louis Cardinals set a major league record for second basemen when he played 57 consecutive games and handled 320 successive chances without an error. Schoendienst's streak surpassed his own record of 44 games and 268 chances set in 1949.

Jim Konstanty of the Phillies broke the major league standard for games appeared in by a pitcher in one season when he took part in 74 contests, all in relief, eclipsing the mark of 65 games established by Ace Adams of the Giants in 1945.

Phil Rizzuto, Yankee shortstop, set two American league records when he played 58 games and handled 288 chances without a bobble, outmoding the marks of 42 games and 226 chances set by Eddie Joost of the Athletics in 1949.

The Boston Red Sox set six major league records in their 29-to-4 victory over St. Louis, June 8. The new marks included most runs in a game by one club, 29; most total bases by one club, game, 60; most extra-base hits, one club, game, 17; most

extra bases on long hits by one club, game, 32; total runs for two games, one club, 49 (following 20-to-4 win the previous day); and most hits, two consecutive games, one club, 51 (23 and 28).

Cleveland broke the major league record for runs scored in the first inning of a game, tallying 14 times in the opening frame of a 21-to-2 conquest of the Athletics, June 18. Brooklyn and Pittsburgh set a major mark, Aug. 23, when they played the longest night game on record, going 17 innings before the Dodgers won, 7 to 5.

Vic Raschi of the Yankees set a major mark on May 3, when he committed four balks in beating Chicago, 4 to 3. On Aug. 31, Gil Hodges, Brooklyn first sacker, belted four homers against the Braves, tying a record set in 1894 by Bobby Lowe of the Braves and equalled by Ed Delahanty of the Phillies (1896), Lou Gehrig of the Yankees (1932), Chuck Klein of the Phillies (1936) and Pat Seerey of the White Sox (1948).

The major leagues' only no-hit game of the season was registered on Aug. 11 by Vern Bickford, Boston Braves' righthander, who set down the Dodgers, 7 to 0.

**Major League Races.**—After a 35-year lapse, the Phillies captured the second National league pennant in their history with a dramatic, last-day victory over the Brooklyn Dodgers.

Paced by their bonus hurlers, righthander Robin Roberts and

YANKEE LEFT FIELDER Gene Woodling regaining third base after Joe DiMaggio had gone out on a short fly ball during the second game of the 1950 world series played at Philadelphia on Oct. 5. The New York Yankees defeated the Philadelphia Phillies 2 to 1 in ten innings

OPENING PITCH by Eddie Lopat of the New York Yankees to leadoff batter Eddie Waitkus in the third game of the 1950 world series played at New York city, Oct. 6. On Oct. 7, the Yankees clinched the championship with their fourth straight victory over the Philadelphia Phillies

lefthander Curt Simmons, and relief specialist Jim Konstanty, the Whiz Kids moved into first place on July 25 and remained there until the finish, despite a near collapse in the waning days of the season.

Entering the final day of the season, the Phils held a one-game margin and were faced with the prospects of a three-game play-off for the title if the Dodgers should win the concluding game, thereby throwing the race into a tie. With Roberts hurling a five-hitter, however, and Dick Sisler providing the pay-off blow with a three-run homer, the Phillies posted a ten-inning, 4-to-1 triumph to annex their first pennant since 1915.

The Yankees nailed down their 17th American league championship on Sept. 29, backing into the title when the runner-up Tigers lost to Cleveland, thereby erasing their last mathematical chance for the flag.

**Individual Performances.**—Billy Goodman, who received his opportunity to play regularly with the Red Sox after Ted Williams suffered an elbow fracture in the All-Star game, ousted George Kell of Detroit as the American league batting champion with an average of .354. Stan Musial of St. Louis captured the National league honours with .346.

Five hurlers reached the 20-win circle. Bob Lemon notched 23 victories for Cleveland, Vic Raschi 21 for the Yankees, Warren Spahn 21 and Johnny Sain 20 for the Braves and Robin Roberts 20 for the Phillies.

Ralph Kiner retained his major league home-run crown, clouting 47 roundtrippers for the Pirates. Al Rosen, rookie Cleveland third baseman, led the American league with 37 homers. Vern Stephens and Walt Dropo of the Red Sox shared the American league runs-batted-in diadem with 144 apiece while Del Ennis of the Phils paced the National league with 125.

**All-Star Game.**—Albert (Red) Schoendienst, St. Louis Cardi-

#### Final Standings

AMERICAN LEAGUE				NATIONAL LEAGUE			
Club	Won	Lost	Pct.	Club	Won	Lost	Pct.
New York . . . . .	98	56	.636	Philadelphia . . . . .	91	63	.591
Detroit . . . . .	95	59	.617	Brooklyn . . . . .	89	65	.578
Boston . . . . .	94	60	.610	New York . . . . .	86	68	.558
Cleveland . . . . .	92	62	.597	Boston . . . . .	83	71	.539
Washington . . . . .	67	87	.435	St. Louis . . . . .	78	75	.510
Chicago . . . . .	60	94	.390	Cincinnati . . . . .	66	87	.431
St. Louis . . . . .	58	96	.377	Chicago . . . . .	64	89	.418
Philadelphia . . . . .	52	102	.338	Pittsburgh . . . . .	57	96	.373

nal second baseman, clouted a home run in the 14th inning to enable the National league stars to defeat the American league representatives, 4 to 3, in the midsummer classic at Comiskey park in Chicago, July 11. The victory was the 5th for the senior circuit in 17 All-Star battles.

Burt Shotton of Brooklyn piloted the winning club while Casey Stengel of New York was at the helm of the losers.

The extravaganza was witnessed by 46,127, who contributed a record \$126,179.51 to the Major League Central fund. It is from this fund that premiums on the players' annuities are paid. Previously the top receipts were \$105,314.91 for the 1947 game at Wrigley field in Chicago.

The game was marred by an injury to Ted Williams, Red Sox slugger, who fractured his left elbow in a collision with the fence in the first inning.

**World Series.**—In the lowest scoring series in history, the Yankees defeated the Phillies in four straight games to register their 13th world championship and mark the sixth time they had accomplished the feat in the minimum number of contests. By totalling only 16 runs, the two clubs lowered the record of 18 tallies set by the Giants and Athletics in 1905.

Vic Raschi held the Whiz Kids to two hits in chalking up the opening game victory. Singles by Willie Jones and Andy Seminick in the fifth inning were the only safeties allowed by the big righthander, although he permitted Eddie Waitkus to get on base on a walk in the sixth inning.

Manager Eddie Sawyer of the Phillies surprised the critics

by starting Jim Konstanty, his relief artist, on the hill, and the bespectacled righthander held the New Yorkers to four hits before bowing out for a pinch hitter in the eighth inning. One of the blows off Konstanty was a fourth-inning double by Bobby Brown, who subsequently scored the game's only run on a pair of outfield flies. The final score was 1 to 0.

Allie Reynolds and Robin Roberts duelled for ten innings in the second tilt before Joe DiMaggio, who had been hitless previously in the series, clouted his seventh homer in classic competition to give the Yankees a 2-to-1 triumph.

The Phillies staged their biggest offensive of the series in the third game, outhitting their rivals, 10 to 7, but they lost 3 to 2. Ken Heintzelman held the Bombers to four hits in seven and two-thirds frames, but he was replaced by Konstanty after issuing three walks in the eighth inning. Shortstop Gran Hamner's error then permitted the Yanks to tie the score and they produced the deciding run in the ninth inning on singles by Gene Woodling, Phil Rizzuto and Gerry Coleman against Russ Meyer.

Edward (Whitey) Ford registered the victory in the deciding game, 5 to 2. Ford held the Phils scoreless until the ninth inning when Woodling's error led to the losers' two runs. With two runners on base, Manager Casey Stengel withdrew Ford in favour of Reynolds, who fanned pinch hitter Stan Lopata for the final out.

The four games attracted 196,009 spectators, with receipts, exclusive of \$175,000 for radio rights and \$800,000 for television privileges, totalling \$953,669.03. The winners' shares amounted to \$5,737.96 apiece while the losers' portions came to \$4,081.34.

**Attendance.**—Although major league turnstile figures showed a 19% decline, slipping from 20,215,365 in 1949 to 17,462,977 in 1950, two clubs, the Philadelphia Phillies and the Detroit Tigers, registered individual club records. The National league champions attracted 1,217,035 spectators to Shibe park while the American league runners-up played to 1,951,474 at Briggs stadium.

The New York Yankees again overshadowed the field at the gate, with a mark of 2,081,380, representing the fifth consecutive season the club topped the 2,000,000 level.

Following are the 1950 attendance figures compared with those of 1949:

AMERICAN LEAGUE			
Club	1950	1949	Change
New York	2,081,380	2,283,676	-202,296
Detroit	1,951,474	1,821,204	+130,270
Cleveland	1,727,464	2,233,771	-506,307
Boston	1,344,080	1,596,650	-252,570
Chicago	781,330	937,151	-155,821
Washington	699,697	770,745	-71,048
Philadelphia	309,805	816,514	-506,709
St. Louis	247,131	270,936	-23,805

NATIONAL LEAGUE			
Club	1950	1949	Change
Philadelphia	1,217,035	819,698	+397,337
Brooklyn	1,185,896	1,633,747	-447,851
Pittsburgh	1,166,267	1,449,435	-283,168
Chicago	1,165,944	1,143,139	+22,805
St. Louis	1,093,411	1,430,676	-337,265
New York	1,008,878	1,218,446	-209,568
Boston	944,391	1,081,795	-137,404
Cincinnati	538,794	707,782	-168,988

**The Minor Leagues.**—A total of 58 minor leagues, one less than the record number in 1949, started the 1950 season, but only 57 finished their schedules as a result of the Class B Colonial circuit's folding up on July 14 because of financial difficulties.

In other changes necessitated by dwindling attendance, Vandergrift (Pa.) dropped out of the Middle Atlantic league; Gadsden, (Ala.) and Anniston (Ala.) from the Southeastern; Bryan and

Paris from the East Texas and Robstown (Tex.) and Donna-Weslaco (Tex.) from the Rio Grande Valley.

Minor league pennant and play-off winners for 1950 follow:

Class	League	Pennant Winner	Play-off Winner
AAA	American association . . . . .	Minneapolis (Minn.)	Columbus (O.)
	International . . . . .	Rochester (N.Y.)	Baltimore (Md.)
	Pacific Coast . . . . .	Oakland (Calif.)	(no play-offs)

\*Play-off winner awarded league championship.

†Bluefield won both halves of split season; Bristol was second in final half and in over-all standing.

The 1950 interleague champions were: junior world series—Columbus (American association) 4, Baltimore (International) 1; Dixie series—San Antonio (Tex.) 4, Nashville (Southern) 3; Gulf Coast-Rio Grande valley—Corpus Christi (Rio Grande valley) 4, Jacksonville (Gulf Coast) 3; Arizona-Texas-Sunset—Juarez (Arizona-Texas) 5, Mexicali (Sunset) 5 (tie scores).

FILMS OF 1950.—*Baseball Fundamentals and Techniques*—N.Y. Giants (Ideal Pictures Corp.); *Baseball Today* (Association Films, Inc.) (L. RE.)

**Basketball.** A sharpshooting band of players representing the City college of New York city proved a real "Cinderella" team of the college court campaign during 1950 by carrying off laurels in the National Invitation tournament and the National Collegiate Athletic association championship to become the first five ever to capture both tourneys in the same year. The Beavers, who were not ranked among the nation's top ten clubs during the regular season, closed out their campaign with a winning streak that completely upset the experts.

Going into the final round of the national invitation test at Madison Square Garden against Bradley university as a three-point underdog, City college staged a second-half drive that subdued the Braves from Peoria, Ill., 69-61, to thrill a gathering of

CITY COLLEGE OF NEW YORK v. BRADLEY during the 1950 National Intercollegiate Invitation tournament in New York city. Bradley was defeated in the final game, making C.C.N.Y.'s the first basketball team to win both this and the National Collegiate Athletic association tourney in the same year

18,000 that saw the Beavers fall behind 30-27 in the opening half. City had earned the right to play in the final by eliminating San Francisco, 65-46; Kentucky, 89-50; and Duquesne, 62-52. After drawing a first-round bye, Bradley halted Syracuse, 78-66, and St. John's of Brooklyn, 83-72.

The same fives survived their regional play-offs to make their way into the final for the N.C.A.A. championship and once again City college checked Bradley, 71-68, after gaining a 39-32 advantage in the initial half. City earned the right to play for the title by conquering Ohio State, the Big Ten king, 56-55, and North Carolina State, 78-73, in the Eastern regional play-offs, while Bradley turned back the University of California at Los Angeles, 73-59, and Baylor, 68-66, in the Western eliminations.

The second annual national Catholic tournament was played at Siena college in Albany, N.Y., and the host five captured the title when it set back St. Francis of Brooklyn, 57-50, in the final contest after overcoming a 32-28 half-time deficit. North Carolina college won honours in the fifth annual tournament of the Negro Intercollegiate association played at Washington, D.C., when it subdued West Virginia State 74-70. The losers had annexed honours in the association's regular campaign.

Ohio State set a blistering pace in the Western conference to gain the Big Ten laurels. The Buckeyes rolled up a total of 787 points in 12 contests to break the conference team scoring record. The former mark of 783 points had been established by Illinois in 1949. Princeton, after losing its opening league contest, swept through ten straight games to win the Eastern Intercollegiate (Ivy) league championship for the first time since 1932. Kentucky rolled to its seventh straight Southeastern conference title and Adolph Rupp, veteran mentor of the high-scoring Wildcats, won general acclaim as the "coach of the year."

Among other college champions during the campaign were: U.C.L.A., Pacific Coast conference; North Carolina State, Southern conference; Bradley, Missouri Valley conference; Arkansas and Baylor (tied), Southwest conference; Kansas, Kansas State and Nebraska (tied), Big Seven conference; Brigham Young, Skyline Six conference; and Indiana State, National Association

of Intercollegiate Basketball.

The Phillips "66" Oilers of Bartlesville, Okla., regained the men's national Amateur Athletic union championship and the Nashville Business college of Tennessee came through to victory in the women's tournament.

The long professional campaign featured high-scoring games, the deciding contest of the final play-offs for the National Basketball association crown being no exception as the Minneapolis Lakers conquered Syracuse 110-95 on the victors' court. George Mikan accounted for 40 markers as the Lakers retained their title by a margin of 4 games to 2.

Scranton, Pa., came through to the top in the American league race, turning back Bridgeport, Conn., 3-2 in the best-of-five series for the championship of that organization. (T. V. H.)

**Basutoland:** see BRITISH SOUTH AFRICAN PROTECTORATES.

**Baudouin** (BAUDOUIN ALBERT CHARLES LEOPOLD AXEL MARIE GUSTAVE, DUKE OF BRABANT) (1930- ), prince royal of Belgium, was born at Stuyvenberg castle, near Brussels, on Sept. 7, elder son of King Leopold III (*q.v.*) and Queen Astrid. Just before he was five he lost his mother in a motor accident and was almost ten when Belgium was invaded by the Germans. He accompanied his father during his internment in Germany (June 1944-May 1945) and his subsequent voluntary exile in Switzerland. He was for the most part privately educated but during his father's stay at Pregny, near Geneva (1945-50), he attended a state college at Geneva. On Aug. 11, 1950, before a joint session of the senate and the chamber of representatives, he was informed that parliament had granted him power to exercise the royal prerogatives, to which he answered in French and Flemish, "I accede to the wish of parliament." He took the oath to observe the constitution and the law.

By the terms of his father's abdication he was to ascend the throne on Sept. 7, 1951.

**Bauxite:** see MINERAL AND METAL PRODUCTION AND PRICES.

**Bayar, Celâl** (1884- ), president of Turkey, was born May 15 at Umurbey, near Bursa, the son of a Turkish immigrant from Bulgaria. He was educated at a French school at Bursa. Later, imbued with the western outlook, he entered the *Deutsche Orient Bank*. After the Young Turk revolution in 1908 he became secretary of the Committee of Union and Progress in Izmir, in which capacity he worked for Turkish nationalism. In the revolution of Kemâl Atatürk and the war against the Greek invasion he took an active part, placing himself at the head of the resistance movement. From Feb. 27, 1921, to Jan. 15, 1922, he was minister of national economy. On March 6, 1924, he was appointed minister for exchange and rehabilitation of refugees. He resigned on July 7, 1924, to become head of the newly founded İş (Business) bank. In 1932 he returned to the government as minister of national economy; he became acting prime minister on Sept. 20, 1937, and succeeded İsmet İnönü as prime minister on Oct. 25, 1937. Following the death of Atatürk (Nov. 1938) and the election of İnönü as second president of the republic. Bayar resigned on Jan. 25, 1939. Re-elected deputy, he became the leader of a minority within the Republican People's party who warned their colleagues against the dangers of a one-party system. In June 1945 he resigned from the R.P.P. and on Jan. 7, 1946, formed the Democratic party, which won 62 seats in the elections on July 21, 1946, and which under his leadership secured an overwhelming victory in the elections of May 14, 1950. He was elected third president of the Turkish republic by the new parliament by 387 votes against 64 for İnönü. (MA. B.)

**Belgian Colonial Empire.** The Belgian colonial empire consists of the colony of the Congo in central Africa and the adjacent trust territory of Ruanda-Urundi. The accompanying table gives material relative to all territories administered by Belgium. Total area: about 925,094 sq.mi. Total pop. (1949 est.): about 14,810,500. Chief towns (white pop. only, Dec. 1948 est.): Léopoldville (cap., 7,244); Elisabethville (6,240); Stanleyville (1,517); Costermansville (1,511). Governor general: Eugène Jungers.

**Belgian Congo.**—The ten-year plan for the Congo's economic and social development, published in 1949, formed the starting point for 1950. Pierre Wigny, minister for the colonies, obtained approval for his schemes from the Belgian cabinet in February and visited London and Paris to obtain informal co-ordination from two governments with neighbouring colonial interests. Eugène Jungers, governor general of the Congo, expounded aspects of the program to the annual meeting of the Congo government council at Léopoldville (July 17-22).

Two important steps to raise native standards were the opening of the first all-native co-operatives of many types (planters, fishermen, artisans, etc.) under government supervision and the creation of a savings bank in which natives were for the first time allowed to deposit both personal and corporate funds. A decree was passed prohibiting polygamy after the end of 1950.

Representations by the principal organization of white settlers (U.C.O.L.), asking for the exclusion of natives from the nominated and consultative government council were rebuffed by Jungers. Proposals to create a Congo legislative council, with powers comparable to those of the Belgian parliament, he referred to the government council, which rejected them. The government council, however, asked that it should be compulsory for the government to submit proposed decrees of importance to the council or its standing committee and to justify before its members any failure to introduce such legislation as the council might twice request. At the same time the council reaffirmed the governor general's duty to issue urgent decrees on his own responsibility.

Under the ten-year plan the colony's 44,000 European population was to be doubled. A propaganda campaign was opened in Belgium to attract professional skill to the Congo, especially engineers, agricultural technicians and doctors. Plans were approved

for a new airport 20 km. east of Léopoldville, and arrangements made for the Belgian air force to do much of its training in the Congo. Additional hydroelectric plants were erected, chiefly in the Katanga province and the neighbourhood of Stanleyville. In both these areas there was an extension of private building.

In October a 4% Congo loan of 60,000,000 Swiss francs, to be repaid in ten annual instalments from the end of 1959, was floated. Other financial developments included the raising of the official rate for "free" gold sales from the Congo from 64,000 to 66,000 Belgian francs a kilogram. A number of natives in the Kivu province and Ruanda-Urundi were arrested on a charge of illicitly extracting and exporting alluvial gold.

**Ruanda-Urundi.**—In February the U.N. Trusteeship council approved the administration of this territory, but recommended steps to abolish flogging. They rejected the claim of Mwambutsa, *mwami* (king) of Urundi, to the legal sovereignty of 60,000 inhabitants of the Bugufi district of Tanganyika. Accompanied by his brother and three other chiefs, Mwambutsa visited Belgium in July (as the *mwami* of Ruanda had done the year before). He was received by the regent and subsequently by King Leopold III and Queen Elisabeth.

**Education.**—Belgian Congo (Jan. 1949): European schools 44, pupils 6,470; native schools 26,293, pupils 878,972. Ruanda-Urundi (Jan. 1949): state schools 2, pupils 1,240, native teachers 21. Roman Catholic schools 3,549, pupils 289,835, native teachers 4,749; Protestant schools 437, pupils 34,322, native teachers 638. (H. D. Z.)

**Belgian Congo:** *see* BELGIAN COLONIAL EMPIRE.

**Belgium.** A kingdom in western Europe, Belgium is bounded S.W. by France, N. by the Netherlands and E. by Germany and Luxembourg. Area: (incl. some German frontier localities annexed on April 15, 1949) 11,783 sq.mi. Pop.: (1947 census) 8,512,195; (1949 est.) 8,614,000. Languages (1930): Flemish (Dutch) 42.92%, French 37.56%, German 0.85%, Dutch and French 12.92%, German and French 0.83%. Religion: mainly Roman Catholic. Chief towns (pop., 1948 est.; first figure including suburbs, second figure commune only): Brussels (cap., 1,296,687; 185,112); Antwerp (chief port, 794,280; 266,636); Liège (573,176; 156,664); Charleroi (445,229; 26,262); Ghent (442,792; 166,797); Namur (215,069; 31,637); Bruges (200,850; 52,984). Ruler: King Leopold III (*q.v.*); regents in 1950: Prince Charles and (from Aug. 11) Prince Baudouin (*q.v.*); prime ministers in 1950: Gaston Eyskens, Jean Duvieusart (from June 8) and Joseph Pholien (*q.v.*, from Aug. 15).

the royal question. The bill, already passed by the senate, to authorize a referendum on the desirability of King Leopold's resuming his prerogatives was debated in the chamber of representatives throughout January and finally passed (117 votes to 92) on Feb. 8. The referendum, at which voting was compulsory, was to be purely advisory. The king had indicated beforehand that if he received less than 55% of the votes cast he would withdraw in Prince Baudouin's favour. The Socialists, with some Liberal support, maintained that only a Leopoldist vote of 66% or 70% in the country as a whole, with at least a bare majority in each of the three regions—Flanders, French-speaking Wallonia and Brussels—would justify his return.

The referendum passed off quietly on March 12. It showed a 57.68% majority for the king (2,933,745 against 2,151,099). But whereas Flanders produced a 72% Leopoldist result, the Walloon vote was 57.8% hostile and Brussels polled 51.8% against the king. Summoning the Social Christian (Catholic) premier, Gaston Eyskens, and the presidents of the two houses of parliament to his home at Pregny, near Geneva, Switz., King Leopold issued a statement showing that while he would not take action in advance of parliament's verdict, he himself interpreted the results as a signal for his recall.

The Social Christian majority of the government was now anxious to summon a joint session of the two houses to end the regency. The Liberals, however, withdrew their eight representatives from the two-party cabinet, which resigned on March 18. The Socialists gave notice that they would oppose the king's return by every means, including a general strike.

After the 81-year-old Count Henri Carton de Wiart, a former Catholic premier, had failed to form a government on March 24, and after successive failures by Albert Deveze, the outgoing Liberal vice-premier and minister of defense, and Paul van Zeeland, the outgoing Social Christian foreign minister and former premier, Zeeland and the king's secretary, Jacques Pirenne, went to Geneva to see King Leopold, who (by a recording made in Switzerland) broadcast to his people on April 15 for the first time since 1940. His message contained a suggestion, previously mooted both by Liberals and by Socialists, that he might return to the throne but "delegate the exercise of his powers temporarily" to his 19-year-old heir.

At the suggestion of Paul-Henri Spaak, the former Socialist premier, three-party talks were held to discuss how this offer, criticized by the more extreme Leopoldists, might be implemented. The opposition's misgivings lest the king should ultimately resume his original powers from Prince Baudouin were increased when a further visit of Zeeland to Geneva produced a refusal from the king to leave Belgium after transferring his prerogatives. The Socialists withdrew from the negotiations, and after fresh friction with the Liberals, Eyskens and Zeeland jointly persuaded the regent to grant a dissolution.

Elections were held on June 4. The Social Christians, gaining 47.68% of the votes (just 10% below the Leopoldists' results in the referendum), returned with 108 out of 212 seats in the chamber—the first clear parliamentary majority since 1914. The Socialists had 77 seats, Liberals 20, Communists 7. Jean Duvieusart, 50-year-old minister for economic affairs in the Eyskens government, formed a new all-Catholic cabinet of eight Flemings and seven Walloons. Duvieusart visited King Leopold and, having announced his intention of calling a joint session of the two houses to repeal the Regency law, obtained a vote of confidence from each house separately.

On July 20, the bill ending the regency passed by 198 votes to none, the Socialists, Communists and almost all the Liberals having walked out. In the early morning two days later—time and place being kept secret—King Leopold, Prince Baudouin and Prince Albert landed at Evere military airport and drove straight

"CAREFUL, YOUR MAJESTY!" Swedish cartoon by Malachowski which appeared in the *Stockholms-Tidningen* in 1950

out to Laeken palace.

A few hours later King Leopold broadcast to the nation, sent messages to parliament, confirmed the Duvieusart cabinet in office and summoned to a crown council the ministers of state. Count Hubert Pierlot, the wartime Catholic premier, declined to attend. The Socialists had already resigned their honours. The Liberals left without meeting the king, and their executive issued a statement refusing political co-operation with him and urging his "voluntary and honourable abdication." On the other hand, an immense quantity of flowers, chiefly from Flemish supporters of the king, began to arrive at the palace.

A campaign of sabotage by explosives, chiefly directed against railway and telephone lines, and widespread strikes in Wallonia, were described by Spaak in the chamber as "having the character of an insurrection, though they might be the beginning of a revolution." The flag of Walloon separatism was raised in Liège, Charleroi and elsewhere, and within a week 500,000 men were on strike. Sabotage blocked most railway lines and some main roads. On July 30 Max Buset, the Socialist party chairman, declared that unless decisive steps were taken, there might be civil war the following day. In defiance of the government preparations had already been made for a "march on Brussels" on Aug. 1 by 100,000 persons from Walloon mines and factories.

The cabinet sat almost continuously through the night of July 30–31. By 8 P.M. on July 31 an agreement in principle was reached between the party leaders, the government and the king's representative. The prime minister was to broadcast the actual text two hours later. Its basis was that the king should hand over his powers to Prince Baudouin at once and abdicate on the prince's 21st birthday, Sept. 7, 1951. He was not, however, obliged to return into exile. King Leopold now revived an already rejected condition that he might at his own discretion resume full powers from Prince Baudouin. The broadcast was cancelled, and it was not until 6:30 A.M. on Aug. 1 that the king was persuaded to accept the solution agreed to on the previous day. In a subsequent open letter to the prime minister he made it clear that he yielded only to the threat of being left without a government at all.

The bill transferring powers to Prince Baudouin provoked some fresh parliamentary scenes, but passed both houses in turn (160 votes to 127 and 121 to 22). On Aug. 11 a joint morning session of the two houses resolved that the royal prerogative should henceforth be exercised by the prince royal, Baudouin. The same afternoon he took the oath before the two houses and the principal notables of the realm.

Prince Baudouin's first political act was to ask Zeeland, the strongest Leopoldist in the previous cabinet, to form a new gov-

ernment. This he did on Aug. 15, but opposition of the moderates forced Zeeland, while remaining foreign minister, to yield the premiership to Joseph Pholien, a 66-year-old Catholic senator. Except for a new nonpolitical minister of defense, Col. Edouard De Greef, the government was composed, like its predecessor, entirely of members of the Social Christian party but all the senior ministers of the former cabinet, apart from Zeeland, were eliminated. The chamber and senate passed a vote of confidence in the new government (107 to 78 and 82 to 61) before going into recess.

**Benton, William** (1900— ), U.S. senator and publisher, was born on April 1 in Minneapolis, Minn. He was graduated from Yale university in 1921. In 1929, in partnership with Chester Bowles, he founded the advertising agency of Benton and Bowles.

Benton retired from the agency in 1936, and in 1937 became vice-president of The University of Chicago, on a part-time basis. At his instance the university acquired Encyclopædia Britannica, Inc., in 1943. He financed the company, became chairman of its board and shared its ownership with the university. He launched Britannica into the classroom motion-picture field and served as chairman of Encyclopædia Britannica Films Inc.

During this period, in collaboration with Paul Hoffman, he helped to found the Committee for Economic Development, and he was active in inter-American affairs.

Benton was appointed U.S. assistant secretary of state by Pres. Harry S. Truman on Aug. 31, 1945, and served until Sept. 30, 1947. He developed the country's first peacetime program of international information and educational exchange and took responsibility for U.S. participation in the United Nations Educational, Scientific and Cultural organization.

In Dec. 1949 Benton was appointed U.S. senator from Connecticut, where he had lived for 17 years, by Governor Bowles, to succeed Raymond E. Baldwin, who resigned from the senate effective Dec. 17, 1949. His first year in the senate was marked by his proposal of a "Marshall Plan of Ideas"; by his vigorous espousal of the Hoover commission recommendations on government reorganization; and by his activities in behalf of small business. In the election of Nov. 7, 1950, he was returned to the senate for two more years.

**Bequests, Philanthropic:** see DONATIONS AND BEQUESTS.

**Berlin.** Capital of the German reich from 1871 to 1945, Berlin was still by 1950 the largest city of Germany. Area: 343.6 sq.mi. Pop.: (1939 census) 4,321,500; (1946 census) 3,180,300 or 26.4% less. From June 6, 1945, to June 24, 1948, Berlin was administered by an inter-Allied government authority (in Russian, *Kommandatura*) consisting of the commandants of the four sectors of Berlin. After June 24, 1948, when the soviet commandant proclaimed the dissolution of the *Kommandatura*, Berlin was in fact divided into two opposing administrations. The three western sectors (pop., mid-1950 est., c. 2,500,000) in 1950 were under the authority of the three following Allied commandants: Great Britain, Maj. Gen. G. K. Bourne; United States, Maj. Gen. Maxwell D. Taylor; France, Gen. Pierre Carolet. In the soviet sector (pop., mid-1950 est., 900,000) the civil administrator was Serghy A. Dienghin (who on June 7 succeeded the

BELGIAN RIOT SQUADS battling demonstrators in Brussels on July 28, 1950, following the return of King Leopold after six years of exile. Tension subsided on Aug. 1, when the king agreed to relinquish his sovereignty to Prince Baudouin until the youth's 21st birthday in 1951, when Leopold would abdicate finally in favour of his son

military commandant, Maj. Gen. Alexander G. Kotikov). There were also two rival German city governments and two lord mayors: Ernst Reuter, appointed *Oberbürgermeister* on Dec. 7, 1948 by a city assembly elected by the population of the three western sectors; Friedrich Ebert, appointed provisional *Oberbürgermeister* of the soviet sector on Nov. 30, 1948 by a meeting summoned by the Communist S.E.D. (*Sozialistische Einheitspartei Deutschlands*).

**History.**—During 1950, two city councils and two lord mayors still functioned. The fiction of unity was, however, maintained by all four occupying powers. Western Berlin remained outside the western German Federal Republic and elections in the eastern German Democratic Republic did not include eastern Berlin.

Communist attempts to interfere with the Dec. 3 election in western sectors were unsuccessful. Their proposals for postponement until "free democratic elections" could be held throughout the whole city, in March 1951, were rejected by both the western Berlin government and the three western Allied commandants. These proposals, similar to those unsuccessfully put forward in May, were made on Nov. 26, in a letter to the four commandants and the German administrations in western and eastern Berlin. They would have opened the way to Communist control since they demanded withdrawal of all occupation forces. Soviet troops and German *Volkspolizei* would still be on the outskirts of the city but the nearest Allied troops would be 100 mi. away.

**Western Sectors.**—More than 90% of the 1,664,091 electors in western Berlin refused on Dec. 3 to obey the eastern German government's instructions to boycott the municipal elections. Having received 653,974 votes or 44.7% (compared with 858,100 or 64.5% on Dec. 5, 1948), the Social Democrats remained the largest party. The Christian Democrats increased their vote from 253,496 (19.4%) to 360,829 (24.6%) and the Liberals or Free Democrats from 214,224 (16.1%) to 337,477 (23.0%).

Grave economic problems continued to worry the city authorities and the western Allies. Basically they were political, since this former capital could flourish only in a united Germany. Any measures taken meanwhile could be only palliatives. What was needed was a substitute for markets denied to western Berlin in the east. Foreign and western German orders had in the meantime helped to restore normal economic and political conditions. The labour force in the three western sectors amounted to 1,168,000 men and women, with about 30% either unemployed or in makeshift jobs. The city budget was 1,500,000,000 deutschemark with a deficit of 655,000,000 DM. Excluding charges resulting from World War II, this was about the same as the normal budget before 1933 but without the former sources of wealth. Federal republic aid amounted to 540,000,000 DM. annually. Investment needs in 1950-51, according to city authorities, totalled 1,134,000,000 DM. Of this it was estimated that 160,000,000 DM. could be met from public and 319,000,000 DM. from private sources. This left 650,000,000 DM. to be supplied from ERP (European Recovery program) and G.A.R.I.O.A. (Government Appropriation and Releases in Aid of Occupied Areas) funds.

Great strides in industrial production, however, were made during the year. In January this was valued at 95,000,000 DM. and in September at 175,000,000 DM. (42.7% of 1936). One important achievement was the completion of the electric power station which made the western sectors independent of eastern German supplies. Exchange rates of western and eastern marks varied between 1:8 and 1:4.5. Resulting price differences created serious problems in the western sectors.

Western Berlin's position as an outpost of democracy behind the "iron curtain" received greater consideration from the Federal republic during 1950. On Feb. 3 Heinrich Vockel took up residence as official representative in Berlin of the Bonn government. On March 24 the federal parliament decided that the

SOVIET INSPECTION OF PAPERS of four persons holding legal permission to leave the eastern zone of Berlin in 1950. Others left the zone illegally during the year, in a steady flow westward

federal administrative court and certain other federal organs should be transferred to western Berlin and on April 17, a *Bundeshaus* was opened by Chancellor Konrad Adenauer.

The new western Berlin constitution was promulgated on Oct. 1, in the presence of Pres. Theodor Heuss, members of the federal government and parliament and the three western commandants. When, on Aug. 29, the constitution was approved by the three western commandants it was stated that western Berlin would have the status of a *Land* and a city, but would not be legally recognized as the 12th *Land* of the federal republic.

A number of exhibitions and congresses held in western Berlin during 1950 attracted world attention. Among them were a motor car show (June 4) and an international exhibition of industry (Oct. 1-14). The International Congress for Cultural Freedom (June 26) brought to Berlin world-prominent anti-Communist spokesmen, and on Oct. 24 a Freedom Bell was unveiled in the tower of the *Schöneberg Rathaus* (headquarters of the western Berlin city council). The ceremony was performed by Gen. Lucius D. Clay, former U.S. military governor in Germany and president of the organization Crusade for Freedom which presented the bell.

**Soviet Sector.**—Indications of food and other shortages were shown by the manner in which eastern Berliners took every opportunity to cross over into western sectors to buy food, though prices there were much higher because of the low rate of the eastern mark. Indicative of the political feelings of eastern Berliners was their response to the invitation from western Berlin authorities to show whether they favoured a united Berlin on the basis of free and secret elections by sending in their used ration cards for September to the *Schöneberg Rathaus*. From an electorate of 850,000, as many as 375,712 responded (Oct. 3-10).

About 60,000 western Berliners still worked in the eastern sector and were paid in eastern marks, but had to pay most of their bills in western marks. This was a great hardship since the western sector authorities could compensate only in part for the loss. Communists attempted by all kinds of pressure to get these people to transfer their homes to the soviet sector.

Greatest activity during the year was in clearing away rubble and in building—not so much private dwellings as enormous public structures. Many historical monuments were destroyed or removed elsewhere. Berlin *Schloss* was taken down to make place for huge tribunes where hundreds of thousands of spectators could watch demonstrations on the great parade ground of the *Lustgarten*. The monument of Frederick the Great, formerly on Unter den Linden, was removed to Potsdam, and a new soviet embassy replaced on Unter den Linden the former one destroyed during World War II.

(J. E. WI.)

**Bermuda.** Bermuda is a British colony of about 300 small islands in the western Atlantic about 580 mi. east of Cape Hatteras in North Carolina. Area: 21 sq.mi. Pop. (1948 est.): 36,169 including 13,173 white. Chief towns: Hamilton (cap., c. 3,500); St. George (c. 1,300). Governor (1950): Lieut. Gen. Sir Alexander Hood.

**History.**—The admiralty announced in 1950 that for reasons of economy it had decided to close the dockyard by the end of March 1951. The colonial legislature set up a permanent joint committee to handle problems arising out of the dockyard's closure. Another problem that faced the colony was the replacement of its cedar trees largely destroyed by disease; the director of agriculture stated that it would be necessary to spend more than £1,000,000 on reforestation.

There was a record tourist season, and work began on a new civilian airport at Kindley field.

**Finance and Trade.**—Currency: Bermuda pound (at par with sterling). Budget (1949): revenue £1,885,548; expenditure £1,706,587. Foreign trade (1949): imports £7,182,178; domestic exports £40,451; re-exports £902,670. Lilies and lily bulbs were the only important domestic exports, and the economy of the colony was primarily dependent on the tourist industry.

**Betting and Gambling.** Gambling, both in terms of money and in incidence, was much reduced during 1950. This was chiefly because of political pressure and investigations that sent many professional gamblers into hiding or caused them to reduce their operations.

Early in the year the Brooklyn district attorney, Miles McDonald, began an investigation of alleged "protection pay-offs" by gamblers to New York city police. Continued investigation and prosecutions in New York led to the sentencing of Frank Erickson, popularly considered one of the biggest U.S. bookmakers, to a two-year prison term. Erickson pleaded guilty to conspiracy and bookmaking.

The murder in April of Charles Binaggio, Kansas City, Mo., politician, and his assistant, Charles Gargotta, was generally reported to be attributable to warfare within a gambling syndicate nation-wide in scope. Largely as a result of this, the U.S. senate in May appointed a committee to investigate nation-wide crime, with Sen. Estes Kefauver, Tennessee Democrat, as chairman. This committee's early findings linked gambling more than any other form of crime to political corruption. The committee travelled to Miami, Fla., to Los Angeles, Calif., to New York, N.Y., and twice to Chicago, Ill. At the year's end it was in Tampa, Fla., with New Orleans, La., next on the list.

Much violence and corruption was attributed to the investigation.

The revelations of this committee were thought to have had some influence on the November elections, contributing to the defeat of some Democratic candidates in Chicago and New York.

Few corrective laws were passed, though in December Pres. Harry S. Truman signed a bill prohibiting the interstate shipment of gambling slot machines. However, efforts to legalize gambling were generally unsuccessful. California and Arizona voters, in the November elections, refused amendments that would have made gambling in various forms legal. Massachusetts voters turned down a proposed state lottery. The proposal that bookmakers be licensed, made early in the year by Mayor William O'Dwyer of New York, was opposed by Gov. Thomas E. Dewey, and no further action was taken on it.

Many gambling houses closed, and many more reduced their staffs because of diminished play. It was a moot point, however, whether this entrenchment was caused more by fear of arrest or by increased costs of necessities of living.

The betting totals at the nation's race tracks, where betting is legal, were reduced an estimated 10%; betting away from the track may have been reduced as much as 50% from 1949 totals. There was less betting on sports events.

Forms of gambling remained the same, with almost the only development a revival of interest in keno in the south and south-

STATE POLICE RAIDING a gambling establishment in southern Illinois during a state-wide cleanup campaign launched in 1950. Racing papers are shown littering the floor where they were dropped by patrons during the surprise raid

west. This represented little more than a substitution of keno for bingo games, however, and the two games are very similar, both being forms of lotto. (A. H. MD.; M. ML.)

**Great Britain.**—In 1950 the Royal Commission on Betting, Lotteries and Gaming, which was appointed in 1949, completed the hearing of evidence. Its report was expected in 1951.

The only official statistics for betting in Great Britain were as follows:

	1950	1949 (£million)	1948
Totalizator at race tracks . . . . .	25.5*	25.8*	26.3*
Totalizator at dog tracks . . . . .	70.5†	85.6‡	99.5‡
Pools (all forms) . . . . .	52.3†	64 †	61 †

Sources: \*Race Course Betting Control Board.  
†Customs and Excise Return. ‡Home Office.

These statistics show the continued decline in betting that was apparent in 1949. The changing economic situation may have contributed to this, for the excess money of the years immediately after World War II was absorbed in the higher cost of living and the more plentiful supply of consumer goods. The taxation imposed on the totalizator at dog racing tracks may also have diverted money to bookmakers operating off the course. There were no statistics for the business carried on by bookmakers; they were not obliged to publish accounts.

Despite the slight decline in turnover on pools, 1950 would be remembered for its record-breaking pool prizes. In a period of less than two months, from Sept. to Nov. 1950, a series of winners drew sums ranging from £68,420 to £104,417. Three of the wins were of more than £100,000, and there were three of more than £90,000. At the peak win it was decided to limit future prizes to a maximum of £75,000. By the end of the year this new maximum had not been won.

The fact remains that during 1950 there was slightly less active interest in betting, and that those participating were spending less than in previous years. With more than 70% of the adult population indulging in a regular gamble it was not possible to assess whether this decline was of a temporary or permanent nature.

**Commonwealth.**—In Australia there was no sign of a decline in betting, which was carried on by more than 80% of the population. In three of the six states there was a government lottery every month (every week in Western Australia), where the prizes ran as high as £15,000 tax free. Only in Victoria and South Australia were lotteries forbidden. The betting turnover for the whole country was more than £250,000,000 a year. In New Zealand the interest in betting was as great as in Australia. The government ran ten lotteries each year and also took a large percentage from the totalizator at race tracks. In India and Pakistan there were no lotteries but football pools, based on the British games, had been started. South Africa, in contrast, had declared all dog racing and football pools to be illegal.

**Europe.**—The Netherlands had joined Norway and Sweden in sponsoring state-owned football pools based on the results of British games. There was little interest in betting as a commercial organization in any of these three countries. (H. C. LA.)

**Bevin, Ernest** (1881— ), British foreign secretary, was born at Winsford, Somerset, Eng., March 9. He became national organizer of the Dockers' union in 1910, and in 1921 secretary of the newly formed Transport and General Workers' union. From 1925 to 1940 he was a member of the general council of the Trades Union congress and in 1937 was chairman. In May 1940 he became minister of labour in Winston Churchill's coalition government and entered the house of commons for central Wandsworth. He became secretary of state for foreign affairs in the Labour government in July 1945. In 1949 he

signed the North Atlantic treaty and the statute of the Council of Europe on behalf of the United Kingdom. In Jan. 1950, he attended the first Commonwealth Foreign Ministers' conference at Colombo, Cey. On Feb. 23, he was elected M.P. for East Woolwich, and on Feb. 28 was reappointed foreign secretary. In March he had discussions with the French foreign minister, Robert Schuman, and in April he went to Strasbourg, Fr., to attend a meeting of the Committee of Ministers of the Council of Europe and to Paris to attend a council meeting of the Organization for European Economic Cooperation. During May he had several discussions with the U.S. secretary of state, Dean Acheson, including one on the question of an Austrian peace treaty at which Robert Schuman was also present. On three occasions during the year, in March, April and June, he underwent surgical treatment. He attended the Consultative assembly of the Brussels treaty powers at The Hague on Aug. 1 and took part in the meeting of the Committee of Ministers at Strasbourg which began on Aug. 3. On Sept. 7 he sailed for New York where he conferred with Dean Acheson and Robert Schuman on Sept. 12 and attended a meeting of the North Atlantic council before the opening of the U.N. general assembly on Sept. 19. In early December he had discussions with the Egyptian foreign minister on Anglo-Egyptian political differences.

**Bhutan.** A semi-independent state in the eastern Himalayas, Bhutan lies between Tibet and India. Area: c. 18,000 sq.mi. Pop. (no census ever taken, 1949 unofficial est.): 300,000. Language: a dialect of Tibetan. Religion: mainly Buddhist. Capital, Punakha. Ruler, Maharaja Jigme Wangchuk.

**History.**—By virtue of the treaty of friendship between India and Bhutan, the text of which was presented to the Indian constituent assembly on Dec. 14, 1949, India in 1950 became responsible for the external relations of Bhutan but undertook to exercise no interference in the internal administration of the state, which in effect acceded to India. The new arrangement with India represented a continuance of the relations which existed between Bhutan and the former British government of India.

A mountainous state with a population mainly of Tibetan origin, Bhutan was disturbed by events in Tibet in the latter part of the year; but, although there was the bugbear of imperfectly defined boundaries, the position of this by no means easily accessible country under the Indian umbrella did not cause its people great anxiety. The system of government continued to be that of a secular autocracy, the ruler's possession of absolute authority being tempered by the considerable powers retained by the leading chiefs. (E. HD.)

**Bicycling:** see CYCLING.

**Billiards.** Willie Hoppe, a world billiards champion as far back as 1906, continued to dominate the three-cushion field in 1950. He successfully defended his laurels twice, both times mastering his most persistent challenger, Joe Chamaco of Mexico City. In February, at Chicago, Hoppe retained his crown in the annual universal title tournament against the top survivors in the national championship competition, which was won by Chamaco. At the end of the regular world tourney, Hoppe and Chamaco were deadlocked for first place, each with a record of five victories and one defeat.

Hoppe, who had beaten the Mexican, 50-33, in 48 innings, to force a play-off, turned back Chamaco, 50-28, in 58 innings, to clinch the championship. Before the year ended the pair again met, this time in a 20-block challenge match. Hoppe again proved his mastery over Chamaco by taking the two-week contest, 1,000 points to 873. In the 17th block, which Hoppe won, 50-28, sport's longest reigning champion had a high run of 15, his best competi-

tive performance since he made the same number of points against Welker Cochran in 1937.

Willie Mosconi regained the world pocket-billiard crown and set a world tournament record for a  $4\frac{1}{2} \times 9'$  table with a grand average of 18.34. Mosconi and Irving Crane, who took the national title on total points with Mosconi the runner-up, were tied for world honours in regulation play, each with a 4-2 record. The play-off found Mosconi in front, 150-112, in 18 innings, as he notched his fifth world crown.

Walter Johnson of Ohio State university, Columbus, captured the intercollegiate three-cushion championship and Leroy Kinman of Eastern Kentucky State college, Richmond, retained the pocket crown.

(P. Br.)

**Biochemistry.** **Intracellular Distribution of Enzymes.**—Progress was made during 1950 in studying the relationship between cell structure and cell chemistry. Investigators working on the intracellular distribution of enzymes developed centrifugation procedures which permitted the separation of four cell fractions from tissue homogenates. The four fractions were: (1) cell nuclei; (2) microscopically visible subcellular bodies—mitochondria; (3) submicroscopic particles—microsomes; and (4) a soluble protein fraction. An important feature of the fractionation technique was the use of hypertonic or isotonic sucrose solutions as the suspending medium instead of solutions of electrolytes.

Using mainly mice and rat liver and kidney it was shown that the enzymes which convert glucose to lactic acid are in the soluble fraction of the cytoplasm. The oxidation of pyruvic acid and of fatty acids is carried out by enzymes which are components of the large subcellular particles—the mitochondria. The mitochondria also contain enzymes which can transfer the energy released during the oxidation of pyruvic acid and fatty acids into high-energy phosphate ester bonds. The energy stored in these phosphate ester bonds can later be used to synthesize compounds needed by the cell. Assays of these cell fractions showed that such enzymes as succinoxidase, oxaloacetic oxidase and isocitric dehydrogenase which catalyze the aerobic oxidation of glucose are in mitochondria. However, large amounts of isocitric dehydrogenase also occur in the soluble protein fraction. Cytochrome *c*, a soluble conjugated protein, also occurs in the mitochondria and represented the first example of a protein which had been extracted in a soluble form from what was considered the insoluble portion of the cell. These results emphasized the importance of mitochondria as the centres of respiration in the cell.

**Amino Acid Requirements of Man.**—Using diets containing known amounts of the various amino acids, W. C. Rose and coworkers established minimum amino acid requirements for man. The balance between N (nitrogen) intake and N excretion was used as the criterion for the adequacy of various diets fed to men. On a diet lacking an essential amino acid the amount of N excreted was more than was consumed in the diet. On a complete diet the amount of N excreted was equal to the amount of N consumed. The essential amino acids and the tentatively recommended daily intake (which is twice the minimum daily requirement) were found to be: tryptophane, 0.5 g.; phenylalanine, 2.2 g.; lysine, 1.6 g.; threonine, 1.0 g.; valine, 1.6 g.; methionine, 2.2 g.; leucine, 2.2 g.; and isoleucine, 1.4 g. The adult man does not need the remaining amino acids, including the amino acids histidine or arginine. The latter two are, however, essential for the growth of rats. It was not surprising that arginine is not needed, for it had been shown before that man manufactures considerable amounts of arginine. However, the discovery that adult man can synthesize all the histidine he needs was unexpected. Variability was found in the quantities of the various amino acids needed

by different people. However, for any single individual, the minimum requirements did not vary. These studies made it possible to evaluate the nutritional qualities of proteins for man and to prepare synthetic mixtures of amino acids for intravenous feeding of patients who cannot assimilate food normally. It should be mentioned, however, that patients receiving such mixtures require more calories than they do on a normal diet.

**Protein Synthesis.**—If the timing of the amino acid feeding to a rat is adjusted so that one of the essential amino acids is fed only several hours after the other amino acids have been eaten, the rat cannot grow, even though all the essential amino acids are included in the diet. Apparently incomplete amino acid mixtures are not stored in the organism or used to form intermediary building stones (plasteins) from which protein synthesis could proceed at a later time. It was also found that feeding of all the amino acids, essential and nonessential, promotes growth more effectively than feeding of the essential amino acids alone. It was concluded, therefore, that protein synthesis can occur only when the essential and nonessential amino acids are simultaneously available at the site of protein synthesis. Nothing was known, however, of the factors which control the retention of a given amino acid mixture for protein synthesis or the metabolism and excretion of other amino acid mixtures which are inadequate for protein synthesis.

**Hormones.**—Since the announcement in 1949 that cortisone (Compound E) and the adrenocorticotrophic hormone (ACTH) relieve the symptoms of rheumatoid arthritis, rheumatic fever and other so-called collagen diseases, efforts had been made to understand the relation of the chemical structure of these compounds to their biological activity. ACTH, which is produced by the pituitary gland and which functions by stimulating the production of cortisone by the adrenal glands, was shown by C. H. Li to be a protein of molecular weight about 20,000. In 1950 Li showed that small peptide fragments of molecular weight as low as 1,200 retain their biological activity. If the structure of these fragments could be determined and the fragments synthesized it would aid studies of the mechanism of hormone action and immeasurably supplement the limited amount of ACTH for treating patients. This was desirable since even the partial synthesis of the steroid cortisone was so complex that it would probably remain prohibitively costly on an industrial scale for a long time.

Numerous steroid compounds were tested without success for cortisone activity. The tissues of the body cannot elaborate cortisone from closely related compounds even by the introduction of ketone or hydroxyl groups or of a double bond at C<sub>4</sub>:C<sub>5</sub> in the cortisone nucleus. The adrenal gland itself appears to be the site of the enzymes which synthesize the active compounds. The many steroids which are found in the gland are possibly intermediate compounds which are retained within the gland and are not released upon stimulation until they have been converted into cortisone or the closely related Compound F. This conclusion was based on the fact that dehydrocortisone (Compound A) is almost devoid of physiological activity in the human being and on the fact that only cortisone and Compound F are found in the urine. It was also found that perfusion of the adrenal gland results in the release only of compound F and not of any of the other steroids known to be in the gland.

Experiments by W. C. Stadie and his coworkers cast doubt on the earlier suggestion from C. F. Cori's laboratory that insulin acts by relieving the inhibition caused by pituitary or cortical hormones on the hexokinase reaction. This reaction in which glucose is enzymically converted into glucose-6-phosphate, is obligatory in the metabolism of glucose. Stadie found that neither insulin nor adrenal cortical extracts affected the rate of the hexokinase reaction in extracts from depancreatized cats. He also got a similar negative result with muscle extracts from rats

made diabetic with alloxan. Stadie suggested that the earlier work on the effect of insulin on the hexokinase reaction was misleading because no correction was made for the presence of glycogen or glycogen breakdown products which interfere with the usual methods of measuring the hexokinase reaction. (See also ARTHRITIS; PHYSIOLOGY.)

**Birth Control.** During 1950 the Planned Parenthood movement began a long-range education, service and research program. This program, adopted the previous year by the Planned Parenthood Federation of America was: "To provide leadership toward universal acceptance of family planning as an essential element of responsible parenthood and stable family life." Intensified field work was carried on, especially on the Pacific coast. A program of work with minority-group families whose economic status denied them private medical care was expanded to educate them as to contraceptive clinic services available. Work was carried on with ten leading Negro organizations with the objective of encouraging their leaders to co-operate with national, state and local Planned Parenthood programs and to stimulate their interest in this health measure. Consultants also took part in courses or in family institutes under federation sponsorship in 23 Negro colleges as a method of interpreting the program to students who would one day take their places as community leaders.

The federation produced its first film *A Planned Parenthood Story*, designed to reach married couples in need of accurate information on how conception control could strengthen their family life.

**Awards.**—The sixth annual Albert D. and Mary Lasker Foundation Awards in Planned Parenthood went to Margaret Sanger, founder of the birth control movement and Bessie L. Moses, M.D., of Baltimore. Mrs. Sanger's citation read: "To Margaret Sanger, foremost in teaching families wise planning in birth control: Leader in influencing nations towards balanced population; living to see her beginnings in city slums grow into plans for a planet." Dr. Moses, obstetrician and instructor in obstetrics, Johns Hopkins university, was recognized for "her brilliant record of forwarding the cause of Planned Parenthood among the public and the medical profession."

**Research.**—During the year the federation established its own research program in human reproduction and three studies in fertility and infertility were carried over from a previous research project that had been sponsored with the National Research council's Committee on Human Reproduction and the National Committee on Maternal Health.

The final goal of research in this field was to develop a contraceptive method sufficiently simple, safe and effective to be used by families living in overpopulated world areas where existing methods cannot be widely disseminated because cost and complexity prohibit their use among illiterate submerged peoples.

Clinical and laboratory research in contraception and other phases of human fertility were also carried on during the year at the Margaret Sanger Research bureau.

The Planned Parenthood federation was in 1950 the national agency and clearinghouse for 15 state leagues and 98 local committees. Birth control clinics numbered 522. These services were in 252 public health departments, 52 hospitals and 190 extramural clinics and there were 28 referral services. Of the 162,377 yearly total of patients visiting birth control clinics in 1949, the majority or 150,693, were served in the extramural clinics sponsored by federation affiliates. Of the 67 infertility clinics, 16 were under Planned Parenthood auspices. (M. Sr.)

**Birth Statistics.** The steady decline in the birth rate for the United States from the postwar peak of 1947 continued into 1950. Provisional data covering the first nine months of 1949 and 1950 showed a 1% drop in births and a 2.9% drop in the birth rate; for each month, the birth rate in 1950 was below that of 1949. It was estimated that 3,581,000 births were registered in the United States during the entire year 1949, and that the birth rate was 24.1 per 1,000 population. However, when allowance was made for unregistered births, the total was estimated as 3,729,000, and the corresponding birth rate as 25.1 per 1,000 population. Canadian data covering the first eight months of 1949 and 1950 pointed to a practically unchanged birth rate. The record for Canada covering the whole of 1949 showed 353,894 births, with a birth rate of 26.9 per 1,000 population. For England and Wales, urban records for the first ten months of 1950 showed 5% fewer births than for the like period of 1949. There were altogether 731,568 births in all of England and Wales during the whole of 1949; the birth rate was 16.7 per 1,000 population. For the same year, New Zealand recorded 43,988 births (excluding Maoris), and a birth rate of 24.9 per 1,000 population; Australia then had a birth rate of 22.9 per 1,000.

There had been a steady improvement in the completeness of birth registration in the United States, largely as a result of the rapid rise in the proportion of babies born in hospitals. Thus, in 1940 only 55.8% of the births were attended by a physician in a hospital; this figure rose to 85.6% by 1948. Meanwhile the estimated completeness of birth registration increased from 92.3% in 1940 to 95.5% in 1948; in the latter year, the percentage was 97.1 for white births and 85.9 for nonwhite births.

Whereas 90.4% of the white births in 1948 were attended by a physician in a hospital, only 52.9% of the nonwhite births were so delivered. On the other hand, 8.1% of the white births were attended by a physician outside of a hospital, but 16.6% of the nonwhite births had this attendance. The remaining proportions, 1.5% of white births and 30.6% of nonwhites, were attended by a midwife or some other person.

Births per 1,000 U.S. Females of Stated Ages and Order of Birth, 1920, 1940, and 1945 to 1948

Age and order of birth	1948	1947	1946	1945	1940	1920
Births per 1,000 females of stated ages						
10-14 . . . . .	0.9	0.8	0.7	0.7	0.6	0.3
15-19 . . . . .	79.7	76.7	56.9	48.8	48.9	48.5
20-24 . . . . .	192.8	200.1	171.7	130.1	125.0	151.8
25-29 . . . . .	160.3	172.3	157.3	128.4	114.1	150.5
30-34 . . . . .	100.3	107.5	103.6	94.7	77.1	115.5
35-39 . . . . .	53.3	57.3	56.7	54.6	41.8	78.4
40-44 . . . . .	15.1	15.9	15.6	15.5	13.9	31.1
45-49 . . . . .	1.1	1.2	1.2	1.3	1.3	3.8
Births of stated order per 1,000 females of ages 15-44						
First . . . . .	38.5	45.1	36.7	27.2	27.0	29.7
Second . . . . .	29.9	29.0	26.5	21.5	18.3	20.9
Third . . . . .	15.5	14.8	13.7	12.5	10.0	15.1
Fourth . . . . .	7.6	7.5	7.3	6.9	5.8	10.8
Fifth . . . . .	4.2	4.2	4.2	4.1	3.6	7.7
Sixth and seventh . . . . .	4.3	4.3	4.3	4.3	4.2	9.5
Eighth and over . . . . .	3.3	3.3	3.4	3.5	3.7	7.9

The proportion of white births occurring in hospitals in 1948 was highest for the Pacific coast states (98.3%) and lowest for the east south central states (69.6%). For nonwhites, the corresponding proportions ranged from a high of 95.9% in the New England states to a low of 25.6% in the east south central states. In the urban area of the United States as a whole, 96.5% of the white births and 75.8% of the nonwhite births were in hospitals; for the rural area, the respective figures were 81.4% for the white and 24.4% for the nonwhite births.

It will be noted in the upper tier of the accompanying table that the birth rates among young women under 20 years of age moved upward sharply from 1920 to 1948, the latest year for which such data were available. For ages 20 and over, on the other hand, there was a sharp drop in the birth rates from 1920 to 1940; the recovery thereafter reached a high point in 1947. The rates at ages 20 to 29 for 1948 were not only well above those for 1940, but they were even higher than in 1920. Although the rates for ages 30 to 44 in 1948 were also higher than in 1940, they had not recovered to the level of 1920. In other words, women at the older reproducing ages were not bearing as many children as the generation before them. This may be viewed in another light from the data in the lower tier of the table.

It will be noted in the table that the rate at which women of ages 15 to 44 years had fourth children in the post-World War II years was less than three-quarters of that for 1920; in that year the rate was 10.8 per 1,000, compared with 7.6 in 1948. A like situation may be noted in the rates for fifth children. Another point of interest in these rates is their upward trend since 1940, something not apparent in the rates for sixth and higher orders of birth. The latter rates, from 1940 forward, were much less than half those of 1920; in fact, there was a decided downward trend in the rates for eighth and higher orders of birth.

A survey was made of plural births in 36,000,000 confinements in the United States from which at least one infant was born alive; the period of observation was from 1934 to 1947 and the results were published in the April 1950 issue of the *Statistical Bulletin* of the Metropolitan Life Insurance company. Twin births occurred at a rate of 10,589 per 1,000,000 confinements for white mothers and 13,062 for nonwhite mothers; for triplets the rates per 1,000,000 confinements were 98 for whites and 169 for nonwhites, while for quadruplets the figures were 1.1 and 5.0 respectively. Cases of plural births rose from a rate of 6,178 per 1,000,000 confinements at ages under 20 to a maximum of 17,247 per 1,000,000 at ages 35 to 39 years.

During the period from 1938 to 1948, the estimate of illegitimate births in the United States rose from 87,900 to 129,700, almost a 50% increase. Of the total illegitimate births for 1948, it was estimated that 55,500 were to mothers under 20 years of age, and 40,800 to mothers at ages 20 to 24 years; in other words, more than two-fifths of the illegitimate births had mothers under 20 and almost one-third had mothers 20 to 24. Illegitimate births occurred, in 1938, at a rate of 7.0 per 1,000 unmarried women of ages 15 to 44 years; the corresponding rate for 1948 was 12.7. However, over this period the ratio of illegitimate births to total births was rather stable at somewhat under 4%. Among white women, the rate of illegitimate births for 1947 was 6.3 per 1,000 at ages 15 to 44, while for the nonwhites it was 55.8; within this broad age range, the rates were at a maximum for unmarried women at ages 20 to 24 years, the figures being 10.9 per 1,000 for whites and 81.9 per 1,000 for nonwhites. Among both white and nonwhite unmarried women, the illegitimate birth rate was considerably higher in rural than in urban areas. (See also CENSUS DATA, U.S.; INFANT

MORTALITY.)

**Bismuth:** see MINERAL AND METAL PRODUCTION AND PRICES.

**Blind, Education of the.** In Europe, most of the schools for the blind closed during World War II had been reopened by 1950 and provided with replacements for books and devices, although many of the facilities were still very meagre. Publishing houses for the blind in many countries were again in operation, and one or two new ones had been established. In Asia, interest in the education of the blind had begun to show tangible results. Specifically, during 1950, a survey of the educational needs of Iran was made and a ten-year program of education mapped out and implemented. The government of India sent a representative to the United States for a nine-months' training period in braille printing, and the trainee returned to his country in the fall of 1950 to set up a new braille printing plant at New Delhi, the first one of its kind in that country. Equipment for the plant was shipped to India.

In the United States, as of Jan. 2, 1950, there were 5,606 pupils registered in 53 residential schools for the blind (one not reporting) and 662 blind pupils registered in 27 public school classes for the blind (one not reporting). During the year two schools were consolidated, the Piney Woods school, department for the blind, becoming the Mississippi School for the Colored Blind in conjunction with the Mississippi School for the Blind at Jackson, thereby attaining state support. In accordance with the act of 1879, congress made its annual appropriation of \$125,000 to the American Printing House for the Blind at Louisville, Ky. The money from this appropriation was used to manufacture (and distribute to the schools and classes for the blind on a per capita basis) braille books and magazines, talking books, large-type books and tangible apparatus for the education of the blind and near-blind.

Beginning with the 1950 fall session, there were approximately 8,000 partially visioned children enrolled in 662 sight-saving classes in the public schools of 237 cities of the United States and Hawaii. It was estimated that another 45,000 children with visual handicaps sufficient for eligibility in sight-saving classes were attending regular public school, mostly in rural areas and cities and towns too small to establish special classes for their benefit. The publication of textbooks in large type to parallel the most popular texts used by regular public school classes aided many of these children in keeping up with their normally seeing classmates.

Internationally, a survey of social aspects of the rehabilitation of blind children throughout the world was being conducted by a committee of the Social commission of the Economic and Social council of the United Nations. Further, at the request of the government of India, a ten-day conference was held in Paris in March under the auspices of U.N.E.S.C.O. to confer on internationalizing the braille system for all languages. The principles adopted by the conference for a world braille at that time were unanimously adopted by the general conference of U.N.E.S.C.O. in Florence, It., in June 1950, and provisions were made for working out the details of a world braille with its application to a number of linguistic groups. Regional conferences were planned for 1951 in the middle east (Arabic braille) and in Latin America (Portuguese and Spanish contracted brailles). The setting up of a small World Braille council was also approved by the general conference of U.N.E.S.C.O. to

assist in maintaining uniformity in braille practice throughout the world. A world educational conference was planned to be held in Amsterdam, Neth., in 1951 or 1952.

Education of the preschool blind continued to increase. In the United States in 1950, at least six schools for the blind held summer institutes for blind preschool babies and their mothers. Home visiting programs were conducted by agencies in two other states. Retrolental fibroplasia had become the largest single cause of congenital blindness, and its increased incidence had become apparent in the make-up of blind school populations. In Great Britain, two new Sunshine Homes for preschool blind children were opened.

Interest in the rehabilitation of the adult blind continued to increase greatly, receiving its single largest impetus from the program of rehabilitation provided by the government for the war-blinded after World War II. In most cases, 6- to 12-week courses were being conducted by public agencies for the blind in co-operation with the state vocational rehabilitation divisions which provided much of the funds. Much private help had also been used, such as Lions clubs, volunteers, etc. Because of the varying backgrounds and personality requirements of blind adults, most of these programs had provided only limited general programs, with greater emphasis on individual reorientation and training for new skills, or retraining for the use of old skills in spite of the handicap of blindness. Courses in "travel" to help the blind individual get about by himself had also proved very popular and successful.

**Blue Cross:** see INSURANCE.

**Bobsledding.** In 1950 a United States team led by Stanley Benham of Lake Placid, N.Y., roared down the icy Cortina course at Cortina d'Ampezzo, It., in record time

U.S. BOBSLEDDING TEAM on the Cortina d'Ampezzo track in Italy scene of the world championship run in which the U.S. team took the four-man title on Feb. 5, 1950

to defend successfully its world four-man championship. Entering the last half of the two-day competition behind the Swiss no. 1 team, the Americans gained a spectacular victory.

Trailing on elapsed time, the invaders careened over the 1,648-m. slide, with its 16 treacherous curves, in 1 min. 21.03 sec. to break the course mark of 1 min. 21.64 sec. set by the Swiss only 24 hr. earlier. The new standard gave Benham and his mates a total time of 5 min. 28.72 sec. for the four runs, against a combined clocking of 5 min. 29.56 sec. for their rivals.

Riding with Benham were Pat Martin of Massena, N.Y., Jim Atkinson of Rome, N.Y., and Bill D'Amico of Lake Placid.

Fritz Feierabend and Stefan Waser captured the two-man laurels to keep that title in Switzerland another year. Benham and Martin were the runners-up.

A scarcity of snow on the Mt. Van Hoevenberg run at Lake Placid prevented the holding of the national Amateur Athletic union championships.

(T. V. H.)

**Bolivia.** A landlocked republic in south central South America, Bolivia is bounded by Peru and Chile on the west, Brazil on the north and east, Paraguay on the east and Argentina on the south. Its estimated area, still unconfirmed because of continuing boundary disputes, is 416,040 sq.mi. Pop. (1949 est.) about 3,990,000 of which 52.34% was believed to be Indian, 27.5% mixed-blood and 13.08% white. The principal cities are La Paz, the seat of government (est. pop. 301,000), Cochabamba (80,000), Oruro (50,000), Potosí (40,000), Santa Cruz (33,000), Tarija (27,000) and the legal capital, Sucre (32,000). President in 1950: Mamerto Urriolagoitia.

**History.**—The political and economic history of Bolivia is strongly influenced by its pre-eminent industry which is mining. The latter includes about 16% of the world production of tin, which was in 1950 being exported in almost equal amounts to the United States and the United Kingdom. Miners' unions, with memberships estimated at about 310,000, were especially active in political affairs during the year and represented the principal strength of the two more aggressive minority parties, the leftist Partido de la Izquierda Revolucionaria and the rightist Movimiento Nacionalista Revolucionaria. Extensive strikes, political feuds in some part violent, abrupt official changes and a revolution in force, which disrupted mine operations in many areas during 1949, tended to abate during 1950 under the presidency of Mamerto Urriolagoitia.

Despite political tensions, 1950 marked many notable advances in Bolivia. The new petroleum industry produced more than 600,000 bbl. Improvements in primary education, now compulsory, were believed to have reduced prevalent adult illiteracy to about 75% as compared with an estimated 85% in 1945. The health ministry established the first clinics in six frontier areas which had never before had health services.

(C. M. Wi.)

**Education.**—Bolivia in 1944 had 1,513 rural schools with 110,000 pupils and 1,740 elementary schools with 144,056 pupils. Secondary education was furnished by 55 colleges (27 public and 28 private) with 17,496 students. There were universities with more than one faculty at Cochabamba, La Paz, Oruro, Potosí and Sucre.

**Finance.**—The monetary unit is the boliviano, valued on Nov. 30, 1950 at \$0.0165 U.S. currency, official rate; \$0.0099, legal free rate; and \$0.0049, curb rate. The 1950 budget balanced revenue and expenditure at 2,783,000,000 bolivianos. Revenue was derived mainly from export duties on minerals. The internal debt of national, departmental and municipal governments and autonomous institutions totalled 2,405,000,000 bolivianos on Nov. 30, 1949. The external debt was \$60,280,923 on Dec. 31, 1947, plus arrears of interest totalling \$74,244,100. Notes in circulation on Aug. 31, 1950, totalled 2,822,000,000 bolivianos; the gold reserve of the Central bank was \$22,800,000.

**Trade and Communications.**—Exports in 1949 amounted to \$107,100,000; imports were \$71,400,000. Tin accounted for about two-thirds of the exports. The U.S. and the United Kingdom were the principal customers and the U.S., Peru, Argentina and Chile, the principal suppliers.

Railway lines in operation (1945) totalled 1,612 mi. Several lines were under construction in 1950, including two from Brazil and Argentina, respectively, to Santa Cruz in the eastern lowlands. The highway system (1949) comprised an estimated 15,420 mi. of which 4,008 mi. were im-

proved. About 7,300 motor vehicles were in operation in 1947. The national air line, Lloyd Aereo Boliviano, carried 42,277 passengers and 9,513 short tons of cargo in 1948. Service in 1950 was also supplied by Panagra, Braniff Airways, Linea Aerea Nacional (Chile) and the Bolivian air force. More than 50% of the 8,300 telephones in 1948 were in La Paz.

**Agriculture.**—Bolivia continued to be dependent on imports of foodstuffs. Important crops included maize, barley, wheat, rice and potatoes. In 1948, 288 short tons of cocoa were exported. Livestock (1946) included an estimated 3,039,000 cattle, 4,289,000 sheep and 1,809,000 goats. The principal exploited forest products were rubber (1949 exports, about 2,000 short tons) and cinchona bark.

**Manufactures.**—In 1947, there were 1,964 factories, about 40% of which were located in or near La Paz. The most important products were textiles, wheat flour, beer, cigarettes, footwear, cement and glassware. The cost-of-living index for La Paz stood at 843 in July 1950 (1937=100).

**Mineral Production.**—Mining is Bolivia's chief industry and tin is the dominant factor in the nation's economy. Mineral exports in 1949 were reported as follows: tin 38,166 short tons; lead 29,048 tons; silver 6,622,900 oz.; copper 5,593 tons; zinc 19,432 tons; antimony 11,326 tons; and wolfram (WO<sub>3</sub> content) 1,701 tons. Production of crude petroleum totalled 678,200 bbl. (J. W. Mw.)

**Bonds:** see STOCKS AND BONDS.

**Book-Collecting and Book Sales.** Save for its last months the year 1950 was unexceptional. Midsummer visitors to Great Britain purchased rare books and manuscripts at bargain prices while on the continent there was a sharp stiffening of markets caused by the rise in western Germany of a group of buyers which, possibly through black-market profits, was able to compete with the world and most notably with the Americas. The libraries of certain royal and noble families came into the market. The most valuable single item offered was the only known example of Martin Waldseemüller's global map of the world (St. Dié, 1507), the property of Franz Josef II, reigning prince of Liechtenstein. The globe, the first to bear the name America, was offered at auction in New York with a reserve price of \$50,000; no bid was received in excess of that figure and the globe was returned unsold to its consignor.

In the United States the auction sales were of small importance until late in the year when two collections were offered: 1,220 non-Lincolnan selections from the manuscript collections of Oliver R. Barrett which realized \$74,815; and the first part of the library of Lucius Wilmerding which brought \$117,300 for 778 items offered. The most astonishing price of the year was \$3,500 paid at auction (New York) for the only recorded copy of Robert Frost's first book, *Twilight* (Lawrence, Mass., 1894).

Institutional collections were most active. The Houghton library, Harvard university, received as a gift from Gilbert H. Montague the family collection of Emily Dickinson's letters, manuscripts and papers. The Franklin D. Roosevelt papers at Hyde Park, N.Y. (about 5,000,000 pieces), were opened to the public with the exception of about 15% of the total which were to become generally available in 1975. William R. Coe gave \$500,000 to Yale university for the establishment of a chair in American history, thus supplementing his 1948 gift to Yale university of his tremendous collection of western Americana. The University of Buffalo, N.Y., was the recipient of papers and manuscripts of James Joyce. Mrs. Robert C. Taylor presented her collection of American fiction (1770-1950) to the University of Virginia, Charlottesville. Henry L. Mencken gave his papers and manuscripts to the Enoch Pratt Free library, Baltimore, Md. Yale acquired what was believed to be the last portion of the private papers of James Boswell. The daughter of F. Scott Fitzgerald presented her father's files and manuscripts to the Princeton university library. The New York Public library received \$1,750,000 as a bequest from Albert A. Berg.

The *New Colophon: A Book Collectors' Quarterly* became an annual with the issue of Jan. 1951; in Chicago, Ill., the *Amateur*

*Book Collector* was founded as a monthly; and in Great Britain the *Clique*, organ of the antiquarian book trade, continued its books for sale section, incorporating it into another magazine, the *Book Market*.

The Fourth International Congress of Antiquarian Booksellers met at Paris with more than 100 delegates representing 12 nations. The United States, for the first time, was officially represented.

There was a marked increase in the number of books issued devoted wholly or in part to bibliophily and kindred subjects: *Standards of Bibliographical Description* by Curt F. Bühler, James G. McManaway and Lawrence C. Wroth; *The Popular Book* by James D. Hart; *The Scholar Adventurers* by Richard D. Altick; *Book-Collecting*; *More Letters to Everyman* by Percival Muir; *Principles of Bibliographical Description* by Fredson Bowers; *Carroll A. Wilson, Thirteen Author Collections of the Nineteenth Century, and Five Centuries of Familiar Quotations*, edited by Jean C. S. Wilson and David A. Randall; *The House of Beadle and Adams, and its Dime and Nickel Novels* by Albert Johannsen; *A Bibliography of John Dos Passos* by Jack Potter; and others of some interest. (J. Bk.)

**Book Publishing.** New books and new editions issued in the United States in 1950 were up 130 over the total of 1949, an increase of 1%; but the 1950 total of 11,022 was only slightly below the all-time high of 1940 when 11,328 titles were issued, and about 10% more than the 1930 total. Fiction, representing 17% of the year's output, showed the largest net increase of the year, followed by juveniles, general literature and technical books. The largest net decreases were for the categories of domestic economy and business. About 13% of the titles handled during the year were imports.

The five leading publishing houses of the year were Macmillan (426); Doubleday (with Blue Ribbon Books, Garden City, Halcyon House, PermaBooks and Sun Dial Press) (402); McGraw-Hill (with Gregg Publishing company and Whittlesey House) (330); Harper (305); and Oxford (296).

Newsstand titles of pocket books showed an increase of 281 new titles over the 1949 total of 659, with an estimated total of 214,000,000 copies sold in 1950.

**Best Sellers.**—Heading the best-seller list for fiction in 1950, based on trade sales alone, was *The Cardinal* by Henry Morton Robinson, the only novel on the list with a religious theme. Second was *Joy Street*, by Francis Parkinson Keyes, which did not appear in the bookstores until the last month of the year. Third to tenth on the list, in that order, were *Across the River and into the Trees*, by Ernest Hemingway; *The Wall*, by John Hersey; *Star Money*, by Kathleen Winsor; *The Parasites*, by Daphne du Maurier; *Floodtide*, by Frank Yerby; *Jubilee Trail*, by Gwen Bristow; *The Adventurer*, by Mika Waltari; and *The Disenchanted*, by Budd Schulberg. There were no carry-overs from the 1949 list, although three of the authors (Keyes, Yerby and Waltari) had been represented by other works. All but Robinson, Bristow and Schulberg, however, had been represented on best-seller lists in previous years.

The list of nonfictional best sellers for the year, based on trade sales alone, was topped by *Betty Crocker's Picture Cook Book*, followed in second place by *The Baby*, a book of humorously captioned photographs. These were followed, respectively, by *Look Younger, Live Longer* by Gayelord Hauser; *How I Raised Myself from Failure to Success in Selling*, by Frank Bettger; *Kon-Tiki*, by Thor Heyerdahl; *Mr. Jones, Meet the Master*, by Peter Marshall; *Your Dream Home*, by Hubbard Cobb; *The Mature Mind*, by H. A. Overstreet; *Campus Zoo*, by Clare Barnes, Jr., another humorous picture book; and *Belles on Their Toes*, by Frank B. Gilbreth, Jr., and Ernestine Gilbreth

Carey. Reckoned by total sales, including mail and bookstore sales, *Your Dream Home* actually topped the list. Of the ten nonfictional best sellers, all but *Kon-Tiki* and *Belles on Their Toes* were considered nonreading books among the trade, the others being classified under self-help, "how-to" books and picture books.

One publishing innovation of the year was Simon & Schuster's experimental issuance of new titles in full-priced hard-cover and low-priced (\$1) paper-covered editions simultaneously. This was done with *The Cardinal*, leading fictional best seller of the year, with encouraging results. Among booksellers, however, as evidenced after questioning by the American Book Publishers council, the preference was for a one-year lag between first editions of fiction and hard-cover reprints, and for a year and a half between hard-cover and paper-bound reprints. Price news in the pocket-book field included the issuance of giant-sized reprints at 35 cents instead of the usual 25 cents, a notable example being the two-volume reprint of Robert E. Sherwood's *Roosevelt and Hopkins*.

During the year, 19 nations signed an agreement drawn up by the United Nations Educational, Scientific and Cultural organization to abandon customs barriers in the book trade. (X.)

**Great Britain.**—During 1950 book publishers in Great Britain produced 17,072 titles of which 5,334 were reprints and new editions. It was considered that the 1950 total, slightly larger than the 1949 total of 17,034 titles and slightly smaller than the 1937 total of 17,137 titles, which was the highest figure ever recorded, might indicate that book publishing had attained its full rate of output after ten years of restricted production.

The period April 1949-March 1950, after nine years of paper rationing, was the first year in which British book publishers were wholly free from the governmental control of their chief raw material. Reviewing that first year of freedom, the Publishers' association, in a report issued in March 1950, stated that the two most fundamental problems were a fall in the sale of individual titles and the consistent rise in the costs of production. In Nov. 1950 paper, once 1½d. a pound, was 10d. a pound, printing was four times what it was in 1939 and the rise in binding costs was higher still. By contrast the published prices of many categories of books in 1950 were only one and one-half times what they had been before World War II. The reason for this apparent anomaly was that publishers, during the years of restricted output, had been able to sell every copy of every book they could manufacture.

The pattern of book publishing suddenly took on a new shape; at the beginning of the year the papermakers had complained of a rapid and unexpected change from the seller's to the buyer's market, but by the summer of 1950 the position had reversed it-

self once more. The world shortage of raw materials and the heavy demand for Scandinavian pulp by the U.S. brought about a dramatically sudden and sharp deterioration in the paper supply situation in Great Britain. An impending shortage of straw-board for bookbinding was scarcely less serious.

Yet the publishing business continued quarter by quarter to beat all previous records in the volume of business done. The amount of trade done by publishers in 1949 had reached the unprecedented figure of £34,297,252 (the average annual total before World War II was approximately £10,000,000). During the first six months of 1950 publishers' total sales amounted to £16,683,895, an increase of more than £834,000 on the turnover of the corresponding period of 1949. Since the book-trade business had invariably been greater in the second half of the year than in the first, there was little doubt that the 1950 total would surpass the 1949 record. (See also AMERICAN LITERATURE; ENGLISH LITERATURE; etc.) (E. SE.)

**Books:** see BOOK PUBLISHING; CHILDREN'S BOOKS; LITERARY PRIZES; see also under AMERICAN LITERATURE; ENGLISH LITERATURE; FRENCH LITERATURE; etc.

**Borneo:** see BRITISH BORNEO; INDONESIA.

**Boston**, the capital of Massachusetts and the tenth largest city in the United States, had a population of 790,863 by the 1950 federal census, preliminary figures, an increase of 20,000 over 1940, and a land area of 43.9 sq.mi. John B. Hynes was installed as mayor on Jan. 2, 1950, being the 43rd individual to hold this office since 1822.

Important traffic developments during 1950 were the purchase of 3,000 additional parking meters, bringing the total number to 8,000, and the installation of 50 automatic traffic signals at dangerous intersections. The first off-street parking garage was opened, and plans for two others were under way; the Reconstruction Finance corporation approved a \$12,000,000 loan for a Boston Common underground garage. Three main thoroughfares were totally reconstructed, with two others planned. Construction was started on a new viaduct, to cost \$2,600,000, connecting Long Island, site of a large hospital, with the mainland. A new fire headquarters building costing \$2,000,000 was nearing completion.

The city adopted a plan for classification and compensation of 12,500 city and county employees. The work week for police officers was reduced by a referendum vote of the electorate in November from one day off in six to a five-day week. This action would make necessary the addition of 300 patrolmen to the police department, at a cost in excess of \$1,000,000.

The net debt of the city was reduced by \$1,500,000 in 1950, thus reversing an upward trend of the preceding three years. Borrowings for current maintenance purposes were eliminated. The 1950 tax rate was \$63.00 (1949 \$56.80) on an assessed valuation (real and personal) of \$1,567,500,000, a decrease of \$33,931,500 from the previous year. Budgets (city and county) amounted to \$86,554,244.50, an increase of \$4,636,561.70 over 1949; (schools) \$26,550,986.14, an increase of \$826,541.80. (C. J. Fx.)

**Botany.** An outstanding event of interest to botanists in 1950 was the seventh International Botanical congress in Stockholm, Swed., during July. More than 1,500 botanists from 39 countries participated, and in excess of 600 papers were presented. Special meetings were held for the sections on nomenclature, palynology (pollen study) and for the botanical section of the International Union of Biological Sciences. Of particular interest was the unexpected and last minute arrival of delegates from the U.S.S.R. Several other events of special

interest were held during the year. American botanical and genetical societies met at Columbus, O., in September under the auspices of the American Institute of Biological Sciences to celebrate the 50th anniversary of the rediscovery of Johann Gregor Mendel's work. The British Association of Science held its annual meeting in Birmingham on Aug. 30, and W. B. Turrill discussed modern trends in classification in his presidential address before the botanical section. In June a celebration was held at the opening of the new John Innes Horticultural institution at Bayfordbury with 500 visitors in attendance.

A number of significant honours befell to botanists in 1950. John Walton received the Neill prize of the Royal Society of Edinburgh for his contributions to the knowledge of carboniferous palaeobotany. H. N. Ridley received the Linnean medal and F. E. Fritsch was elected president of the Linnean Society of London for 1950. New fellows of the Royal society included T. A. Bennett-Clark and G. H. Cunningham; Carl Skottsberg was elected a foreign member. H. G. Lundegårdh was elected a foreign member of the American academy. Among new members elected to the National Academy of Sciences were James Bonner and David R. Goddard. John T. Buchholz was appointed correspondent of the National Museum of Natural History of Paris. E. B. Babcock was elected an honorary member of the Royal Botanical Society of Belgium.

During the year great interest was shown in the study of growth regulating substances. H. B. Currier and A. S. Crafts announced that a new herbicide, maleic hydrazide, may be useful for controlling weed grasses, and D. G. White showed that blossoming of fruit plants is delayed by this substance. V. A. Greulich and Earlene Atchison suggested that low concentrations of maleic hydrazide inhibit cell divisions whereas higher concentrations inhibit both cell division and cell enlargement. A. W. Naylor and E. A. Davis showed that maleic hydrazide, unlike most of the other growth regulators, has remarkably similar effects on both monocots and dicots. From these studies it is clear that maleic hydrazide may have important theoretical and practical value. Seward E. Allen and Folke Skoog studied the growth regulatory activities of imidazolines and related compounds and suggested that imidazoline derivatives may be of use as weed killers. New possibilities for weed control by presowing applications of isopropylphenylcarbonate and 2, 4-D were announced by W. G. Templeman and J. O. Wright. In another important physiological study Edwin A. Davis, using normal and mutant strains of *Chlorella*, obtained evidence that light does not have a direct effect on respiration and that "photorespiration" does not exist.

Significant research in a number of other fields appeared during 1950. Meta S. Brown in a study of cotton from Bikini showed that gamma radiation released during the explosion of an atomic bomb produces changes in chromosome structure, and Luther Smith found effects on barley and other cereals from atomic bomb ionizing radiation equivalent to 16,000r of X-rays. In a study of yeasts Ö. Winge and C. Roberts found what appeared to be non-Mendelian segregation and upon investigation discovered that the yeast asci had produced eight rather than the normal four spores. They suggested that the occurrence of an additional nuclear division in the ascus may explain other exceptions to the classical ratios which had been reported in yeasts. The cultivated cottons, *Gossypium barbadense* and *G. hirsutum*, produce a fully fertile vigorous  $F_1$  hybrid, but in the  $F_2$  considerable weakness and sterility appear. A theory to account for this involving multiple gene substitution had been put forward by S. C. Harland. S. G. Stephens, who had re-examined the evidence, suggested that cryptic structural differentiation of the chromosomes may also help explain some of the genetic peculiarities of the cottons. A cytotaxonomic investigation of the alga *Spirogyra* by M. B. E. Godward revealed that the species are well differentiated by the

numbers and characters of the chromosomes. This study was of particular interest in that hitherto most cytotaxonomic studies had been made on higher plants. C. M. Rick, investigating pollination relations in tomato, found much higher rates of natural cross-pollination within the natural range of the species than outside it. Flora M. Scott presented evidence that the surface membranes of nuclei are perforated by nucleodesmata just as protoplasts of individual cells are interconnected by plasmodesmata. C. L. Wilson in an anatomical study of the tropical family Melastomaceae suggested that the unique staminal appendages have not arisen in connection with pollination as generally supposed but are evolutionary remnants of branch systems. During the year another new antibiotic, terramycin—so called because it was isolated from soil samples—was announced by scientists at the research laboratories of Chas. Pfizer & Company. **Arboretums and Botanical Gardens.**—During 1950, Russell J. Siebert, formerly of the Missouri Botanical garden, was appointed director of the Los Angeles State and County arboretum at Arcadia, Calif. Maunsell van Rensselaer, director of the Santa Barbara Botanic garden, resigned because of ill health.

The secretary of agriculture, Charles Brannan, dedicated a memorial tree (*Cedrus deodara*) on the grounds of the National arboretum in Washington, D.C., during the 50th anniversary of the American Association of Nurserymen in July, while the Morris arboretum in Philadelphia, Pa., started extensive studies in breeding rhododendrons and azaleas.

The educational program of the Morton arboretum at Lisle, Ill., with instruction in nature study, continued to be tremendously popular with schoolteachers and students alike. *Plants and Gardens*, publication of the Brooklyn Botanic garden, reached nearly 10,000 subscribers during the year. The Long Island Agricultural and Technical institute at Farmingdale, N.Y., began to conduct a few studies in plant materials on the 400-ac. W. R. Coe estate in Brookville, now under its general supervision.

Donald Wyman of the Arnold arboretum was presented the first Norman Jay Colman award of the American Association of Nurserymen for "aiding horticulture through research" in the studies of woody ornamental plants. (See also HORTICULTURE.)

(D. WN.)

At the Cambridge Botanic garden, H. Gilbert-Carter retired from the post of director and university lecturer in botany after many years' service. He marked his year of retirement by the publication of a *Glossary of the British Flora* (Cambridge, 1950). J. S. L. Gilmour, the director of the Royal Horticultural society's gardens at Wisley, was appointed to succeed him. At Edinburgh, Roland E. Cooper retired from his post as curator and was succeeded by E. E. Kemp.

(P. M. SY.)

**Bowling.** Knocking down 1,981 pins, Frank Santore of Long Island City, N.Y., captured all-events laurels in the American Bowling congress tournament at Columbus, O., in 1950. Other winners included Everett Leins of Aurora, Ill., with 757 in the singles; Willie Ebosh and Earl Linz of Cleveland, O., who won the doubles with 1,325, and the Pepsi-Cola team of Detroit, Mich., which carried home the five-man championship after bowling 2,952. The only titleholder to repeat was the E. and B. team of Detroit, which retained five-man all-events honours with 8,978.

In the 33rd annual championships of the Women's International Bowling congress at Columbus, Mrs. Marion Ladewig of Grand Rapids, Mich., captured the all-events crown, Cleo Stalkamp of Newport, Ky., the singles, Shirley Gantenbein and Flo Schick of Dallas, Tex., the doubles, and the Fanitorium Majors of Grand Rapids, Mich., took team laurels.

The top prize of \$2,000 in the national match-game championships at Chicago, Ill., in December went to Dick Hoover, 21, of Akron, O., who tallied 305.29 points under the Petersen scoring system. Mrs. Ladewig scored 151.46 points to retain the women's championship.

Ed Easter and Eddie Lubanski, Detroit, kept their world match-game laurels by turning back the challenge of Andy Vari-papa, Hempstead, N.Y., and Connie Schwoegler, Madison, Wis. The champions won the 48-game match by 285 pins.

More than 200 keglers took part in the third international tourney for the blind held at Philadelphia, Pa. John Maier of New York scored 564 to win the singles and 1,616 to annex the all-events prize. A pair of Philadelphians, R. Bonavita and T. Reago, rolled 1,008 to take the doubles.

On May 12 the A.B.C. erased from its books a 34-yr.-old rule restricting membership to white males; the end of the colour bar became effective Aug. 1. The Women's International congress also voted, on June 5, to drop the racial clause from its by-laws.

(T. V. H.)

**Bowls:** see LAWN BOWLING.

**Boxing.** An attempt by Joe Louis to regain the world heavyweight championship title from Ezzard Charles highlighted boxing during 1950. Box-office receipts and attendance figures for the sport in the United States remained in the moderate range. No gate receipts reached the \$400,000 level. No event attracted as many as 40,000 people. The International Boxing Club, Inc., with its boxing monopoly in New York city, Chicago, Detroit and St. Louis, grossed slightly in excess of \$2,000,000 for a year's activity. More than half this sum was attracted to their promotions in Madison Square Garden, Yankee stadium and St. Nicholas arena in New York city. Madison Square Garden attracted 225,000 onlookers and grossed \$875,000 in receipts for 25 boxing shows. This compared with crowds aggregating 227,154 and receipts of \$804,081 for 21 shows there in 1949.

Observers attributed this comparatively static situation to two conditions; lack of good fighters and the effects of television on attendance. Steps to correct the first were under way as the year ended. Development of talent was the paramount issue. With respect to television, however, difficulties were growing. The argument was advanced that television keeps fans away from the ringside and the echo was found in a campaign for countermeasures to meet a situation which found reduced incomes the lot of boxers who were the media for the growing popularity of television in its relation to sports.

A virtual strike of New York's Boxing Managers' guild early in the year resulted in a compromise which brought increased income for boxers from television receipts. The campaign as the year ended, however, was to effect an agreement whereby income from television would be lumped with dwindling box-office re-

ceipts as the pay-off basis for boxers.

Emphasizing the television situation was the fact that two bouts held during 1950 which were not televised attracted the largest box-office receipts. Defending his world middleweight championship in Madison Square Garden July 12, Jake La Motta, New York, retained the title against Tiberio Mitri, Italy, before a crowd of 16,369 which paid receipts of \$99,841. On Sept. 8, at Yankee stadium, New York, Sandy Saddler, New York, lifted the world featherweight championship from Willie Pep, Hartford, Conn., before a crowd of 38,781 which paid receipts of \$262,118. Neither bout was televised.

The Saddler-Pep bout was the year's highest in attendance and box-office receipts.

Largest receipts on an over-all basis, however, were produced by Louis' comeback effort against Charles in the Yankee stadium Sept. 27. This bout attracted only 22,357 and the receipts amounted to \$204,843. However, the sum of \$146,000 from television and radio contracts boosted the receipts to the highest for the year. Louis lost the decision to Charles in a bout which accentuated the deterioration of the once-famed "Brown Bomber," who had announced his retirement in 1949 following his second defeat of Jersey Joe Walcott in 1948. Louis came out of retirement as boxing director for the I.B.C. when he decided to return to the ring in a bid to regain his title against Charles. The latter was recognized as champion by the National Boxing association. This recognition covered most of the United States. The state of New York withheld recognition until the Sept. 27 bout, in which Louis, only a faint reminder of the superlative boxer-fighter he once was, absorbed a thorough beating. Charles won a decision in 15 rounds and became recognized as champion in the United States. However, Lee Savold, Paterson, N.J., was recognized as heavyweight champion in Great Britain and Europe, on the strength of a four-round knockout victory he scored over Bruce Woodcock, in London, Eng., June 6, in a bout recognized abroad as a world heavyweight championship match.

All told, 12 championship bouts were held in various sections of the world during 1950, involving seven of the eight standard ring divisions. Four new champions were produced. In addition to Saddler, they were: Dado Marino, Hawaii, in the flyweight class; Vic Toweel, South Africa, in the bantamweight class; and Joey Maxim, Cleveland, O., in the light-heavyweight class.

During 1950 Pep twice successfully defended his featherweight title before succumbing to Saddler. At St. Louis on Jan. 16, Pep knocked out Charley Riley, St. Louis, in 5 rounds of a scheduled 15-round bout, and, on March 17, in Madison Square Garden, Pep won a 15-round decision over Ray Famechon of France. Saddler received credit for a knockout in seven rounds in winning the title from Pep Sept. 8, when Pep sustained a dislocated shoulder and was unable to respond for the eighth round.

La Motta's title defense against Mitri was one of two in which the champion engaged. La Motta followed this with a knockout victory over Laurent Dauthuille, France, in the 15th round of a championship battle waged at Detroit, Mich., Sept. 13. Maxim succeeded to the world light-heavyweight title on Jan. 24, by knocking out Freddie Mills, England, in ten rounds, at London, Eng. Ike Williams, Philadelphia, Pa., did not once defend his world lightweight championship during 1950.

Marino acquired the world flyweight title Aug. 1 by winning a 15-round decision over Terry Allen, London, Eng., at Honolulu, T.H. Allen had gained the title April 25, by winning a 15-round decision over Honore Protesi in London, Eng. Toweel succeeded Manuel Ortiz, El Centro, Calif., as world bantamweight champion, by winning a 15-round decision in a bout held May 31 at Johannesburg, U. of S. Af. Ray Robinson, world welterweight champion, retained his title by winning a decision in 15 rounds over Charley Fusari in Jersey City, N.J., Aug. 9.

JOE LOUIS (left) taking a hard right from Ezzard Charles in the 14th round of their 15-round bout for the world heavyweight title at Yankee stadium, New York city, on Sept. 27, 1950. Charles won by unanimous decision

Nine fatalities were recorded in amateur and professional boxing on a world-wide basis through the year. Three of these occurred in the United States. Two of the fatalities followed bouts in the St. Nicholas arena, New York city. On Feb. 23 Lavern Roach, Texas, died following a bout there with Georgie Small. On Dec. 21 Al ("Sonny Boy") West, Washington, D.C., died following a bout there with Percy Bassett. The other fatality in the United States occurred Dec. 7 when Sam (Johnny) Lopez, Richmond, Calif., died following a bout against Joe Madrid at Merced, Calif. (J. P. D.)

**Great Britain.**—Four British championships changed hands during 1950. The main event of the year was the defeat of Bruce Woodcock on Nov. 14 by Jack Gardner, a 24-year-old small holder and former guardsman from Market Harborough in Leicestershire, who had previously been an amateur champion.

Gardner's ability to absorb extreme punishment had brought him through his early trials as a professional. His victory over the Welshman Johnny Williams, a young man of immense talent but short of the desired stature for a heavyweight, was the bit-terest, most savage and most discussed fight of the year.

Freddie Mills lost the world light-heavyweight championship to Joey Maxim of the United States. He then retired, and Don Cockill defeated Mark Hart for the vacant British championship.

The middleweight championship changed hands twice: first Albert Finch won it from Dick Turpin; then Randolph Turpin, Dick's young brother, knocked out Finch, who had had to waste to make the weight and was so weak that this defeat could be dis-regarded in a survey of his prospects in the cruiserweight class. Randolph Turpin, a 22-year-old natural middleweight, was a great and ruthless puncher but neglected the methods of softening up an opponent and boxing for the winning opening.

Eddie Thomas did not have to defend his welterweight cham-pionship in 1950. Billy Thompson retained the lightweight cham-pionship against the challenge of Tommy McGovern. Danny O'Sullivan, the bantamweight champion, was badly punished by

the Spaniard Luis Romero, in a European championship match. There was no British flyweight champion. Since the retirement of the Ulsterman Rinty Monaghan, Terry Allen won the world and European titles and later lost both to Dado Marino (Hawaii) and Jean Sneyers (Belgium)

**Boy Scouts:** see SOCIETIES AND ASSOCIATIONS.

**Bradley, Omar Nelson** (1893— ), U.S. general, was born on Feb. 12 in Clark, Mo. He was graduated from the U.S. Military academy at West Point, N.Y., in 1915 and became a major of infantry in World War I. During World War II he commanded the 2nd corps in Africa and Sicily, and subsequently all U.S. ground troops for the inva-sion of Europe. As commander of the 12th U.S. army group he commanded more than 1,300,000 combat troops—the largest body of U.S. soldiers ever to serve under a single field command-er. By the end of the war he was a full general. From Aug. 15, 1945, to Dec. 1, 1947, he was administrator of veterans' affairs. On Feb. 7, 1948, he succeeded General of the Army Dwight D. Eisenhower as army chief of staff, and on Aug. 16, 1949, he be-came first permanent chairman of the U.S. joint chiefs of staff.

Shortly after the outbreak of the Korean war in mid-1950, General Bradley went to Tokyo, Japan, to confer on far eastern strategy. He also accompanied Pres. Harry S. Truman to Wake Island in October for the meeting with Gen. Douglas MacArthur. On Aug. 22 he warned the senate armed services committee that world conditions made it necessary to have either larger perma-nent forces or a system enabling quick mobilization of trained units. Even at the height of the Korean war, he more than once warned the U.S. of the critical nature of the "cold war" in Eu-rope, declaring that the greatest danger was that once the Korean war was won the U.S. would "let down its guard." In September congress voted him the rank of general of the army, and Presi-dent Truman presented him with his five-star insignia.

**Brannan, Charles Franklin** (1903– ), U.S. secretary of agriculture, was born on Aug. 23 in Denver, Colo., and was graduated from the University of Denver law school in 1929. He practised law in Denver until 1935, when he became assistant regional attorney of the Resettlement administration, and later regional attorney in the department of agriculture's office of the solicitor. From Nov. 1941 to April 1944 he was regional director of the Farm Security administration for Colorado, Wyoming and Montana. He was named assistant secretary of agriculture in June 1944 and secretary of agriculture in June 1948.

In 1949 Brannan put forward the "Brannan plan" for farm price supports to be based on a minimum farm purchasing power, which would be subsidized by government payments. This legislative proposal was not enacted by congress, although Brannan and other administration leaders continued to press for it during 1950. He charged that failure to enact his plan was the cause of such occurrences as dumping millions of dollars of surplus agricultural products which had been purchased by the government. On Aug. 22, 1950, Brannan declared that the government had huge surpluses of dairy foods and dried eggs, in danger of spoiling if not given away. Under President Truman's defense mobilization plan announced Sept. 9, Brannan was given cognizance over food, farm equipment and commercial fertilizer. (See also AGRICULTURE.)

**Brazil.** A federal republic in eastern and central South America, Brazil is the largest of the Latin-American nations. Language: Portuguese; religion: predominantly Catholic. Chief cities: Rio de Janeiro, the capital (est. pop. 1950, 2,408,000; São Paulo (2,213,000); Recife (530,000); Salvador (424,000); Pôrto Alegre (400,000); Belo Horizonte (300,000); Fortaleza (280,000); Belém (259,000).

President (since Jan. 31, 1946, and until Jan. 31, 1951): Gen. Eurico Gaspar Dutra.

Brazil's area of 3,286,170 sq.mi. is nearly half of South America and second only to that of Canada in the western hemisphere. The population (census, July 1, 1950) was estimated at nearly 50,000,000. Three-fourths of this population is concentrated in a narrow area along the coast. About 8,200,000 (one-sixth of the total) live in the 25 most important cities.

**History.**—General elections were held on Oct. 3, 1950. More than 50,000 candidates registered for offices in the national, state and municipal governments. According to data published by the superior electoral court, there were 11,299,692 registered voters.

Efforts of the National Democratic union (U.D.N.) and the Social Democratic party (P.S.D.) to come to an agreement as to a common candidate for president failed. As a consequence, each party maintained the right to present its own candidate. After party conventions, held in May and June, the following candidates were announced and later registered with the superior electoral court: Getulio Vargas (former president of Brazil) by the Brazilian Labour party (P.T.B.); João Mangabeira, by the Brazilian Socialist party (P.S.B.); Cristiano Machado, by the Social Democratic party (P.S.D.); and Brigadier Eduardo Gomes, by the National Democratic union (U.D.N.).

At the end of the year, although Getulio Vargas had been unofficially recognized as the victor at the polls, and President Dutra was allegedly planning to leave the presidential palace in the first week of January to allow for alterations suiting his successor, no official certification had been issued by the superior electoral court.

When, at the end of the year, the United States requested the Organization of American States to call a meeting of the foreign ministers of the American nations to consider present circum-

\*Area in dispute between the states of Minas Gerais and Espírito Santo. †1950.

stances of economic and defense problems of the hemisphere, Brazil was one of the first to accede to the proposed meeting.

The Communists intensified their agitation campaign in various parts of the country during the latter part of the year. Alleged Communist infiltration in the armed forces led to a strong protest from a group of army officers against the policy pursued by the Military club's magazine which had published an article denouncing the preparation for armed participation in the Korean war. As a consequence, the magazine suspended its publication.

At the end of the year the chamber of deputies approved a special credit of Cr\$ 50,000,000 (about U.S. \$2,500,000) as a Brazilian contribution to the United Nations' war effort in Korea.

The relations between Brazil and the U.S. were somewhat strained by charges of the U.S. senate agricultural subcommittee (headed by Sen. Guy Gillette), that speculative manoeuvres and trading were the cause of the sudden rise in the price of coffee. Senator Gillette's declarations that coffee growers in Brazil were deliberately withholding supplies in order to create an artificial shortage and a consequent rise in price were keenly resented by Brazilian growers and traders.

On the other hand, a new shipping decree which went into effect on March 1, requiring the payment in cruzeiros of ocean freight charges on all merchandise imported into Brazil caused resentment among U.S. steamship operators. Representations of the latter went without effect. U.S. shipping lines were compelled to increase freight rates by a reported 5% to offset losses.

**Education.**—There were in 1950 about 60,000 primary schools with 150,000 teachers and 4,500,000 students. Illiteracy was estimated at about 55% for the whole country. There were approximately 1,500 secondary schools with 300,000 students; 2,700 professional schools with 200,000 students; and 7 official universities. There were also three private universities maintained by the Catholic Church (at Rio de Janeiro, São Paulo and Pôrto Alegre).

**Finance.**—The cruzeiro, the monetary unit of Brazil, divided into 100 centavos, sold in the free market at rates between 25 and 28 per U.S. dollar. The official rate established by the Banco do Brasil remained 18.38. The foreign debt, which amounted to Cr\$ 10,013,599,633 (about U.S. \$507,000,000) on Dec. 31, 1945, had dropped to Cr\$ 5,620,042,153 (U.S. \$280,000,000) as of Oct. 30, 1950, a reduction of more than 43% in five years.

Money circulation increased from Cr\$ 18,400,000,000 (U.S. \$920,000,000) on July 1, 1949, to Cr\$ 29,430,517,368 (U.S. \$1,470,000,000) as of Nov. 30, 1950.

With supplementary and extraordinary credits, the government's expenditures were estimated at Cr\$ 24,627,000,000 (U.S. \$1,230,000,000) and the income at Cr\$ 19,000,000,000 (U.S. \$950,000,000), with a resulting deficit of Cr\$ 5,627,000,000 (U.S. \$280,000,000).

Foreign capital investments in Brazil were estimated at Cr\$ 15,491,734,252 (U.S. \$775,000,000) at the beginning of the year. Fifty-three

per cent of this amount was U.S. capital.

**Trade.**—Brazil exported 1,796,334 tons of merchandise worth Cr\$ 11,607,000,000 (U.S. \$580,000,000) between Jan. 1 and July 31, 1950. During the same period Brazilian imports amounted to 4,576,678 tons valued at Cr\$ 9,575,428,000 (U.S. \$475,000,000) leaving a favourable trade balance of Cr\$ 2,031,521,000 (U.S. \$105,000,000) during the first seven months of the year.

On June 14, 1950, Brazil announced negotiations with Great Britain for a trade agreement valued at £95,000,000 sterling. Brazil and Germany concluded a trade agreement providing for Brazilian exports valued at U.S. \$75,000,000 to western Germany in return for U.S. \$125,000,000 worth of German goods. A new agreement was also signed between Brazil and Czechoslovakia whereby Brazil would receive U.S. \$15,000,000 worth of machinery, agricultural equipment, chemical and pharmaceutical products, automobiles and other manufactured goods in exchange for hides, cotton, cocoa, wool, carnauba wax and mica. Another exchange agreement was signed with Austria, amounting to U.S. \$8,000,000.

**Communications.**—There were about 36,000 km. of railroad track in operation and about 300,000 km. of surfaced roads. It was estimated that there were in the country approximately 400,000 automobiles. There were about 130,000 km. of air routes in operation, and approximately 69,000 km. of telegraph lines.

The final link of Brazil's north and south by railroad was completed early in the year when a short, but difficult connecting line of 359 km. was finished between Estrada de Ferro Leste Brasileiro (Eastern railways of Brazil) and the Central do Brasil railroad at Monte Azul and Contendas. Northeastern Brazil was also connected with the south by railroad with the construction of a line linking Palmeira dos Índios and Colegio.

**Agriculture.**—The rice crop was sufficient to allow exports of 300,000,000 to 400,000,000 lb. The coffee harvest was estimated at 28,250,000 bags. The carnauba wax crop was estimated at 11,000 metric tons. The cotton crop totalled 1,355,000 bales. The cocoa crop was estimated at 355,000,000 lb. exceeding the previous record of 335,000,000 lb. produced in 1946-47. About 315,000,000 lb. of this crop went into the export trade. Wheat production amounted to 437,506 tons.

**Manufacturing.**—A Cr\$ 50,000,000 margarine factory, established in São Paulo by Anderson, Clayton and Co., Ltd., reached a daily output of about five metric tons. The Companhia Bahiana de Cimento Portland received a loan of U.S. \$2,070,000 from the Export-Import Bank of Washington for the installation of a 100,000-ton-per-year cement plant near Salvador.

Volta Redonda Steel plant reached an output of more than 300,000 metric tons of rolled steel during the year.

**Mineral Production.**—The first large-scale shipment of commercial manganese from Amapá territory to the United States took place during the year. In 1949 about 150,000 tons of Brazilian manganese were exported.

A plan to develop petroleum refining and distributing facilities was aided by the arrival of a new 16,500-ton oil tanker, the first of a large tanker fleet under construction in Europe and Japan. A refinery near Santos with a capacity of 45,000 l. a day was completed. Brazilian coal production reached 962,633 tons during the first six months of 1950 as compared with 2,128,858 tons in 1949.

**Bread and Bakery Products.** Estimates, which were based in part on the figures of the last U.S. census of manufactures, of important agricultural products used as ingredients by the baking industry of the United States in 1950 included approximately 12,500,000,000 lb. of flour, 1,200,000,000 lb. of lard and other shortening, 2,700,000,000 lb. of sugar and syrups, 300,000,000 lb. of eggs, 275,000,000 lb. of skim milk solids and 180,000,000 lb. of raisins. Accurate data on the amount of fruit utilized by the pie-baking segment of the industry were not available, but the quantity thus utilized was known to be large.

The value of the products produced by the U.S. baking industry during the year was estimated to be in excess of \$3,750,000,000. The baking industry ranked first among the food industries in the number of manufacturing establishments (about 30,000, if small retail shops, restaurants and institutions were included), its number of employees (about 316,000), and the size of its pay roll.

In Aug. 1950 the U.S. Federal Security administrator caused to be published the proposed definitions and standards of identity of bread and related products sold in interstate commerce, based on the record of public hearings held in accordance with the provisions of the Federal Food, Drug, and Cosmetic act. These proposals did not recognize as permissible optional ingredients of bread certain chemical compounds known as Spans, Tweens and

polyoxyethylene monostearate, widely used since 1947 by U.S. bakers as softeners in bread or as emulsifiers in cake. A finding of fact, proposed by the Food and Drug administration, stated in part: "Although there has been no definite evidence of injury from the use of Spans, Tweens, or polyoxyethylene monostearate in amounts in which they are likely to occur in the diet from their use in bread, the investigational work does not definitely establish their safety, and the record does not permit a conclusion that bread containing them is safe for continuous use over the human life span. Apart from their possible toxicity, the record as a whole will not support a finding that it would promote honesty and fair dealing in the interest of consumers to recognize sorbitan esters of fatty acids, polyoxyethylene sorbitan esters of fatty acids, and polyoxyethylene esters of fatty acids as optional ingredients of breads, rolls and buns."

Experimental data included in the lengthy record of the bread hearings showed that these softeners retarded the swelling and disintegration of starch granules in the making of dough and bread, and combined with the amylose fraction of the wheat starch. These properties were thought to be responsible for the unusual degree of softness of bread made with certain of the chemical emulsifiers. Some bakers testified that they were obliged to use softeners to meet competition in markets where wrapped bread may be selected by consumers on the basis of its feeling of softness. Evidence was obtained that the use of emulsifiers did not retard the rate of staling of bread containing them.

The subject of bread softeners and cake emulsifiers was discussed on the floor of the congress of the United States from the standpoint of the possible effects of these compounds on health and on the agricultural economy. It was charged that their use might involve a decrease in the use of shortening and eggs. Proponents of the emulsifiers and softeners claimed that the products actually used were harmless and involved no necessary decrease in the use of other ingredients of bakery products. At the close of the year 1950 the questions raised by the introduction of the emulsifiers were still being considered. (See also FLOUR.)

FILMS OF 1950.—*Breadmaking* (Paul Hoefer Productions). (F. C. Bc.)

**Brewing and Beer.** Beer and ale sales in the United States for the fiscal year ending June 30, 1950, totalled 84,202,618 bbl., the third highest fiscal year on record. Highest figure was 86,992,795 bbl. in 1948. Total sales by years since 1934 are given in the table.

Sales of Malt Beverages in the U.S.  
(Years ending June 30)

Year	Sales (bbl.)*	Year	Sales (bbl.)*
1935	42,228,831	1943	68,636,434
1936	48,759,840	1944	76,969,764
1937	55,391,960	1945	79,590,598
1938	53,926,018	1946	81,286,821
1939	51,816,874	1947	82,629,441
1940	53,014,230	1948	86,992,795
1941	52,799,181	1949	85,809,068
1942	60,856,219	1950	84,202,618

\*A U.S. barrel is 31 U.S. gal.

Bottled and canned beer accounted for 70.8% of the nation's total consumption, in contrast to a rate of about 25% in 1934 and prior years.

Early in 1950 results of a nation-wide consumer survey made in 1949 by Crossley, Inc., were published, which showed that 52.4% of the adult civilian population of the U.S. were consumers of beer and ale. This was about 1% higher than a similar survey showed in 1944.

Wisconsin led in the fiscal year both in production, 12,649,-

071 bbl., and sales, 11,548,841 bbl. New York was a close second in both categories and Pennsylvania third. The three states maintained the same order in 1949.

The brewing industry in 1950 enjoyed an abundance of raw materials—particularly malt, the basic ingredient, and corn, used as a malt adjunct.

During the year the United States Brewers foundation launched a safety program designed to afford maximum protection for workers in the industry. A contest sponsored by the foundation embraced the entire industry and set brewers in competition for maintaining the best safety records. Various educational media were used to enlist the workers' co-operation.

Another activity was the foundation's expansion of its Armed Forces Liaison program. Through this program, the industry co-operated with armed forces authorities in maintaining wholesome conditions surrounding the retail sale of beer in establishments serving military personnel. Beer was sold at nearly all post exchanges and, when obtainable, was issued to front-line U.S. troops in Korea.

**By-Products.**—Brewers' wet and dry grains, used extensively as high protein cattle feed, and brewers' yeast, richest known natural source of B vitamins, are important by-products of the brewing process. Since World War II, there had been an increasing use of brewers' yeast as a human nutrient and as a vitamin supplementary feed for poultry, livestock and domestic animals to provide a balanced ration.

Debittered yeast is used in bread and crackers and in the enrichment of noodles and dehydrated soup. Use of this yeast as a supplementary ingredient in bread, doughnuts and a limited number of other bakery items extends "shelf life" an additional 24 hr., it was reported in 1950 at the 10th annual Institute of Food Technology in Chicago. The report also stated that it accentuates the natural flavour of these foods. In addition to its use in baking products, brewers' yeast also is added in small quantities to candy, meat loaves, gravies, peanut butter, syrup and casseroles.

**Moderation and Enforcement.**—Close co-operation among brewers, wholesalers and retailers continued to be an integral part of the industry's self-regulation program which had its inception in 1938. This program, sponsored by the foundation whose members produce more than 80% of the beer and ale in the U.S., is an educational one, designed to impress upon industry members, particularly retail licensees, the importance of strict observance of all laws and of maintaining high standards of operation in the public interest.

**Industry Economics.**—The industry pay roll reached a peak in 1949, with weekly earnings for production workers averaging \$69.25, as compared with averages of \$53.57 for all foods and \$54.90 for all manufactures. These figures were expected to be exceeded in 1950.

Purchases of agricultural products were estimated at nearly \$300,000,000, mainly for malt, corn products, rice and hops. Purchases of cans, bottles, kegs, labels, transportation and various items of supplies, equipment, machinery and services were also important contributions to the national economy.

Federal excise taxes, at \$8 per barrel, and special taxes on malt beverages for the fiscal year 1950 totalled \$672,084,794, bringing the cumulative total since relegalization (April 7, 1933) to \$7,502,692,208. State and local taxes and licence fees in the fiscal year 1950 were estimated at \$215,000,000, raising the cumulative figure for that revenue to about \$2,515,000,000. Combined public revenues since 1933 thus had passed the \$10,000,000,000 mark. (See also LIQUORS, ALCOHOLIC.)

(E. V. LH.)

**Bridges.** The world's longest spans of the various types built up to 1951 are listed in the following table:

World's Longest Spans by Type of Bridge

Type	Bridge	Location	Year Completed	Span
Cable Suspension	Golden Gate	San Francisco	1937	4,200 ft.
Transporter Bridge	†Sky Ride	Chicago	1933	1,850
Cantilever	*Quebec	Canada	1917	1,800
Steel Arch	Kill van Kull	New York	1931	1,652
Eyebar Suspension	*Florianópolis	Brazil	1926	1,114
Concrete Arch	Sando	Sweden	1943	866
Continuous Truss	Dubuque	Mississippi river	1943	845
Simple Truss	*Metropolis	Ohio river	1917	720
Continuous Girder	Bonn-Beuel	Rhine river	1949	643
Vertical Lift	*Cape Cod Canal	Massachusetts	1935	544
Wichert Truss	Homestead	Pittsburgh	1937	533½
Swing Span	*Fort Madison	Mississippi river	1927	525
Tubular Girder	*Britannia	Menai straits	1850	460
Timber Span	*McKenzie River	Coburg, Ore.	1926	380
Bascule	*Sault Ste. Marie	Michigan	1914	336
Masonry Arch	Plauen	Saxony	1903	295
Single Leaf Bascule	*16th Street	Chicago	1919	260
Concrete Girder	Villeneuve	Seine river	1939	256

\*Railroad bridge.

†Not standing.

**United States.**—The new \$14,000,000 suspension bridge of 2,800-ft. main span over the Tacoma narrows west of Tacoma, Wash., was opened to traffic Oct. 14, 1950, to replace the slender \$6,400,000 structure that collapsed Nov. 7, 1940, as a result of aerodynamic oscillations during a 42-m.p.h. wind. The previous span had been in service only four months when the disaster occurred. The piers were salvaged from the original construction and altered to support the new structure, which was widened to four lanes and was provided with deep stiffening trusses and slotted roadways. The new 2,800-ft. span is the third longest in the world.

A 56-m.p.h. wind in June 1950 caused vertical oscillations of 42 in. in the deck of the 4,200-ft. span of the Golden Gate bridge at San Francisco, Calif. This was the largest amplitude oscillation recorded since motion-recording instruments were installed on the bridge in 1946.

Work on the plans for a new San Francisco Bay bridge, to cost \$128,291,000, was abandoned in 1950 upon failure to secure the necessary legislation from congress.

The Mackinac Bridge authority, established by the Michigan legislature in 1950, selected and engaged a board of three consulting engineers to prepare preliminary designs and estimates for a proposed bridge across the Straits of Mackinac to connect the Upper and Lower peninsulas of the state of Michigan. The water crossing is four miles wide, with maximum depth of 290 ft. The estimated cost was more than \$60,000,000, and the crossing would include a suspension bridge of about 3,800-ft. main span, which would be the world's second longest span.

Construction was speeded in 1950 on the \$40,000,000 Delaware River Memorial bridge near Wilmington, Del., scheduled to open by July 1, 1951. The project length of 3½ mi. included a suspension bridge of 2,150-ft. main span.

Construction progressed in 1950 on the \$44,000,000 Chesapeake Bay bridge, 21,286 ft. long, connecting the east and west shores of Maryland near Annapolis. The structure includes a suspension bridge of 1,600-ft. main span and a through cantilever bridge of 780-ft. main span, in addition to smaller deck cantilever spans and simple truss spans, all to carry a two-lane roadway, 28 ft. wide. The foundations for the deep-water piers presented the most difficult problem, requiring a novel pier design and using 17,500 tons of steel H-piles, half as much steel as in the four-mile-long superstructure.

A \$50,000,000 floating bridge of novel type was proposed in 1950 by the Washington State Toll Bridge authority for linking Seattle with the area to the west of Puget sound. The bridge, 14,600 ft. long, would be of constant level, unaffected by tidal action or driftwood. The deck would be supported above maximum tidal action by piers resting on submerged buoyancy chambers anchored by cables. Ships would pass through an inverted-lift

centre segment.

The \$27,000,000 Mystic River bridge, a two-level structure more than two miles long from Charlestown to Chelsea, Mass., was completed in 1950. The main span is a through cantilever.

A \$23,000,000 combination bridge and tunnel crossing of the Elizabeth river to connect Portsmouth and Norfolk, Va., via Berkley, was commenced in 1950 for completion in 1952. The four-lane bridge between Berkley and Norfolk was to be 2,135 ft. long, including a double-leaf bascule of 179-ft. span across the navigation channel.

The Penrose Avenue bridge at Philadelphia, Pa., with a cantilever main span over the Schuylkill river, was constructed in 1949-50 at a cost of \$12,000,000, to speed industrial traffic along the Delaware river below Philadelphia.

The new cantilever bridge over the Mississippi river at Memphis, Tenn., carrying four lanes of highway traffic, was completed in Dec. 1949. It took 4½ years to build and cost \$14,500,000.

Construction of the long-awaited bridge across Lower Tampa bay was finally authorized in 1950 by the Florida State Improvement commission. The toll bridge, to cost \$21,250,000, would cut 40 mi. from the road between St. Petersburg and Sarasota.

Construction was commenced in 1950 on the \$9,000,000 York River bridge at Yorktown, Va. It includes two 500-ft. equal-arm swing spans, set tandem.

The \$6,880,000 four-lane highway bridge over the Mississippi river at East St. Louis, Ill., was completed in 1950. The 964-ft. central cantilever span is the longest span over the Mississippi.

One of the biggest bridge-replacement jobs in the U.S. in 1950 was the construction of a modern railroad bridge over the Ohio river at Cairo, Ill., by the Illinois Central railroad at a cost of \$6,400,000 to replace a 60-year-old single-track bridge. Two 518-ft. and four 400-ft. Warren trusses replaced the old-style Whipple trusses of the same span length.

A bridge 7,000 ft. long was under construction in 1950-51 to carry the New Jersey turnpike across the Passaic river at Newark. The river span of 375 ft. is the longest plate girder span in the U.S.

A pedestrian bridge connecting Manhattan and Ward's Island over the Harlem river, constructed in 1950, includes a plate girder vertical lift span of 312 ft., the world's longest girder lift span.

A new highway bridge over the Mississippi river at Hastings, Minn., to be completed in 1951, was an arched continuous truss with three spans of 226, 514 and 226 ft. It replaced a 55-year-old bridge which acquired considerable fame for its unusual spiral approach.

The Arrowsic-Woolwich bridge across the Arrowsic river in Maine was completed in 1950. The 200-ft. suspended truss span was floated out on a barge and hoisted to position to close the gap in the cantilever span.

A vertical lift bridge of 335-ft. span completed during 1950 to carry the Southern railway over the Tombigbee river in Alabama replaced a 62-year-old 256-ft. swing span at the same site, with only two days' interruption of railroad traffic.

A new railroad bridge (built 1950) over the Blue river at Kansas City, Mo., is a continuous girder bridge with three spans of 64, 104 and 64 ft. In time of flood, the bridge can be lifted at the ends, raising it seven feet above its four intermediate supports. In the raised position, the structure is a simple beam spanning 232 ft.

The Bluestone River bridge near Hinton, W.Va., was completed in June 1950, following the erection failure in March 1949, when ten panels (232 ft.) of cantilevered trusses in span 3 collapsed without warning, killing five workmen. Following thorough investigations and tests, the failure went down in the annals of

HIGH-LEVEL CANTILEVER TOLL BRIDGE spanning the Mystic river between Chelsea and Charlestown, Mass., the largest bridge in New England at the time of its dedication on Feb. 25, 1950. More than two miles long from grade to grade, it has two three-lane decks each carrying one-way traffic

bridge construction as an unsolved mystery.

Awards made in 1950 for the most beautiful steel bridges completed in the U.S. during 1949 went to the North Main Street High Level bridge at Akron, O.; the Pinto Creek bridge near Superior, Ariz.; the Tenth Street bridge on a parkway at Atlanta, Ga.; and the Passaic River bascule bridge at Clifton, N.J.

**Italy.**—Design studies and estimates were prepared by U.S. engineers in 1950 for a proposed \$60,000,000 suspension bridge to carry railroad and highway over the Straits of Messina between Italy and Sicily. The crossing is two miles wide over water 400 ft. deep. With a main span of 5,000 ft., two side spans of 2,400 ft. and main pier foundations of record-breaking depth, the bridge would be the world's greatest span. The bridge was designed to resist railroad loading, aerodynamic action and earthquake forces.

The first Italian bridge made of prestressed concrete was completed in 1950 at Persiceto, to carry the Bologna-San Giovanni road over the Samoggia river. The span is 91 ft., and the width is 33 ft. The new method of construction saved 22% in concrete and 60% in steel.

**Puerto Rico.**—A new bridge to meet modern highway requirements over the Martin Pena channel at San Juan, P.R., was authorized in 1950 to replace the historic span known as "El Basculo." The new structure, to carry four lanes of modern highway traffic, was estimated to cost \$2,000,000.

**Chile.**—The longest bridge in Chile, a suspension bridge with a main span of 445 ft., was built in 1949 over the Imperial river in the southern part of the country. The towers are of concrete, 66 ft. high. This was the first of a series of five modern highway bridges in a government program for 1949-50.

A fixed-end arch of cellular reinforced concrete, with a span of 218 ft., was completed in 1950, high above a deep gorge of the Chirri river near Crucero in southern Chile. This new structure carries a single track for the heaviest equipment of the Chilean National railways. Timber falsework to support the forms was erected on timber trusses spanning from the gorge walls to a concrete construction tower, 133 ft. high, at midstream.

**Canada.**—Following three years of computation and experiment, the world's first arch bridge of aluminum was completed in 1950 over the Saguenay river at Arvida, Que. The arch span is 290 ft. The aluminum arch weighs only 200 tons, whereas a comparable arch of steel would weigh 400 tons. Erection of the light arch ribs by the cantilever method, using an overhead cableway, was completed in two weeks.

**England.**—During the erection (1950) of a Bailey bridge 1,150 ft. long over the Thames river at London, a 60-ft. section of the first span fell into the river while the span was being pushed out to meet the first of the six piers. The bridge was planned to carry traffic across the Thames during the Festival of Britain in 1951.

**Scotland.**—The world's first continuous truss bridge of aluminum was built in 1950 over the River Tummel in Scotland. The three-span bridge is 310½ ft. long, with a centre span of 172½ ft. Designed for a live load of 84 lb. per square foot on a seven-foot roadway, the bridge carries pedestrian traffic only.

**France.**—The world's first continuous bridge of prestressed concrete was completed late in 1949 at Neufchâtel-en-Bray. The bridge has three continuous spans of 59, 36 and 59 ft. The width is 45 ft., and the depth varies from 18½ in. at the abutments to 23½ in. over the centre span. Each span consists of 22 beams, precast separately and prestressed to carry their own weight before continuity was introduced through further prestressing by continuity cables after erection.

**SINGLE-SPAN BRIDGE** under construction near Leghorn, Italy, to replace one destroyed by naval bombardment during World War II. It was one of many postwar road projects sponsored by the Italian government in 1950

A double-deck masonry viaduct 895 ft. long and 109 ft. high, carrying railroad and highway over the Ain river at Cize-Bolozon in eastern France, largely destroyed in World War II, was entirely rebuilt by 16 men working for five years and was completed in 1950. The new structure is an exact replica of the historic viaduct, originally completed in 1875.

**Belgium.**—The world's second continuous bridge of prestressed concrete was completed in 1950 over the Meuse at Sclayn, Belg. It has two continuous spans of 206 ft. each.

**Germany.**—A new world's record of 643 ft. for the longest continuous plate girder span was established with the completion (late in 1949) of the Bonn-Beuel highway bridge over the Rhine in Germany. The girder is 1,293 ft. long, continuous over three spans of 295, 643 and 325 ft. The girder depth at mid-span is 9.8 ft., or 1/65 of the span. The bridge carries a roadway 40 ft. wide and two 10-ft. sidewalks.

The Frankenthal bridge carrying the *Autobahn* over the Rhine at Mannheim was finally completed in 1950. Continuous over two spans of 528 and 482 ft., it is the heaviest plate girder bridge in the world. Commenced in 1939, construction was interrupted in Dec. 1940 by the collapse of the 528-ft. span during erection, with the loss of 36 lives, when that record-breaking span was nearly completed. The failure was caused by an erection blunder. Investigation was halted and the story of the collapse was suppressed at that time by the Hitler government.

The Peace bridge, built in 1950 across the Main river at Frankfurt, is a continuous girder bridge, replacing the Wilhelms Brücke destroyed during the war.

The Saalach river *Autobahn* bridge near Munich, a reinforced concrete arch dynamited by the retreating Germans during World War II, was salvaged and rebuilt in 1950. The collapsed half-arches, with their shore ends pointing skyward, were raised to their former position by hydraulic pumps, and were then joined with new concrete to form the finished arch.

The world's longest prestressed-concrete span (353 ft.) was

completed in 1950. It was a three-hinged prestressed-concrete arch bridge (47.5 ft. wide) crossing the Neckar canal in the harbour of Heilbronn, Ger., and replaced a reinforced concrete arch bridge that was blown up by retreating German troops in 1945. Although the new bridge was seven feet wider than the old one, the total saving of steel was 40%, of concrete 16%, and of man-hours 15%, all credited to the adoption of the prestressed-concrete design.

**Egypt.**—The Egyptian State railways took bids in 1950 for the construction of a new rail and highway bridge of 250-ft. span over the Suez canal at Ismailia. The bridge, to cost \$1,500,000 and to be completed in 1952, would be of a movable type to allow navigation through the canal. When the new bridge was completed, the Ferdan bridge further north, which was built during World War II for the communication lines of the British army, would be demolished because it obstructs the navigation channel.

**Ethiopia.**—The biggest construction project in Ethiopia in recent times is the new bridge across the Blue Nile (Abbai river). Its length is 670 ft., with a main span of steel. It was built 1947–50 at a cost of \$1,000,000 to provide connection in time of floods between the two provinces of Shoa and Gojjam. (See also ROADS AND HIGHWAYS.) (D. B. S.)

**British Borneo.** British-administered territories in Borneo consist of the colonies of North Borneo (including the island of Labuan) and Sarawak, and the protected state of Brunei. Areas: North Borneo 29,417 sq.mi.; Sarawak c. 47,071 sq.mi.; Brunei 2,226 sq.mi. Pop. (1949 est.): North Borneo 335,000; Sarawak 560,000; Brunei 43,000. Governors, 1950: North Borneo, Sir Ralph Hone; Sarawak, Anthony F. Abell (also high commissioner for Brunei). British resident, Brunei: E. E. F. Pretty.

**History.**—In Sarawak 1950 opened with the appointment of a new governor; Anthony F. Abell succeeded Duncan Stewart, who was assassinated in Dec. 1949. For this crime two Malay youths were executed and nine others sentenced to imprisonment. All were members of a small secessionist society. Sir Ahmed Tajudin, sultan of Brunei, died at Singapore on June 3 and was succeeded by his brother, Oman Ali Saifudin.

In North Borneo the first legislative council was opened in Jesselton on Oct. 31. On the same date an executive council was established. Previously the territory had been administered by the governor with an advisory council. In Brunei, also, steps were taken in political development by the appointment of six representatives nominated by the divisional councils to the council *negri* (the legislature). Steps were also taken to unify the judiciary of North Borneo and Sarawak and to constitute a joint court of appeal.

Considerable progress was made in surveying and promoting the development of natural resources. In Brunei the output of oil continued to expand; it had reached more than 3,000,000 tons in 1949. Economic Cooperation administration funds (\$40,000) were made available to the Sarawak government for road development. In North Borneo the assessment of war damage claims was completed by September and payment of annual instalments of the awards started.

**Finance and Trade.**—Currency: Straits dollar, valued at 32.67 cents U.S., Oct. 16, 1950. Budget estimates, 1950 (in Straits dollars): North Borneo, revenue Str.\$15,720,094 and expenditure Str.\$20,673,206; Sarawak, revenue Str.\$17,152,624 and expenditure Str.\$19,493,795. Principal exports: rubber, sago, oil (Sarawak 3,302,880 long tons, 1949) and timber. Trade returns, 1949: North Borneo, imports Str.\$32,000,000 and exports Str.\$38,000,000; Sarawak, imports Str.\$110,000,000 and exports Str.\$188,000,000. (K. G. B.)

**British Columbia.** The crown colonies of Vancouver Island (1849) and British Columbia (1858), united in 1866 and on July 20, 1871, joined the Canadian con-

federation, the sixth province to do so. British Columbia is the third largest of the ten provinces and the most westerly, bordering on the Pacific ocean and lying between the 49th and 60th parallels. The province has an area of 366,255 sq.mi., of which 6,976 sq.mi. are water.

The population on June 1, 1950, was estimated to be 1,138,000 (1941 census, 817,861). At the time of the 1941 census almost 70% of British Columbia's population was of British origin. The 1941 census indicated 443,394 urban dwellers and 374,467 rural dwellers. More than 70% of the total population was located in the southwestern portion of the province not far from the United States border. The chief cities and their estimated populations were: Vancouver (385,500); Victoria, the capital (61,400); and New Westminster (34,500). It was estimated in 1950 that the population of Greater Vancouver was 527,721 (1941, 351,491), Greater Victoria 116,800 (1941, 75,218).

**History.**—In the first session of the 22nd parliament of British Columbia, Feb. 14, 1950, to March 30, 1950, the following measures were passed: An act to provide for a "dyking" commissioner and to provide for the maintenance of dykes throughout the province; an act to provide for the financing of a program of highway development and improvement in the province and providing power to borrow \$86,000,000 to finance such a program; an act authorizing the borrowing of \$16,500,000 to be used in a program of hospital construction within the province; an act providing for co-operation with the government of Canada and other public authorities in the provision of housing; an act to provide for the taxation of the railway belt lands of the Esquimalt and Nanaimo railway; an amendment to the Civil Service act allowing specialists to be paid higher salaries than those provided in the act; an amendment empowering the British Columbia Power commission to purchase assets of certain corporations; and an act authorizing an inquiry into the status and rights of Indians in the province.

A \$5,200,000 hospital construction program was announced for 1950 in addition to projects commenced during 1949. Construction was well advanced on the \$25,000,000 cellulose plant near Prince Rupert with production planned for early 1951.

On Oct. 2, 1950, Col. Clarence Wallace assumed the office of lieutenant governor succeeding Col. C. A. Banks, who resigned.

Members of the provincial executive council, or cabinet, and their portfolios at the close of 1950 were: B. I. Johnson, premier and president of the council; G. S. Wismer, attorney general; E. T. Kenney, lands and forests; H. Anscomb, finance; H. R. Bowman, agriculture; R. C. MacDonald, mines and municipal affairs; E. C. Carson, public works; L. H. Eyres, railways, trade and industry and fisheries; J. H. Cates, labour; W. T. Straith, education and provincial secretary; A. D. Turnbull, health and welfare.

**Education.**—During the school year ending June 30, 1949, 155,515 students were enrolled; in the elementary (99,356), elementary-senior-junior high (12,562), superior (2,366), junior, junior-senior and senior high (41,231) schools of the province. Teaching staffs comprised 5,496 teachers; in the elementary 3,157, elementary-senior-junior-high 444, superior 88, junior, junior-senior and senior high 1,748 and 59 unclassified. Higher education is provided by the University of British Columbia, a provincially endowed institution, two teacher training schools located in Vancouver and Victoria, a vocational institute at Vancouver and a junior college at Victoria.

The total net cost for the enrolment of 155,515 was \$33,377,852. The deputy minister and superintendent of education was F. T. Fairley.

**Communications.**—The total highway mileage as of March 31, 1949, excluding the Alaska highway, was 22,448, of which 9,971 mi. were surfaced, 9,928 mi. were improved earth and 2,549 mi. unimproved earth. Railway mileage as of Dec. 31, 1949, was 4,845 of main line track and 1,165 of sidings. During 1949 approximately 5,057,945 tons of cargo were loaded on vessels at British Columbia ports destined for foreign countries, while 2,302,938 tons of cargo received from foreign countries were unloaded from vessels at local ports. In 1948 the total number of telephones, 233,325, included 82,915 on automatic switchboards.

**Finance.**—On Feb. 25, 1950, Herbert Anscomb, minister of finance, reported that revenue collected for the fiscal year ended March 31, 1949, amounted to \$92,000,910; expenditures had been \$87,435,964; the net

debt at Dec. 31, 1949, was \$146,100,368, an increase of \$18,474,427 over Dec. 31, 1948. Anticipated revenues were \$105,831,190 and expenditures \$105,558,518 for the fiscal year 1950-51.

**Agriculture, Fisheries, Mining, Forestry.**—Preliminary provincial departmental estimates for 1950 indicated that the net value of production in forestry, fisheries and mining would show increases over 1949, with agriculture probably showing a decrease because of heavy frost damage to the fruit trees and other crops in the early months of 1950.

Table 1.—Economic Activity in British Columbia

	Unit	1948	1949	1950 Preliminary Estimates
<b>AGRICULTURE:</b>				
Total value of production	\$	144,225,000	139,960,500	131,000,000
Livestock . . . . .	\$	19,991,000*	19,708,000	20,500,000
Poultry products . . . . .	\$	20,118,000*	19,429,000	18,000,000
Dairy products . . . . .	\$	28,812,000*	30,707,000	31,000,000
Fruits and vegetables . . . . .	\$	34,750,000*	30,729,000	27,600,000
Field crops . . . . .	\$	33,293,000*	34,103,000	28,900,000
Miscellaneous . . . . .	\$	5,144,000*	5,284,500	5,000,000
<b>FISHERIES:</b>				
Total value of production	\$	58,703,803	56,456,260	62,000,000
Pack of canned salmon	cases	1,313,909	1,433,723	1,477,000
<b>FORESTRY:</b>				
Total value of production	\$	363,786,000	331,589,549	375,000,000
Timber scaled . . . . .	M.B.M.	4,293,465	4,049,682	4,250,000
Paper production . . . . .	ton	407,210	462,282	
<b>MINING:</b>				
Total value of production	\$	152,524,752	133,012,968	136,000,000
Lead . . . . .	\$	60,072,542	41,645,726	
Zinc . . . . .	\$	41,234,603	36,604,700	
Coal . . . . .	\$	10,854,108	12,462,424	
Gold . . . . .	\$	10,603,250	10,911,780	
<b>INTERNAL TRADE:</b>				
Index of wholesale sales	1935-39=100	333.8	333.1	347.0
Total value of retail sales	\$000	731,520	768,250	820,000
Value of retail department store sales . . . . .	\$000	102,378	109,910	114,000
Railway freight loaded	ton	10,325,427	10,394,769	10,600,000
Consumption of electric power . . . . .	000 kw.hr.	3,436,738	3,601,738	3,960,000
Construction, building permits . . . . .	\$000	96,953	89,293	86,000
Bank debits . . . . .	\$000	7,043,620	7,540,592	8,200,000
Index of employment . . . . .	1926=100	202.6	200.4	202.0
Salaries and wages paid	\$000	639,996	690,000	718,000

\*Subject to revision.

**Manufacturing.**—Preliminary statistics relating to the manufacturing industries indicated that the 1949 gross value of production would be moderately higher than the previous all-time high established during 1948. The high levels established during 1949 were well maintained during 1950.

Table II.—Principal Manufacturing Industries of British Columbia

Industry	Gross value of Products 1948	1947
Sawmills . . . . .	\$224,664,156	\$218,235,191
Pulp and paper . . . . .	75,474,342	61,346,715
Fish curing and packing . . . . .	56,309,747	56,618,563
Slaughtering and meat packing . . . . .	43,419,968	30,378,352
Petroleum products . . . . .	30,656,627	20,562,850
Veneer and plywood . . . . .	28,320,902	22,499,208
Shipbuilding and repairs . . . . .	27,173,975	28,489,231
Fertilizers . . . . .	26,119,263	23,441,939
Fruit and vegetable preparations . . . . .	24,244,004	26,424,577
Planing mills, sash and door factories . . . . .	23,496,534	13,485,753
Total all manufacturing industries . . . . .	985,592,702	858,284,592

## British East Africa.

The term is used to include Kenya, a colony and protectorate; Somaliland, protectorate; Tanganyika, under United Kingdom trusteeship; Uganda, protectorate; Zanzibar, protectorate, comprising the islands of Zanzibar and Pemba. Areas, populations and chief towns are in the accompanying table.

The East Africa high commission, comprising the governors of Kenya, Tanganyika and Uganda, administers the central serv-

ices and public utilities of these territories with a central legislature. Governors (Dec. 31, 1950): Kenya, Sir Philip Mitchell; Somaliland, Gerald Reece; Tanganyika, Sir Edward Twining;

	Area (sq.mi.)	Pop. (1949 est.)	Chief Towns
Kenya . . . . .	224,960	5,454,000	Nairobi (capital, 118,976), Mombasa (port, 91,893)
Somaliland . . . . .	67,936	700,000	Berbera (capital)
Tanganyika . . . . .	362,688	7,514,000	Dar-es-Salaam (capital, 69,277)
Uganda . . . . .	93,981	5,008,000	Entebbe
Zanzibar . . . . .	1,020	268,000	Zanzibar (capital, 45,275)

Uganda, Sir John Hall. Zanzibar: ruler, Sultan Seyyid Khalifa bin Harub; resident, Sir Vincent Glenday. East Africa high commission: chairman, Sir Philip Mitchell.

**History.**—Constitutional reform was the main issue in 1950 in Kenya, Tanganyika and Uganda, with European settlers showing anxiety lest, on common electoral rolls, their voice in affairs would be swamped by that of the Asians and Africans. In Uganda the numbers of official and unofficial members of the legislative council were made equal early in the year. Of the 16 unofficial members 4 were European (nominated), 4 Asian (nominated) and 8 African (elected by the provincial councils). In Tanganyika a select committee of the legislative council consisting of seven Europeans, four Africans and three Asians began a study of constitutional reforms. The Kenya Electors' union agitated against proposals that were submitted to the Tanganyika committee by the government. It was felt these constituted a threat to the political status of European settlers in East Africa.

The duke of Gloucester visited Nairobi to present, on behalf of King George VI, a royal charter which made Nairobi a city, the first in British East Africa. On July 7 the East African naval force was inaugurated at Mombasa. The jubilee of the Uganda agreement of 1900, the basis of British relations with the kingdom of Buganda, was celebrated on March 10. The occasion was marked by the raising of Makerere college to university college status and the approval for it of colonial development grants of more than £1,000,000 by the United Kingdom. In July the governor of Uganda issued a proclamation reaffirming that all land outside the towns was held in trust for Africans and that non-African settlement would not be encouraged. East Africa defense talks took place in Nairobi in October.

In Kenya, Indian and African leaders in April held a joint political meeting for the first time and in May a general strike of eight days was called in Nairobi after the arrest of the African president and the Indian secretary (a Communist) of the self-designated East African Trades Union congress. On April 24 a district officer, 2 European police officers, 1 African constable and 29 Suk tribesmen were killed in a clash with the tribesmen who were led by a wanted religious fanatic; this man was among the Suk killed. A rioter was killed in February during a dock strike at Dar-es-Salaam, in Tanganyika.

The threat of a serious locust invasion from the middle east, where infestation spread from Lake Chad to eastern India, caused the high commission to set up a locust control organization separate from its desert locust survey. An international conference at Nairobi in July laid plans for control measures to cost £1,000,000 a year for three years. Infestation in Somaliland necessitated a vigorous campaign of destruction which met with some objection from tribesmen. Failure of the rains in eastern Somaliland made famine relief measures necessary.

At Kongwa, Tanganyika, the peanut harvest of the United Kingdom Overseas Food corporation was deplorably meagre in spite of normal rains and in October it was decided that the cultivated area at Kongwa should be limited to 12,000 ac. instead of the 450,000 ac. planned. (See AGRICULTURE.) An Indian agricultural school was established at Morogoro and it was announced

that 300,000 ac. would be available for ranching at Essimangor. In Zanzibar, plans to attack the "sudden death" disease in clove plantations by large-scale felling, which was unpopular, were abandoned and the search for an alternative remedy and for possible alternative crops or industries was continued; experiments were conducted with cocoa and the possibilities of pineapple and fish canning were explored.

Development projects were: in Kenya, coal was found in the Kitui area, and the Colonial Development corporation was to develop the Macalden copper and gold mine on Lake Victoria; in Tanganyika, the survey of the rail link between Northern Rhodesia and Tanganyika was continued, the Colonial Development corporation granted rights over the southern coal fields, a meat-canning plant (50% government-owned) opened near Dar-es-Salaam and a 150-mi. tar-macadam road from Namango to Taveta begun; in Uganda, work on the Owen falls hydroelectric scheme continued and building of a £1,500,000 cement factory 20 mi. from the dam was begun; in Zanzibar, a copra crushing mill was being built by the government, and a £250,000 electricity scheme was approved.

**Finance and Trade.**—Currency: East African shilling, valued at 14 cents U.S. (20 East African shillings=£1 sterling); in Somaliland, the Indian rupee also circulated. Principal exports: Kenya—sisal, coffee, radium, hides and skins, tea and pyrethrum; Tanganyika—sisal, cotton, diamonds and coffee; Uganda—cotton, coffee, cigarettes and sugar; Somaliland—hides and skins, livestock, gums and ghee; Zanzibar—cloves and coconut oil.

	Revenue*	Expenditure*	Imports†	Exports†
Kenya . . . . .	£11,089,000‡	£10,984,000‡	£54,123,000	£29,174,000
Somaliland . . . .	£1,228,000§	£1,228,000§	£850,000	£583,000
Tanganyika . . . .	£11,647,000	£11,641,000	£27,576,000	£20,725,000
Uganda . . . . .	£7,706,000	£7,131,000	£12,818,000	£23,805,000
Zanzibar . . . . .	£966,000	£964,000	£2,750,000	£2,688,000

\*1950 estimates. †1949, exports includes re-exports.

‡Excluding development budget, rev. £4,799,708; exp. £6,162,129.

§1949-50 estimates, including grant-in-aid from United Kingdom of £832,134.

||Excluding development expenditure £377,368.

**BIBLIOGRAPHY.**—Negley Farson, *Last Chance in Africa* (London, 1950); G. W. B. Huntingford and C. R. V. Bell, *East African Background* (London, 1950).

**British Empire:** see COMMONWEALTH OF NATIONS.

**British Guiana.** A British colony on the northeast coast of the continent of South America. British Guiana has an area of 83,000 sq.mi. Pop. (1949 est.): 408,000. Chief towns (pop. 1948 est.): Georgetown (cap. 82,563); New Amsterdam (11,930). Governor in 1950: Sir Charles Woolley.

**History.**—It was announced in Jan. 1950 that the Colonial Development corporation would undertake the exploitation of 500 sq.mi. of forest in the Bartica triangle. Later, the corporation started the erection of a B.W.I. \$5,000,000 sawmill. In May, the two U.S. experts who had studied the mechanization of rice production in the colony reported that considerable expansion of the industry was possible. They believed that 368,000 ac. could be devoted to rice growing compared with the 77,000 ac. which were already being utilized for this purpose. In August Anaconda British Guiana Mines, Ltd., announced its intention to suspend its gold-mining exploration and development activities.

A revision of the colony's ten-year plan was made public in September. In submitting it to the governor, the economic adviser pointed out that of British Guiana's allocation of B.W.I. \$12,000,000 under the 1945 act, about B.W.I. \$9,000,000 had, in fact, been spent or committed so that only B.W.I. \$3,000,000 remained available for new schemes. In addition to this, however, British Guiana could count on drawing about B.W.I. \$3,000,000 from its accumulated general revenue surplus; and to this it was proposed to add B.W.I. \$10,000,000 by way of a new colony loan to be raised in 1951. Unfortunately, even this would not supply enough capital for proposed new or remaining schemes.

**Finance and Trade.**—Currency: British West Indian Dollar, valued at 4.8 to the pound; In 1950 the British West Indian dollar was valued at 58.33 cents U.S. Budget (1950 est.): revenue B.W.I. \$20,881,728; expenditure

B.W.I. \$20,491,606. Foreign trade (1948): imports \$50,927,886; exports B.W.I. \$46,246,564. Principal exports: sugar, rum, bauxite, rice, timber and diamonds.

(P. H.-My.)

**British Honduras.** A British colony in Central America, bounded by Mexico and Guatemala, British Honduras has an area of 8,598 sq.m. Pop. (1949 est.): 65,000. Chief towns (1946 pop.): Belize (cap., 21,886); Stann Creek (3,414). Governor in 1950: Sir Ronald Garvey.

**History.**—The year 1950 opened in an atmosphere of political excitement as a result of the devaluation of the British Honduras dollar on Dec. 31, 1949, to the rate of B.H. \$4 to the pound sterling. Previously, the local dollar had been at parity with the U.S. dollar and, alone among British colonial currencies, was so left when the pound sterling was devalued in Sept. 1949. Because of the traditional local dependence on United States sources of supply, the cost of living was bound to be adversely affected by the devaluation, but the United Kingdom made a special grant of B.H. \$450,000 for the year for subsidies to cushion the effects of devaluation, particularly for the poorer classes.

Devaluation, however, cleared the way for a greatly accelerated program of development. The Colonial Development corporation pressed ahead with a number of schemes such as the building of a hotel in Belize, the production of *lactatan* bananas, a ramie project and an animal husbandry scheme. A number of commercial investors, both British and U.S., embarked on schemes for the production of bananas, coconuts, tannic acid, pineapples and citrus. The timber industry enjoyed a qualified revival, and, in particular, there was an export market in the British Caribbean colonies for all dressed pine of reasonable quality that could be produced. In the chicle industry, United States buyers were again taking all first-grade gum that could be produced.

British Honduras was granted a sugar export quota of 25,000 tons a year by the United Kingdom government and plans were afoot for the development of sugar production to meet this quota. A preliminary sum of £50,000 was given to the colony by the United Kingdom government for this purpose.

There were no significant developments in the dispute with Guatemala over British Honduras.

**Finance and Trade.**—Currency: British Honduras dollar, valued in 1950 at 70 cents U.S. (B.H. \$4=£1 sterling.) Budget (1950 est.): revenue B.H. \$2,630,617; expenditure B.H. \$2,906,675. Foreign trade (1949): imports B.H. \$5,990,264; exports B.H. \$4,564,847. Principal exports: timber, chicle, grapefruit (fresh and juice).

**British Somaliland:** see BRITISH EAST AFRICA.

## British South African Protectorates.

The three territories in southern Africa which are not part of the Union of South Africa, Basutoland, Bechuanaland protectorate and the protectorate of Swaziland, are generally referred to as the High Commission Territories in South Africa.

	Area (sq. mi.)	Population		Capital
		(1946 census)	(1949 est.)	
Basutoland . . . . .	c. 11,716	562,311	556,000	Maseru
Bechuanaland . . . . .	c. 275,000	296,020	300,000	Mafeking
Swaziland . . . . .	6,705	185,208	194,000	Mbabane

High commissioner in 1950, Sir Evelyn Baring. Resident commissioners: (Basutoland) A. D. Forsyth Thomson; (Bechuanaland protectorate) A. Sillery; (Swaziland) E. B. Beetham.

**History.**—*Swaziland.*—An eight-year development plan for the territory framed in 1948 after an agro-economic survey was ap-

proved and colonial development funds to carry it out were made available. Conservation of the soil and measures to prevent erosion formed a notable part of the plan. Negotiations were completed whereby the Colonial Development corporation purchased about 100,000 ac. of afforestable grassland in the high veld catchment area of the Great Usutu river. This land was to be planted with suitable fast-growing conifers and in due time a large forestry industry would be established within the territory. For the first four years a sum of £1,177,000 was provided for the project.

Asbestos remained by far the most valuable export. In 1949 the ten-year-old Havelock mine exported a record total of 33,967 short tons of asbestos valued at £1,223,486. Nearly 20,000 head of slaughter stock valued at £258,069 were also exported.

The old advisory council of ten elected Europeans received statutory recognition and was reconstituted. The system of native administration was reformed, with the approval of the paramount chief.

**Bechuanaland.**—A disturbing event, which attracted much public attention within the territory and abroad, was the banishment of Seretse Khama, chieftain-elect of the large Bamangwato tribe numbering 100,000. An acute controversy arose after his marriage in London to Ruth Williams. Eventually the United Kingdom government decided to withhold recognition of Seretse as chief for a period of not less than five years, during which he would not be allowed to live within the protectorate without special permission. Later, in consequence of this decision, Seretse, his wife and their infant daughter returned to England. The former regent, Tshekedi Khama, was also prohibited from living in the Bamangwato tribal reserve but he remained in the protectorate. For the immediate future direct rule was introduced, but increasing responsibility was promised to a council of leading tribesmen.

**Basutoland.**—Progress was made in the campaign against soil erosion which had become a grave threat in this mountainous territory. Of the £830,000 allotted to Basutoland for its ten-year plan of development one-third was earmarked for agriculture, more specifically for soil conservation. In the densely populated lowlands approximately 227,000 ac. had been terraced by the end of 1948 and in the mountains 203,000 ac. had been protected by grass buffer strips; in addition about 260 earth dams had been constructed to seal off gullies. Grazing control was successfully

introduced and rigidly enforced by many of the tribal chiefs. Above 8,000 ft. the land was almost entirely given over to grazing for cattle, sheep and goats, the chief exports being wool and mohair. Because a considerable proportion of the cattle were of poor quality, attempts were made to persuade the people to reduce the number and improve the strain. There was the usual annual exodus of 50,000 migrant labourers to work in the gold mines of Witwatersrand.

(See also SOUTH AFRICA, UNION OF.)

(J. L.)

**British West Africa.** This term includes the following British territories on the west coast of Africa: Gambia, colony and protectorate; Gold Coast, colony and protectorate; Togoland, under United Kingdom trusteeship, administered with the Gold Coast; Nigeria, colony and protectorate; Cameroons under United Kingdom trusteeship, administered with Nigeria; Sierra Leone, colony and protectorate. Areas, populations and chief towns are in the accompanying table.

	Area (sq.mi.)	Population (1949 est.)	Chief towns
Gambia . . . .	4,074	254,000	Bathurst (cap., 21,152)
Gold Coast . . . .	78,802	3,739,000	Accra (cap., 135,926), Kumasi (78,483), Sekondi-Takoradi (44,557)
Togoland . . . .	13,041	388,000

Governors (Dec. 31, 1950): Gambia, P. W. Harris; Gold Coast, Sir Charles Arden-Clarke; Nigeria, Sir John Macpherson; Sierra Leone, Sir George Beresford Stooke.

**History.**—During 1950 constitutional development progressed in each of the territories.

**Gambia.**—Constitutional changes were announced in September. Membership of the legislative council would be increased from 13 to 15 by the addition of 1 official and 1 unofficial member, making 7 official members, 3 members elected for the colony area, 4 nominated on the recommendation of the divisional conferences in the protectorate and 1 other. A Gambian would be appointed vice-president of the council and after this appointment was made, the governor would begin to withdraw from active participation in the council.

**Gold Coast.**—A campaign for "dominion status now" was begun by the Convention People's party, led by Kwame Nkrumah, who announced on Jan. 8 that positive action, defined as "national non-violent sit-down-at-home strikes and boycotts" would begin immediately. A state of emergency was declared on Jan. 11 which lasted till March 18. Nkrumah and some of his supporters were jailed for offenses against the emergency regulations.

Preparations continued throughout the year for the new constitution which came into force on Jan. 1, 1951, and for the elections that were to be held in Jan. 1951. Of the 84 members of the legislative assembly 75 would be Africans and 8 ministers appointed from the assembly would almost certainly at all times be Africans. The ex officio ministers were to have charge of the portfolios of defense, external affairs, civil service, finance and justice. The governor, although he retained reserve powers which could be exercised in grave emergency, would be bound in normal circumstances to act on the advice of the executive council which would decide matters within itself by majority vote. To secure, however, that the public service was entirely free from political influence, the appointment, transfer, promotion, dismissal and disciplinary control of civil servants was vested in the governor acting in his discretion, and a public service commission was created.

In September legislation conferred the franchise on taxpayers over 21 years of age in the municipalities and in the rural areas which elected members of the electoral colleges; it also established the secrecy of the ballot in these primary and direct

LONE NATIVE ATTENDANTS at a meeting called in March 1950 by the high commissioner at Serowe, Bech., to discuss the result of the British government's decision regarding the position of hereditary chief Seretse Khama who had married a white woman

elections in the municipalities. At the end of December 663,069 persons, approximately 40% of the eligible population, had registered as electors.

In August a meeting of representatives of the joint provincial councils of the colony, the Ashanti Confederacy council and the newly created Southern Togoland council urged an endeavour so to work the new constitution during a trial period that full responsible government might be achieved.

**Togoland.**—The report of the first visiting mission of the United Nations was published in February. In June the British and French governments communicated to the United Nations a proposal to increase the membership of the commission to include, besides officials, 17 representatives (15 elected) from British Togoland and 28 (26 elected) from French Togoland. African representation up to then had been two members from each territory.

**Nigeria.**—Consultation on the proposed revision of the constitution continued throughout the year. In January a conference of the unofficial members of the legislature and 25 regional representatives met at Ibadan to consider proposals that had come from earlier provincial and regional conferences. These were accepted in the main by the Ibadan conference, which, however, recommended that Lagos, the capital, be a municipality apart from the regions and that the central legislature be enlarged. Both these recommendations were accepted in substance by the legislative council and the broad outline of the constitutional proposals that then emerged was: regional legislatures (with jurisdiction in such matters as local government, agriculture, education and public health) composed of, in two regions, a house of assembly and a house of chiefs, and in the third of a house of assembly alone; regional executives of a maximum of 5 official members and 9 members elected from the unofficial members of the legislatures; central legislature of a single chamber of 68 members elected by the northern regional legislature, 34 by each of the eastern and western regional legislatures, with 6 ex officio members and 6 nominated by the governor; council of state (central executive) of 6 official members and 12 elected by the unofficial members of the legislatures, of whom 9 would hold portfolios and 3 would be ministers without portfolio.

In February the Nigerian government bought for £1,000,000 the rights of the United Africa company in mineral royalties in northern Nigeria.

**Sierra Leone.**—The introduction of a new constitution, under discussion since 1948, was held up by the failure of the non-official members of the legislative council to agree on various issues, especially the relative representation of the colony (pop. 1947, 124,657) and the protectorate (pop. 1948, 1,733,618). The inhabitants of the colony, which includes the capital, Freetown, were for the most part descendants of liberated African slaves. The indigenous peoples of the protectorate had no natural links with them and had begun to produce an educated element which sought a larger voice in the conduct of Sierra Leone affairs, but the political leaders of the colony feared what they professed to regard as the probably reactionary influence of protectorate members, many of whom might be chiefs. In July the British government agreed that the scheme proposed in 1948 should be brought into force, with some modifications. This provided for an executive council of four ex officio members and four members nominated by the governor from the elected members of the legislative council.

The council was to consider later whether these unofficial members should hold portfolios. The new legislative council would have 7 official members, 12 elected from the protectorate, 7 elected from the colony, 2 nominated by the protectorate assembly and 2 appointed by the governor to represent trade and commerce.

**Finance and Trade.**—Currency: (West African) pound (£1=£1 sterling=280 cents U.S.).

	Revenue 1949	Expenditure 1949	Imports 1949	Exports 1949

**Budget, National.** **United States.**—The U.S. budget submitted to congress by President Harry S. Truman on Jan. 15, 1951, for the fiscal year 1952 recommended expenditures of \$71,594,000,000. These recommendations represented a substantial increase over the estimated expenditures for fiscal 1951 of \$47,210,000,000. On the basis of existing tax laws, it was expected that revenues in fiscal 1952 would total \$55,138,000,000 in contrast to the total of \$44,512,000,000 that was estimated for the fiscal year 1951.

Expenditures and revenues for the fiscal year 1952, as presented in the budget, would result in a deficit of almost \$16,456,000,000.

President Truman stated that he would recommend new tax legislation to congress which would at least balance the budget.

The substantial increase that was projected in the budget reflected the rising trend of the rearmament program that was undertaken after the outbreak of war in Korea. The president stated that it was "one measure of the vast new responsibilities thrust upon the American people by the Communist assaults upon freedom in Asia and the threats to freedom in other parts of the world." The need for rearmament had already caused a large rise in the budget for the fiscal year 1951 as compared with the recommendations originally made for that budget by Truman. Expenditures were almost \$5,000,000,000 higher and revenues more than \$7,000,000,000 higher than originally expected. The increase in expenditures was entirely for national defense purposes while the increase in revenues came largely from higher rates on the individual and corporation income taxes and from the enactment of a new excess-profits tax on corporations.

In summarizing the national objectives that were embodied in the budget for fiscal 1952 the president cited the following factors:

1. Expenditures for military purposes—to build swiftly an active force of highly trained men, equipped with the most modern weapons, and supported by ready reserves of men, supplies and equipment.

2. Expenditures to help other threatened nations rebuild their strength and to participate with them in a program of mutual aid and common defense.

3. Government programs for the expansion of productive capacity and the concentration of needed capacity on defense requirements—at the expense where necessary of normal civilian purposes.

4. Programs which would maintain and develop the national

strength over the long run, keeping in mind that the existing emergency might be of long duration and that the country must therefore be prepared for crises in the more distant as well as in the immediate future.

5. Reductions in other expenditures, in order to divert a maximum of resources to the overriding requirements of national security.

**Military Services.**—The bulk of the projected increase in the budget was for the purpose of providing expanded military services. Expenditures for fiscal 1952 for the department of defense were estimated at more than \$41,000,000,000, compared with actual expenditures in fiscal 1950 of \$12,303,000,000 and estimated outlays in fiscal 1951 of \$20,994,000,000. The rearmament program involved increasing the size of the armed forces to about 3,500,000 men from less than 1,500,000 men prior to the outbreak of war in Korea. In addition, plans included increasing the output of military equipment adequate for an even larger armed force. The president noted that expenditures for military research and development amounted to nearly \$1,000,000,000.

The other significant item included in military services was the stockpiling of strategic and critical materials. Outlays for this purpose were projected at \$1,300,000,000 in contrast to the actual outlays in fiscal 1950 of \$438,000,000.

Table 1.—Summary of Budget Receipts and Expenditures, United States  
Fiscal Years 1950 through 1952

Based on existing and proposed legislation

Description	Actual, 1950	Estimate, 1951	Estimate, 1952
<b>Budget receipts:</b>

Detail will not necessarily add to totals because of rounding.

\*Deduct, excess of repayments and collections over expenditures.

**International Security and Foreign Relations.**—The other increase of large magnitude in the projected budget was for the function of international security, consisting largely of military and economic assistance. Expenditures for this purpose were projected at \$7,461,000,000 compared with the outlays of approximately \$4,803,000,000 and \$4,726,000,000 in the two preceding fiscal years. This increase reflected the obligations that

CHART prepared by the U.S. bureau of the budget

were undertaken under the North Atlantic treaty, which provided for military assistance to the European nations that organized to strengthen the defense of Europe. Whereas the outlays in 1950 and 1951 were largely directed toward economic assistance, the program for fiscal 1952 would be primarily oriented toward military assistance. As part of the plan to strengthen the defenses of Europe, a supreme headquarters of the Allied powers in Europe was established under the command of Gen. Dwight D. Eisenhower and a unified European defense force was to be constituted.

In addition to the aid to be supplied in the west, the economic assistance program in Asia was to be expanded. The program included assistance to Indonesia, Indochina, Burma, Thailand, Formosa, the Philippines and Japan, and the president stated that both military and economic aid might have to be extended to additional Asiatic countries.

**Veterans' Services and Benefits.**—Changes in the remaining budgetary programs were all of smaller size than those for national defense and international aid. The largest decrease was that projected for the services and benefits to veterans. Outlays for 1952 were estimated at \$4,911,000,000 as compared with \$5,746,000,000 in 1951 and \$6,627,000,000 in 1950. This declining trend was the result of the continuing decline in requirements for the readjustment of veterans of World War II, rather than a reduction in the basic character of the services and benefits offered to veterans. The decrease from 1951 to 1952 was centred almost entirely in the education and training program and resulted from the reduced enrolment of veterans who were expected to be benefiting from this program in the 1952 fiscal year.

**Social Security, Welfare and Health.**—Although the coverage of the social security and public assistance programs had been substantially enlarged in 1950 to include about 10,000,000 additional persons, the president estimated that expenditures for all social security, welfare and health programs would increase by only \$105,000,000. This reflected the fact that the expenditures for the new obligations undertaken would be substantially offset by reductions in the assistance required because of enlarged employment opportunities.

**Agriculture and Agricultural Resources.**—A budget increase for this function was projected from a level of \$986,000,000 expended in fiscal 1951 to \$1,429,000,000 in fiscal 1952. This apparent increase resulted from the fact that the Commodity Credit corporation actually had substantial net receipts in 1951 from the sale of its accumulated holdings of agricultural commodities. It was expected that, because of the favourable outlook for agricultural prices and farm income, there would be little need for agricultural price supports in 1952. The change in the budget requirements for the stabilization of farm prices

was more adequately reflected by a comparison of the years 1950 and 1952, over which period a reduction in outlays of almost \$1,400,000,000 was anticipated.

**Natural Resources.**—Estimated expenditures in 1951 of \$2,117,000,000 were expected to increase in 1952 to \$2,519,000,000. The increase was largely explained by the expanded activities of the Atomic Energy commission which were to rise from \$818,000,000 to \$1,277,000,000.

**Transportation and Communication.**—The two significant changes under this heading were an increase in requirements for the merchant marine of \$164,000,000 that was to be more than offset by a reduction in the deficit of the postal service by almost \$500,000,000.

**Finance, Commerce and Industry.**—The proposed budget for the purpose of administrative and promotional activities in the areas of finance, commerce and industry represented an increase of \$1,156,000,000. This rise was entirely associated with requirements growing out of the expanded national defense program. It was accounted for by two important needs. The first was the necessity of providing for expanded production of both critical materials and armaments. The second was the need of providing adequate machinery for price and wage controls and for the allocation and control of production. In view of the magnitude of the rearmament program that was being projected, the president considered these regulatory activities to be essential in securing economic stability and the attainment of rearmament objectives.

**Housing and Community Development.**—The decrease shown for the programs under this heading arose because various housing agencies were expected to show surpluses on their activities for the fiscal year 1952. Partially offsetting these surpluses, how-

ever, were proposals for defense housing and for increased federal civil defense administration.

**Budget Receipts.**—Because of the new tax measures already enacted that would be fully operative in fiscal 1952, and as a result of the additional revenues that would be produced by the rising level of national income, government revenues were expected to increase almost \$11,000,000,000 in that fiscal year. The main sources of increase were the individual income tax and the corporation income and excess-profits taxes. Estimated revenues from the individual income tax of \$21,599,000,000 in 1951 were expected to rise to \$26,025,000,000 in 1952. The direct taxes on corporations, which yielded an estimated \$13,560,000,000 in 1951, were projected roughly at the level of \$20,000,000,000 in the fiscal year 1952. As already mentioned, the budgeted expenditures and receipts would result in a deficit of \$16,500,000,000, but it was apparent that additional tax legislation to substantially reduce or eliminate this deficit would be forthcoming. (See also DEBT, NATIONAL; INCOME AND PRODUCT, U.S.; TAXATION; UNITED STATES.)

**Great Britain.**—The 1950-51 budget of Great Britain, presented in April 1950, showed total receipts amounting to £3,898,000,000, as compared with £3,924,000,000 in fiscal year 1949-50. All the changes in revenue items were expected to be of small proportions.

Total budget expenditures were estimated to rise from £3,375,000,000 in fiscal 1949-50 to £3,455,000,000 in 1950-51. The increase was attributable to the provision of larger outlays for defense and social services.

A surplus of ordinary receipts over ordinary expenditures amounting to £443,000,000 was shown by the budget for 1950-51. In the preceding year there was a surplus of £549,000,000.

(M. Gr.)

**Building and Construction Industry.** Construction in the United States in 1950 achieved such proportions as to make meaningless all previously held concepts of a boom year. Dollar volume for building of all types reached a total of \$27,715,000,000, a gain of 22.7% over the 1949 record year, and home building soared to 1,395,600 new dwelling units which was 36% greater than the record-breaking 1,025,000 total of the preceding 12-month period. Employment in the construction industries likewise reached a new peak as did the production of many building materials.

Almost all divisions of the industry showed substantial increases over the previous year but the most spectacular gains were made in home building, which attained a volume of almost \$12,500,000,000 exclusive of farm construction and accounted for

\*Joint estimates of the Department of Labor and the Department of Commerce.

more than 40% of the year's total building.

Construction of private and public hospitals, schools, churches and other institutional buildings was at a new peak and expenditures for reclamation, flood control and highways were higher than in the preceding year.

The outbreak of hostilities in Korea at midyear modified the pattern of construction activity but not the pace. Liberal government-insured mortgage credit and extremely easy house purchase terms, particularly for veterans, had touched off the home-building boom the preceding summer. Both credit and terms were tightened in July and again in October to check inflation and conserve essential materials for defense needs. The check was slight and what minor effect it had in the remaining months of 1950 was more than offset by a marked upswing in industrial and commercial building, partially in response to the new rearmament program but more importantly in anticipation of government restrictions on construction of these types. Late in October the newly constituted National Production authority (*q.v.*) prohibited the building of theatres, race tracks, bowling alleys and a long list of other types of places of amusement and social gathering, unless specifically authorized by the NPA. The shadow that this order cast before it rather than the order itself disturbed the industry. It was generally expected that all types of commercial construction would be banned unless essential for the defense program, and that the credit restrictions already imposed on one- and two-family house construction would be extended to include apartment and multifamily house building.

Government expenditures for new construction amounted to \$7,067,000,000 and were almost 11% higher than the previous year, but they were much smaller than the private outlay, which totalled \$20,648,000,000 or 27.4% more than the comparable figure for 1949.

The physical volume of new construction was greater than the preceding year but reflected a steadily rising cost curve which began in the fall of 1949 and reached a peak in the fall of 1950 after which a slight levelling off was evident. According to the Boeckh index, based on costs in 20 representative cities, residential construction in June reached a new all-time high of 220.6 (1939=100), passing the previous peak of Oct. 1948 by 0.1%. The upswing continued through July and in August reached 228.3 to mark a new high point after which there was a slight recession

through October, the last month for which figures were available. The August figure represented a 10% increase over Aug. 1949.

The separate Boeckh index covering office building, hotel and apartment house construction passed the previous Oct. 1948 peak in May, a month earlier than the residential index. It continued to climb until September when it touched 208.0 and stayed there, up 8% from August of the preceding year.

Materials prices had moved up steadily throughout the year with the big jump coming in August following the start of the Korean war. The bureau of labour statistics building materials index for that month stood at 213.5 (1926=100), an increase of 3% over July, the

sharpest rise since Jan. 1947 following the removal of controls, establishing a new all-time high. September showed another increase of 2.6%, pegging the index at 219.6. The main cause of both boosts was a 5.5% jump in lumber prices in August and another of 3.7% in September, putting that essential material at a record index level of 371.0. In October lumber prices broke sharply, particularly for the cheaper grades, showing a general drop in the wholesale price of 3.3%, the first in 14 months. Together with a slight reduction in paint materials, its effect was to offset increases in brick, tile, plumbing and heating, and reduce the index for all materials fractionally to 219.0 for the first decline in a year.

Because of the unprecedented demand, the production of materials occasionally lagged behind for short periods but it was not until after the outbreak of the Korean war that a serious lack of certain components was reported. These were mostly in metals, including steel, iron, copper and lead in their various forms. Tight markets were reported turning gray in some instances as the industry anticipated some form of distribution control at a future date.

From the beginning of the year employment in the building trades was at seasonally record levels. The total for January, normally the low point in the annual building cycle, fell below the 2,000,000 mark for the first time since the preceding May but was still 86,000 higher than the previous January. Succeeding months continued to show gains and August set a record high of 2,588,900 workers employed by construction contractors. Although the total number employed dropped off from this peak in the following months it continued well above the comparable period of 1949 which likewise had been marked by a high contra-seasonal trend. November, with 2,537,000 workers employed, showed a drop of 3% from October but was 13% ahead of the same month in the previous year, setting another all-time record.

Wage rates, which during the preceding year had approached a stabilized level, resumed their upward march during 1950. Union pay scales had advanced 3% in 1949 as compared with a 10% increase in 1948. But in the first nine months of 1950 union wage scales advanced 5%. Surveying hourly rates in October for seven major building crafts in 85 cities, the bureau of labour statistics reported a rise of 1.6% since the beginning of July. Most of the increases were for 12.5 or 15 cents an hour but one in

every eight newly negotiated wage agreements called for an increase of 25 cents an hour. Plumbers and electricians made the greatest gains. Since June 1939, the bureau of labour statistics reported, union hourly scales had advanced approximately 81%. As of Oct. 2, 1950, it was estimated that the average hourly wage for all union workers in the construction industry was \$2.32 an hour.

Table II.—Estimated Increases in Union Wage Rates, and Rate Levels

Trade	Average amount of increase July 3, 1950 to Oct. 2, 1950 (Per cent) (Cents per hour)		Rate levels Oct. 2, 1950		
	Low	Average	High

Construction of government-subsidized public housing under the Housing act of 1949, which had been expected to contribute between 60,000 and 80,000 units to the year's volume of building, missed that mark by a very wide margin. As of Nov. 30, the Public Housing administration, the unit within the Housing and Home Finance agency having responsibility for the administration of the program, reported a total of somewhat more than 10,200 units being built under the 1949 act and 5,400 additional units under a previously authorized program. The slow start resulted first from congressional tardiness, following passage of the act, in making funds available, and second because of the lengthy procedures required both at the local and federal levels in getting projects to the construction stage.

By the time a substantial number of public housing projects were at the construction stage, rising costs were a serious problem. In some instances projects had to be temporarily postponed; in others the plans were redrawn to reduce cost and readvertised for bids.

That somewhat lower standards would set the public housing pattern under the federal program during the period of higher costs became evident in mid-October. To achieve greater economy in building the Public Housing administration at that time announced a revision of standards which reduced room sizes, increased the number of families to be provided for on a given land area and emphasized lighter construction.

Nor did the large-scale slum clearance and urban redevelopment program included in the Housing act of 1949 to assist localities to rebuild worn-out areas contribute to the year's tremendous volume of building. This program was expected ultimately to provide a substantial volume of work for the construction industry in the building of housing, commercial structures and public improvements. It was still largely in the preliminary planning stage although projects in Pittsburgh, Pa., and Chicago, Ill., were clearing sites in preparation for beginning building operations. As of Nov. 30, the Housing and Home Finance agency had received applications to participate in the program from 241 localities in 31 states, 3 territories and the District of Columbia. Preliminary planning grants amounting to \$172,000,000 had been approved on 228 of these applications and final planning advances totalling \$730,000 had been granted on 14 applications.

Most projects under the slum clearance and urban redevelopment program called for some commercial construction in addition to housing, plus a substantial amount of highway, street and other public improvements.

The industry was absorbed at the year's end with an effort to gauge the effect of the defense program in terms of construction needs as well as the effect of restrictive regulations already imposed and in prospect. A drop of 14% in total building volume to approximately \$23,000,000,000 was predicted for 1951 by

the *Magazine of Building*, with residential construction showing the biggest drop. Even so the building of new homes was expected to dip not much lower in dollar volume than the record-breaking total of 1949. In terms of the number of dwelling units started, this was expected to mean a total of between 800,000 and 850,000, the federal government's officially announced goal when the second set of restrictive regulations was issued in October.

Other private construction was expected to show a lesser decline from the record total of 1950. Industrial building, it was anticipated, would go above the 1950 rate in line with increasing war production needs and to take advantage of the revived wartime income tax ruling permitting accelerated depreciation for such facilities.

It was generally agreed, however, that availability of materials would prove the ultimate determining factor for all private building.

Government building was counted on to make up for some of the cutback in private construction. Military and naval expansion headed the list but it was expected that a substantial amount of new school building also would have to go ahead to take care of the postwar bumper crop of children, the first of whom would reach school age during the next year. Government-subsidized public housing was also scheduled for a substantial increase whether the program for low-income families was permitted to continue or was deflected to serve needs of workers in defense industry. Its success in keeping costs within the limits fixed by the Housing act of 1949 was expected to determine the size of the program.

(H. M. PR.)

**Great Britain.**—Against a background of international unrest and rising expenditure on armaments, hopes of an expansion of British building activity were lower in 1950 than at any other time since World War II. Construction of dwellings continued substantially at the same rate as in 1949, and there was some easing of the restrictions which governed the amount of building permitted to private enterprise in proportion to that undertaken by local authorities.

Material supplies were still not altogether satisfactory, a shortage of cement occasioning some anxiety in the early summer.

Official planning, moreover, appeared not to have considered sufficiently that the total volume of building which could be completed in a year was uncertain insofar as it would be affected by the weather. This served to indicate the narrowness of the margin surrounding the activities of the industry; and when the Conservative party conference recommended a 50% increase in the housing target, it was felt by many that such a project might have little hope of achievement.

Recruitment to the skilled trades, particularly to the trowel trades, bricklaying and plastering, was most unsatisfactory. A study of the industry led to the estimate that the total apprenticeship force should number about 22½% of the skilled labour force. However, a census carried out by the ministry of works during 1949 showed that the proportion of young employees in the skilled trades was less than 14%; and in the north of England, where figures were generally above the average, it nevertheless appeared that employers were refusing to accept responsibility either for comprehensive training or for continuity of employment. Nor was it only the disinclination of employers that was responsible for low recruitment figures, for in spite of many efforts to publicize the advantages of apprenticeship in building and the opportunities which it offered, it found little favour with boys in general or with their parents (a disability which it shared with other manual occupations). All sections of the industry continued, however, to show great interest in tech-

nical education, and the number of students taking organized courses of one sort or another was probably greater than ever before.

In the field of research and development, the Building Research station took over the chief scientific adviser's division of the ministry of works. This brought to an end what many had long regarded as an anomaly, namely two official research bodies dealing with overlapping problems. The Building Research station continued to wrestle with the problem of communicating its findings to the industry, apparently with increasing success.

During the postwar period a number of the larger contracting firms had organized testing and research units, usually concerned with a well-defined section of work, such as foundations. By 1950 at least one firm had a laboratory investigating a considerable range of constructional problems and making a valuable contribution to the total volume of such work. In spite of day-to-day difficulties, expenditure on building formed the greatest part of the capital investment of Great Britain.

The year 1950 saw the publication of (1) the report of the working party set up by the ministry of works in 1948, (2) the report of the Anglo-American Productivity team which had been in the U.S. in 1949, and (3) the recommendations for nationalization prepared by the executive committee of the National Union of Building Trades Operatives.

(D. A. G. R.)

**Bulgaria** A people's republic in the eastern part of the Balkan peninsula, Bulgaria is bounded north by Rumania, west by Yugoslavia, south by Greece and east by Turkey and the Black sea. Area (including southern Dobruja): 42,796 sq.mi. Pop. (mid-1949 est.): 7,160,000. Languages (1947 est.): Bulgarian 88%, Turkish 9.8%. Religions (1947 est.): Greek Orthodox 84%, Moslem 11.5%. Chief towns (pop., 1947 est.): Sofia (cap., 434,888); Plovdiv (125,440); Varna (77,792); Russe (53,420). Chairmen of the praesidium of the national assembly in 1950: Mincho Neychev and, from May 27, Gen. Georgi Damianov; prime ministers in 1950: Vasil Kolarov and, from Feb. 1, Vulko Chervenkov (*q.v.*).

**History.**—Prime Minister Vasil Kolarov died on Jan. 23, 1950. He was succeeded by Vulko Chervenkov who had spent most of the period between World Wars I and II in exile in Moscow. Chervenkov thus combined in his person the offices of prime minister and general secretary of the Communist party, a situation otherwise enjoyed only by Stalin and Tito.

The new premier began his rule by a purge in the Communist party. Dobri Terpeshev, who had spent 14 years in prison in Bulgaria under the pre-World War II regime and had taken part in the resistance movement during the war, was removed from the party's central committee and from the secretaryship of the Communist-led "mass people's organization," the Fatherland front. In a speech on Jan. 16, Chervenkov blamed Terpeshev for tolerating the sabotage of the "Kostovites" in the economic field when he held the office of chairman of the Planning commission and for failing to inform the party's central committee of the "anti-soviet attitude" of Traicho Kostov, who had been hanged for treason and other crimes in Dec. 1949. Chervenkov also blamed Anton Yugov, minister of the interior and a leader of wartime resistance, for not preventing foreign spies from infiltrating into the security police. In the government reshuffle, Terpeshev was relegated to the ministry of social welfare, Yugov to that of industry. Their disgrace marked another stage in the victory of the Muscovite exiles over the home-front resisters in the leadership of the party.

At a conference of the Communist party held in May, it was announced that the party had 430,000 members. Its social composition was regarded as unsatisfactory. Peasants formed 44% of the membership, and one-fourth of these were members of collec-

tive farms; workers formed only 25.8%, whereas two years previously they had formed 26.5%, while civil servants had increased their proportion during the same period from 16.3% to 17.8%. Nearly 30% of all civil servants in the country were party members, whereas only 19% of all workers had joined the party. Among the sins of the party "unmasked" at the conference were insufficient vigilance toward "Kostovites," too frequent expulsions of party members for frivolous reasons and the tendency too easily to accept false accusations against members. Soon after the conference a further cabinet reshuffle took place. The minister of defense, Georgi Damianov, was transferred to the decorative post of chairman of the praesidium of the national assembly and was succeeded by his deputy, Lieut. Gen. Petr P. Panchevsky.

The collectivization of agriculture made considerable progress during 1950. On Jan. 1 there were 1,605 collective farms, with 161,000 members and controlling an area of 560,000 ha. On Sept. 9, 1950, according to a speech by vice-premier Vladimir Poptomov, there were 2,375 with an area of 1,847,113 ha. Collective farms now possessed 11% of the arable land in Bulgaria and produced 20% of the country's agricultural output. This result exceeded the target given in a government statement of Jan. 29, which had aimed at 800,000 ha. for collective farms by the end of 1950.

How it was achieved was somewhat of a mystery. In March the assistant minister of agriculture and the head of the collective farms department of the ministry had been dismissed, and the minister himself reprimanded, for giving instructions for the creation of collective farms. The instructions themselves had been revoked. Chervenkov himself had declared in a speech of April 5 that the process must be entirely voluntary, that results must be obtained not by compulsion but by example and persuasion. Despite this apparent relaxation of pressure the pace was double that originally intended.

In the cultural field, book production followed the lines desired by the party leaders. Since 1945, it was announced, 13,700,000 copies of books had been produced in Bulgaria, of which the works of Georgi Dimitrov, Stalin and Lenin accounted for

**BURNING THE FLAG** at the U.S. ministry in Sofia after the U.S. formally broke diplomatic relations with Bulgaria in Feb. 1950. The photo was brought to Paris by a U.S. press attaché of the former ministry

more than 2,500,000.

In the artistic field, however, progress was less satisfactory. In April the Academy of Art was reorganized with the avowed aim of eliminating bourgeois teaching and to make clear that "not only ideological education but also creative development of young artists depends on the quality of teaching of Marxism-Leninism." The reorganization did not at once achieve its aim. A prominent Bulgarian painter, Alexander Ghendov, presumed to write a letter to Chervenkov complaining of the way in which official artistic policy was being executed and, indeed, of the policy itself. Chervenkov replied by a speech to the Painters' union on May 26. Ghendov was denounced as the spokesman of the "bourgeois individualistic revolt against the spirit and the leading role of the party in figurative art, and against the party's struggle to overcome the rotten and demoralized culture of western Europe." A campaign against the new sin of Ghendovism then followed in the Bulgarian press. It pointed out that the best painters today followed soviet fine arts, seeking inspiration from "the masterpieces of Surikov and Repin, masters of classical Russian painting, and from the best examples of pictorial art in the world." Ghendov's crime was explained when it was learned that he had studied painting in Berlin and Moscow under artists who had subsequently been unmasked as enemies of the Soviet Union.

The United States broke off diplomatic relations with Bulgaria on Feb. 20, after the Bulgarian government had demanded the recall of the U.S. minister on the ground that he had been implicated in the Kostov trial. Bulgarian relations with Yugoslavia continued to be almost as bad as possible. A dispute with Turkey became serious in the summer when the Bulgarian government decided to expel to Turkey 250,000 members of the Turkish minority in Bulgaria. The Turkish government stated that it could not possibly find room for such large numbers on sudden notice. It also suspected that among the expelled there would be Communist agents and spies. The Bulgarian government dumped numbers of unfortunate people on the Thracian border. (See also YUGOSLAVIA.) (H. S.-W.)

**Education.**—Schools (1949-50): kindergarten (including part-time schools) 1,403, pupils 57,487, teachers 2,124; primary 6,112, pupils 7,556,280, teachers 18,801; elementary 2,960, pupils 308,160, teachers 12,636; secondary 218, pupils 112,633, teachers 4,624; technical 101, pupils 26,800, teachers 943; universities and institutions of higher education (1947-48) 9, students 49,800, professors and lecturers 1,283. Illiteracy (1946) 23%.

**Finance and Banking.**—Budget: (1949 est.) balanced at 152,614,000,000 leva; (1950 est.) revenue 207,252,000,000 leva, expenditure 198,018,000,000 leva. National debt (March 31, 1947) 68,896,000,000 leva. Currency circulation (March 1947) 35,000,000,000 leva. Savings deposits (Dec. 1947) 17,996,000,000 leva. Monetary unit: lev (pl. leva) with an official exchange rate of 290 leva to the U.S. dollar.

**Foreign Trade.**—(1948) Imports 35,119,000,000 leva; exports 34,114,000,000 leva. Main sources of imports: U.S.S.R. 58%; Czechoslovakia 12%. Main destinations of exports: U.S.S.R. 52%; Czechoslovakia 11%. Main imports: metals, machinery and textiles. Main exports: tobacco and tobacco products.

**Transport and Communications.**—Roads (1945): 13,870 mi. Licensed motor vehicles (Dec. 1949): cars 6,000; commercial 5,000. Railways (1949): 1,996 mi. Telephones (1948): 54,347. Radio receiving sets (1949): 205,000.

**Agriculture.**—Main crops (metric tons, 1948): wheat 1,502,000; rye (1947) 196,000; barley 249,000; oats 105,000; maize 890,000; sugar, raw (1949) 54,000. Livestock (1948): cattle 1,918,000; horses and mules 449,000; sheep and goats 8,995,000; pigs 957,000; poultry (1947) 10,329,000.

**Industry.**—Fuel and power: coal (1947) 4,111,000 metric tons, (1948 est.) 3,933,000 metric tons; electricity (1947) 480,000,000 kw.hr., (1948 est.) 553,000,000 kw.hr.

**Bunche, Ralph Johnson** (1904- ), U.S. political scientist, was born on Aug. 7 in Detroit, Mich. He was graduated from the University of California at Los Angeles, Calif., in 1927, received a master's degree in government from Harvard university in 1928 and a Ph.D. in 1934. He taught political science at Howard university, Washington, D.C., becoming a full professor in 1938. Meantime,

he travelled through French West Africa on a Rosenwald field fellowship, studying and comparing the administration of French Togoland, a mandated area, and Dahomey, a colony. He later did postdoctoral work at Northwestern university, Evanston, Ill., and at the London School of Economics in 1936 and 1937, before returning to Africa for further studies of colonial policy. During World War II he served with the joint chiefs of staff, the Office of Strategic Services and the U.S. state department, then joined the United Nations secretariat as director of the division of trusteeship in 1946. He was assisting Count Folke Bernadotte of Sweden in mediating the Jewish-Arab warfare in Palestine when Bernadotte was assassinated in 1948. Afterward Bunche supervised the truce and armistice agreements there. For this and for his other efforts in behalf of the U.N., Bunche was awarded the Nobel peace prize for 1950, the first Negro to win the award, which amounted to \$31,410. In October Harvard university announced that Bunche had been appointed professor of government at that institution.

**Burma.** An independent federal republic, Burma lies on the eastern side of the Bay of Bengal, between Pakistan and India on the northwest, Tibet on the north and China, Indochina and Thailand (Siam) on the east. The republic comprises Burma proper, the Shan state, the Kachin state, the Chin special division and, if constituted, the Karen state. Area: 261,749 sq.mi. Pop. (1949 est.) 18,200,000. Racially, the peoples of Burma are Mongoloid. About 90% are Buddhist by religion, and about 70% use the Burmese language. Chief towns: Rangoon, capital and main port (pop. 1941, 501,291); Mandalay (pop. 1941, 163,537); Moulmein (pop. 1931, 65,506); Bassein (pop. 1941, c. 50,000) and Akyab (pop. 1931, 38,094).

President of the republic: Sao Shwe Thaik; prime minister: Thakin Nu.

**History.**—During the year 1950 steady progress was made by the government's forces in reducing the several types of rebels who were in the field. Advancing northward along the Sittang valley, the government troops took Pyuntaza on Feb. 25 and Kyauktaga the following day, and on March 19 Toungoo, capital of the Karen "government," also fell. The loss of Toungoo was a severe blow to the Karen cause, and though resistance continued, by the end of the year it was confined to little more than two detached areas, the hilly district of Papun by the Salween river and the more inaccessible parts of the Irrawaddy delta. The Karens suffered also the loss of their leader, Saw Ba U Gyi, who was killed on Aug. 12. Despite these serious defeats, there were still at the end of the year several thousand Karens in the field, armed, trained and disciplined, and apparently determined to carry on their resistance until their demand for an autonomous Karen state should be conceded. By the end of the year there were no signs of any progress toward a political settlement, except that the Regional Autonomy commission had been revived.

After the capture of Toungoo, the government forces turned much of their attention to the left-wing rebels. A drive northward up the Irrawaddy valley led to the capture on May 19 of Prome, the headquarters of the so-called Democratic Front. This organization was already seriously weakened by differences of opinion and personal rivalries between the Communists and the People's Volunteer organization who were its principal components, and it was rumoured that the two factions had come to actual warfare with one another in March. Later, at the end of the rainy season, the government forces resumed their operations and on Oct. 13 took the important river town of Thayetmyo.

The result of these various operations was that the principal routes between Rangoon and upper Burma were reopened to use after more than a year's interruption. The main railway and the trunk road from Rangoon to Mandalay through Toungoo, and the

Irrawaddy river from Rangoon to Mandalay by way of Prome and Thayetmyo, were once more accessible to lawful traffic, though they were still at the end of the year liable to sporadic attack. On the other hand, though the government held nearly every important town and the principal routes, the administration had little control a short distance away from the towns and routes, and in many districts law and order hardly existed.

In the political sphere, the principal event was the expulsion from the government party—the Anti-Fascist People's Freedom league—of the two leaders of the Trade Union congress (Burma) and the suspension, for a month, of the congress's affiliation to the league. The leaders of the congress had long displayed strong leftist sympathies and had earlier in the year sought affiliation to the Communist-controlled World Federation of Trade Unions. On Sept. 5 Thakin Hla Kyway, in a speech in the legislature professing to support the government's approval of United Nations action in Korea, in fact opposed it. On Sept. 21, therefore, he was expelled from the league.

Burma's relations with the United Kingdom remained cordial. On March 7 the offer was made, and shortly afterward accepted, of a loan of £6,000,000 to Burma from British Commonwealth sources; of this the United Kingdom provided £3,750,000, India £1,000,000, Pakistan and Australia £500,000 each and Ceylon £250,000. The position of British commercial interests was, however, not happy. In the more disturbed districts, notably Tavoy, Communist activities brought British-owned enterprises, such as tin mines, to a standstill. The oil companies also met difficulties. Early in 1949 the British government, anxious to facilitate the economic recovery of Burma, guaranteed the companies against losses incurred in restoring the installations destroyed in 1942. On Jan. 8 the guarantee was terminated, since there appeared to be no prospect of a speedy return to peaceful conditions in which the concerns could operate profitably. The companies therefore dismissed about 2,500 workers. These appealed to the Industrial Court of Arbitration which declared the dismissals illegal and in general attempted to prescribe the policy which the companies must follow. The matter was taken to the supreme court which in October gave a partial reversal of the industrial court's decision, especially in regard to the attempt to dictate policy.

In October an economic co-operation agreement was entered into between Burma and the United States, under which Burma was to receive aid to the extent of \$8,000,000–\$10,000,000 in the year ending June 30, 1951; a special technical and economic mission was to be established in Rangoon to advise the Burmese government. The U.S. government also made a gift of ten landing craft to the government for the use of the Burma navy.

Relations with China presented some slight problems. Early in the year remnants of Kuomintang forces, fleeing before the victorious Chinese Communists, crossed the border from Yunnan and sought refuge in the Burma Shan state of Kengtung. They maintained themselves there as organized units, still possessing their arms, and it was suspected that they were planning an attack on Yunnan. The situation was liable to cause strained relations with China, and in July the Burmese government took strong measures to deal with the problem. Burmese forces attacked the Chinese positions, and some hundreds of men who were captured were sent to internment camps in Meiktila and Mandalay. But though the remainder were dispersed from their main concentrations near the Burmese-Thai border, they remained in the field, preying on the countryside. (B. R. P.)

**Education.**—State and private primary schools (March 1948) 4,795, pupils 431,684, teachers 11,315; secondary schools (1947–48) 142, pupils 11,648, teachers 722. Rangoon university (1949): students 2,960 (including 640 women).

**Finance and Banking.**—Budget: (1949) revenue Rs. 430,300,000, expenditure Rs. 528,000,000; (1950 est.) revenue 483,600,000, expenditure 532,200,000. Monetary unit: rupee with an exchange rate (Nov. 1950) of Rs. 4.775 to the U.S. dollar.

**Foreign Trade.**—Imports (1949): Rs. 373,000,000; exports (1949) Rs. 733,000,000. Main sources of imports (1948–49): India 31.6%, United Kingdom 28.2%, China 8.61%. Main destinations of exports (1948–49): India 37.8%, Ceylon 19.0%, British possessions and Malaya 13.3%. Main imports (1948–49): textiles 36%, food products 13%, machinery appliances and vehicles 11%. Main exports: rice 82%, metals and ores 3%.

**Transport and Communications.**—Roads (1949) 12,472 mi. Licensed motor vehicles (Dec. 1949): cars 5,000; commercial 24,000. Railways: (1948) 1,786 mi.; passenger-mi. (1949) 74,000,000; net freight ton-mi. (1949) 113,000,000.

**Agriculture and Fisheries.**—Main crops (metric tons 1949): rice 4,076,000; peanuts 130,000; cottonseed 14,000; ginned cotton 8,000; sesame seed 32,900; dry beans 45,000; tobacco (1949–50) 29,000. Livestock (1948): cattle 5,207,000; sheep 21,000; goats 172,000; pigs 394,000; horses 12,000; buffaloes 721,000. Fisheries: total catch estimated at 500,000 tons annually.

**Industry.**—Factories (1947) 473; persons employed 46,480. Raw materials: silver (fine ounces, 1948) 450,000; tin concentrates (metric tons, 1948) 1,773,000; natural rubber (net exports, 1948) 9,240,000; timber, teak (1948–49 rafting season) 68,938 logs.

**Buses:** see AUTOMOBILE INDUSTRY; ELECTRIC TRANSPORTATION; MOTOR TRANSPORTATION.

**Business Review.** The year 1950 in the United States was characterized by expansion and an upward trend in all sectors of the economy following the downward adjustment throughout most of 1949 from the high level reached in 1948. The upturn in business activity, employment and production which began during the fourth quarter of 1949 progressed steadily, with only minor interruptions, throughout the first half of the year and was greatly accelerated during the last half of the year following the outbreak of war in Korea. When South Korea was invaded late in June, production and employment in the United States were close to peacetime record levels, credit had been expanding and prices had been rising for some weeks. Because of this high level of activity, the impact of the prospect of a new defense program was greater in magnitude and earlier in timing than was suggested by the addition of some \$10,000,000,000 of defense expenditures to the federal budget during 1951, with more to be added later.

A more immediate and much greater impact arose from the rapid increase in expenditures of businesses and consumers in anticipation of shortages in civilian goods and of increases in prices. Prior to the Korean war, inflationary pressures had already gained substantial momentum as the result of expanded peacetime consumer and business buying. This expansion in buying was based primarily on the high level of income, but it was financed also, to a large extent, by a substantial expansion of credit and by an increased use of the very large supply of currency and bank deposits. Following the government announcement of a larger military program, the tempo of private spending was accelerated greatly, credit demand increased substantially and commodity prices rose sharply.

In recognition of the inflationary situation, Pres. Harry S. Truman initiated the first steps to curb it. On July 18, he directed the federal agencies concerned with real estate credit operations to tighten the terms on which federally aided credit was available. In his midyear report to congress on the economic state of the nation, dated July 26, he requested congress to authorize emergency powers to limit the use of essential materials; to regulate consumer, real estate and commodity trading credit; and to assure adequate financing for defense production and production facilities. The day before, he presented to congress a tax program to increase federal revenues by approximately \$5,000,000,000.

The treasury raised the limits for purchases of series F and G savings bonds by certain classes of institutional investors and banks to be effective during specified periods in the early part of Oct., Nov. and Dec. 1950, and a new campaign was inaugurated to promote sales of series E bonds, especially through pay-roll savings plans. These efforts were directed toward ab-

sorbing funds that might otherwise be available for civilian spending.

On Aug. 18, 1950, the federal reserve board of governors and the federal open market committee agreed upon three steps to place curbs on over-all inflationary credit expansion:

(1) Discount rates were raised from 1.5% to 1.75% at all federal reserve banks to discourage borrowing by member banks of additional reserves to support further credit expansion.

(2) Open market operations were directed toward discouraging sales to the federal reserve of short-term United States government securities, including sales by banks to obtain funds for extending other types of credit.

(3) Early in August the board of governors joined with other federal and state bank supervisory agencies, including the Home Loan Bank board, in a statement requesting the voluntary co-operation of banks and other lenders in restricting their lending and investment activities.

Signed on Sept. 8, 1950, the Defense Production Act of 1950 authorized the president to exercise certain controls over credit, production and distribution of materials. It also conferred stand-by powers upon the president to fix ceilings on wages and prices and to ration consumer goods when he felt such steps were justified. Defense spending was to be doubled to an annual rate of \$30,000,000,000.

Under the Defense Production act, an independent economic stabilization agency was created on Sept. 9, with W. Stuart Symington as defense co-ordinator to administer all controls, defense production expansion and economic mobilization. On the same day, President Truman ordered all persons engaging in trade or business during the period May 24–June 24, 1950, to keep records of cost and price data—the base period upon which wage and price ceilings would be determined when and if necessary.

The board of governors of the federal reserve bank announced on Sept. 8 that credit restrictions under regulation W would become effective ten days later. As the first step, the board ordered down payment of at least one-third on automobiles with no more than 21 months to pay, and of 15% on home appliances with 18 months to pay. Articles costing less than \$100 were exempt. In little more than a month the board moved to tighten these installment credit controls, and on Oct. 13 the first amendment to regulation W was announced, to become effective Oct. 16.

On Oct. 10 the board announced regulation X (effective Oct. 12) imposing controls on all real estate credit not extended, insured or guaranteed by the federal government for constructing, financing and purchasing new houses. At the same time, the Federal Housing administration and the Veterans' administration issued new regulations designed to produce a similar tightening of credit under federal programs.

Regulation V (effective Sept. 27, 1950) instituted a program of loan guarantees for defense production. The guaranteeing agencies named in the executive order were the departments of army, navy, air force, commerce, interior, agriculture and the General Services administration. The program was to be administered through the federal reserve banks. Each agency was authorized to guarantee loans made by banks and other lending institutions to individuals and private corporations for the purpose of financing contracts and other operations for procurement of materials and the performance of services for the national defense.

**Prices.**—The movement of prices during the year, both wholesale and retail, reflected the building up of the inflationary pressures within the U.S. economy prior to the Korean war, and

quickly registered the force of the immediate impact of the war upon the economy. The department of labour's all-commodity index of wholesale prices for June reached 157.3, an increase of 3.7% from January, and the all-items index of consumers' prices at retail reached 170.2, an increase of 1.9% from January. Wholesale prices of farm products and of foods had advanced during the six months 7.2% and 4.2% respectively, and wholesale prices other than food products had advanced 2.7%. Food prices at retail were 4.3% higher in June than in January. In July as compared with June, the all-commodity index of prices at wholesale was up 3.5%, of farm products 6% and of foods 5.7%. Prices continued to rise through September but at a less rapid rate. However, for the four-month period June through September the all-commodity index of wholesale prices increased 7.7%, an increase for the four-month period that was more than double the increase during the first six months of the year. Food prices at wholesale during this same four-month period rose 9.3%, also more than double the increase during the first six months of the year. In October, the indexes of prices at wholesale dropped slightly as did also the retail food index, but the indexes of all the other items in the consumers' price index continued to rise. (See also PRICES.)

**Employment, Income, and Saving.**—By June 1950 total U.S. civilian employment had reached 61,400,000 and unemployment had dropped to 3,300,000 or only 5.2% of the civilian labour force. By October, employment had reached 61,700,000, and unemployment had dropped to 1,900,000. Average hourly and average weekly earnings meanwhile increased steadily. According to the department of labour, average hourly earnings in all manufacturing increased from \$1.41 in January to \$1.48 in September, and average weekly earnings increased during the same period from \$54.70 to \$60.53.

Total personal income in June, according to reports of the department of commerce, was at the annual rate of \$217,100,000,000, compared with an annual rate of \$214,600,000,000 in January; the preliminary estimate for September was an annual rate of \$228,300,000,000. The disposable personal income (income less taxes) during the second quarter of the year was at an annual rate of \$195,500,000,000, and for the third quarter, at \$202,000,000,000. Personal consumption expenditures, the real measure of effective market demand, rose from an annual rate of \$184,500,000,000 during the second quarter of the year to \$195,000,000,000 during the third quarter. The extent to which consumers exchanged dollars for commodities was reflected in the drop in personal net savings from an annual rate of \$15,300,000,000 during the first quarter of the year to \$11,000,000,000 in the second quarter, and to \$7,000,000,000 in the third quarter. Net savings as a per cent of disposable income dropped from 7.7% in the first quarter to 5.6% in the second quarter, and to 3.5% in the third quarter. (See also INCOME AND PRODUCT, U.S.)

**Consumer Credit.**—The expansion in U.S. consumer credit, increasing steadily since the end of World War II, was greatly accelerated in 1950. Total credit outstanding in June 1950 reached \$19,600,000,000, an increase of \$741,000,000 from January. By September, consumer credit outstanding had reached \$21,500,000,000, an increase during the third quarter alone of \$1,800,000,000.

Instalment credit, which accounted for slightly more than 60% of total consumer credit outstanding during 1950, increased by \$2,400,000,000 during the first nine months of the year, a larger increase than for any full postwar year. Two-thirds of the increase for the nine-month period occurred during the four months June through September. Instalment credit outstanding in September amounted to \$13,300,000,000, an increase of \$1,700,000,000 from the amount outstanding in May.

The reinstatement of regulation W, as described above, was

a recognition of the inflationary danger inherent in such rapid growth in instalment credit. (See also CONSUMER CREDIT.)

**Bank Credit.**—U.S. commercial bank credit began to expand in May 1950 and continued to expand at a very rapid rate through September. Commercial banks increased their total loans by \$4,200,000,000 during the third quarter of the year, and their holdings of state and local government and corporate securities by about \$900,000,000. During the four-month period June through September, the expansion in credit to private borrowers and to state and local governments exceeded that in any peacetime period of similar length, according to reports of the board of governors of the federal reserve system. Commercial bank loans in September stood at \$49,000,000,000, an increase of \$4,200,000,000 from June, as compared with a January to June increase of \$1,900,000,000 (from \$42,900,000,000 in January to \$44,800,000,000 in June).

In addition to business loans, a large factor in the expansion in private credit was credit extended by banks and other lenders to purchasers of houses. New loans on small residential property during the first nine months of 1950 amounted to slightly less than \$11,000,000,000, or an annual rate of \$14,500,000,000 as compared with an annual rate of about \$11,000,000,000 in each of the three previous years. Mortgage debt outstanding on one-to-four-family houses increased by about \$2,000,000,000 during the third quarter, compared with an increase of slightly less than \$4,000,000,000 during the entire year 1949. Loans of commercial banks on homes and other real estate increased during the third quarter by about \$900,000,000, which was about as great as the increase during the first six months of the year. (See also BANKING.)

**Money Supply and Turnover.**—The rapid expansion in bank credit added greatly to the U.S. money supply. During the third quarter of 1950, the total of currency and bank deposits held by individuals increased by \$1,500,000,000 to a new peak level of \$171,500,000,000 in September. This rapid rate of increase almost equalled that of the third quarter of 1947, also a period of substantial inflation. In addition to the effect of the increased volume of money on spending, spending after the middle of the

"CONSTRUCTOR ON THE LOOSE," a 1950 cartoon by Bishop of the St. Louis Star-Times

SIDE-LINE PRODUCTION of bridge caissons at the Newport News shipbuilding yards where contracts for these and other products were undertaken to balance a slump in the shipbuilding market during the first half of 1950

year was financed in part by more active use or turnover of money. During the third quarter of the year, the turnover of demand deposits at banks in leading cities outside New York city was greater than the corresponding quarter in any postwar year, and greater than at any time in more than a decade. Demand deposits in September amounted to \$88,100,000,000, an increase of \$3,100,000,000 from June.

**Production.**—Industrial production in the United States, as measured by the federal reserve board index, increased steadily throughout the first ten months of 1950 with only minor interruptions in February and July. The index in October reached 212 as compared with 183 in January, an increase of 15.8%, and was at the highest level since 1945. More than half of this increase occurred during the first six months of the year, prior to the Korean war. There was a slight drop of 3 points in July followed by a 14-point rise in August, with gains of 1 and 2 points in September and October, respectively. The increase occurred in both durable and nondurable goods industries, but was much greater in the former. The durable goods index rose from 209 in January to 254 in October, a gain of 21%; the nondurable goods index rose from 179 in January to 194 in October, a gain of only 8.4%. Slightly more than half of the ten-month increase in the durable goods index occurred during the first six months of the year, the index reaching 236 in June, a rise of 27 points or 12.9%. The nondurable index rose only 4 points or 2.2% during the first half of the year. Both indexes dropped slightly in July but by October the durable goods index had risen 19 points, and the nondurable index 13 points, gains of 8% and 7.1%, respectively.

Steel production declined during the first quarter of the year, but after March, the industry operated at near capacity through September, and reached a new production peak in October at 102% of theoretical capacity—up 2% from September; more

than 8,700,000 tons of steel ingots and castings were produced. According to the U.S. department of commerce, defense production represented only a small fraction of the total volume of production through October.

**Construction.**—The upturn in U.S. construction activity which began in the fourth quarter of 1949 continued without interruption through the first nine months of 1950 with only a minor drop in the total volume in October. For the first ten months of the year, the monthly average value of total new construction was \$2,200,000,000 as compared with a monthly average of \$1,800,000,000 in 1949 and \$1,700,000,000 in 1947. The 1950 expansion in construction occurred almost entirely in private construction, federal, state and local construction having remained substantially unchanged in volume throughout the year, representing only about one-fourth of the total. Of total private construction, nonfarm residential construction accounted for about 60% of the total, amounting to slightly less than \$1,000,000,000 per month during the first four months of the year, and slightly more than \$1,000,000,000 per month during the five-month period ending with October. (See also BUILDING AND CONSTRUCTION INDUSTRY; HOUSING.)

**New Plant and Equipment.**—Expenditures for new plant and equipment in the U.S. during the first quarter of 1950, at an annual rate of \$14,800,000,000, were lower than in any quarter during the previous two years. Expenditures were stepped up, however, to an annual rate of \$17,300,000,000 during the second quarter and jumped to \$20,200,000,000 during the third quarter. The rate during the third quarter was greater than in any quarter of the previous two years except the fourth quarter of 1948.

Expenditures for new plant and equipment in manufacturing during the third quarter of 1950 were at an annual rate of \$9,000,000,000 compared with \$6,000,000,000 during the first quarter and \$7,400,000,000 during the second quarter. The third quarter rate was only slightly below the previous peak, reached in the fourth quarter of 1948.

**Business Profits.**—U.S. business profits after taxes rose substantially during the first three quarters of 1950 following the decline in 1949 from the high level of 1948. Profits after taxes, as estimated by the department of commerce, were at an annual rate of \$17,200,000,000, which was about the rate which maintained during each of the four quarters of 1949. During the second quarter of 1950, profits jumped to an annual rate of \$22,200,000,000 and rose to \$24,400,000,000 during the third quarter. Dividend payments were substantially greater in each of the first three quarters of 1950 than in the corresponding quarter of 1949. In the third quarter, dividends were at an annual rate of \$9,100,000,000 as compared with \$7,400,000,000 in the same quarter of 1949, and with \$7,700,000,000 in 1948, the previous peak profit year. Undistributed profits also mounted steadily, from an annual average rate of \$9,100,000,000 during the first quarter to \$14,100,000,000 during the second quarter and \$15,300,000,000 during the third quarter. (See also EMPLOYMENT; INTERNATIONAL TRADE; LAW.) (V. B. B.)

**Other Countries.**—Apart from the long-term trend towards the higher use of power and more rapid communications (illustrated by striking increases in the production of electric power and in civil aviation and by the large tonnage of tankers under construction) business conditions outside the United States in 1950 were governed principally by the continued working-out of the devaluation policy adopted under the lead of the United Kingdom by a number of important countries in the autumn of 1949.

In consequence of devaluation the world bought less from the United States; during the first half of 1950 U.S. exports fell to \$4,899,000,000 as compared with \$6,694,000,000 in the first half of 1949. The world's dependence on goods obtained from the United States without immediate payment thus became less by one-third of what it had been. Since Marshall aid was tapering off, the effect of devaluation was to place world business on a more lasting foundation and to supplement U.S. aid in spreading the demand for raw materials which in any case was being fostered by the U.S. stock-piling program.

At the beginning of 1950 industrialists had not yet decided that it was worth while to spend money on increasing the existing apparatus of production all around; and hesitations of this kind were partly reflected in the Schuman plan, or European coal and steel pool. But on the whole the amount of money waiting for employment was increasing. If optimism had been universal, a due proportion of this money would have been used in bidding for (and consequently in raising the price of) industrial shares; but there was in fact a striking divergence between the downward trend of industrial share prices and the upward trend of money available in a number of places. This development was

manifest some months before the Korean crisis.

But these were warning signs rather than tangible indications of a decline: in most directions the statistical symptoms were good. At the turn of the year the price of raw materials had not diverged widely from the level ruling a year earlier; and soon thereafter prices began to rise, so that by the end of June—long before the Korean war had made itself fully felt—substantial gains in the prices of maize, cocoa, rubber, hides, wool, copper, zinc and steel scrap were recorded in U.S. quotations (not affected by devaluation).

Outside the United States the world's most important group of trading countries was that constituted by the former belligerents in western Europe and by Japan. The most striking aspect of business conditions in these countries lay in their recovery from the abnormalities of World War II. Production in most instances was actually higher than before the war, and governments were able to finance their needs largely without recourse to the printing press.

Within this group a special position belonged to the defeated powers—Germany, Italy and Japan. All had suffered particularly heavily during the war, and in all recovery had been delayed. But by 1950 recovery was more rapid in western Germany and in Japan than in the victorious states, which by 1950 had already completed a respectable advance.

In Belgium and France industrial production was barely maintained; and, in striking contrast to what was happening in the rest of Europe, production of electric power did not increase. Switzerland showed the characteristic danger signs—rising unemployment and a fall in wholesale prices and in the cost of living.

The remaining former belligerents of western Europe comprised the United Kingdom, the Netherlands, Denmark and Norway; and Sweden could conveniently be considered with them. These countries shared a general business recovery. In Norway and Denmark, for example, the output both of consumers' and of capital goods increased, particularly in the former country. Unemployment either diminished or was so small that its fluctuations were negligible. Prices were steady or tended to rise.

In 1950 the world's demand for raw materials accentuated the trend of earlier years: essential foodstuffs continued to matter less; base metals and semiluxuries like coffee mattered more. The effect was noticeable for example in Argentina, where it proved difficult to find a remedy for the disadvantages resulting from this shift. On the other hand, Brazil gained from the striking rise in the price of coffee which began in the last quarter of 1949 and continued in 1950. Later in the year the higher prices and larger sales of wool, hides and cocoa made themselves felt in Latin America generally. The growing demand from the United States was particularly important; and in this respect the experience of the so-called "banana republics" of Central America was characteristic. These countries also benefited by an improvement in the terms of trade, for example in the matter of imports of machinery, steel and chemicals from western Germany.

In the great rubber- and tin-producing area of southeastern Asia business was helped because strongly rising prices accompanied a vigorous rise in production reflecting a return to more normal conditions. During the first six months of the year Malayan exports of tin and rubber sufficed, despite devaluation, to earn substantially more dollars than during the corresponding period of 1949. In Indonesia the output of rubber went ahead rapidly and the boom in exports was accompanied by a boom in imports. This development began before the Korean war.

Conditions were different in the great raw-material producers, Canada and Australia, where the course of business was also determined by industrial factors. The Canadian economy, being closely linked to that of the United States, had suffered from the

INDUSTRIAL PRODUCTION of U.S. durable and nondurable goods, 1939-50, adjusted for seasonal variation (1935-39=100) (Source: Board of Governors of the Federal Reserve System)

temporary recession there and had not fully recovered by the beginning of the year. As in the United States, expenditure during the earlier months centred on consumption goods rather than on capital goods, and the production of base metals remained sluggish. As the year went on, however, Canada began to share the business activity of the United States, and by the middle of the year industrial output and international trade reached and maintained new high levels. In Australia, on the other hand, devaluation gave an early stimulus to exports: business sentiment was cheerful; prices, including those of ordinary shares, rose, and people were prepared to invest in capital schemes. Toward the end of the year there were signs of a boom.

In the U.S.S.R. the output of meat and of other foodstuffs fell fairly severely short of the production plan. The production of spinning machinery increased but was not reflected in a higher production of textiles. As in other countries the output of electric power and of the engineering industry was high. There was a bad muddle in the timber industry, which hampered the production of cellulose and paper. A large increase in the manufacture of private cars had an odd parallel in the similar increase (relative to that recorded for commercial vehicles) in western Germany and in France, where the middle and upper middle classes were growing in strength. The reduction in the price of a large range of consumption goods decreed in connection with the revaluation of the rouble in March might have been expected to increase turnover, and when business failed to respond the blame was put on the retailing agencies.

As a result of the general rearmament in the second part of the year an abrupt sharpening occurred in the world demand for a wide range of goods. This made itself felt in a striking manner on the great producers of raw materials, who were in any case favoured not only by the turn of the trade cycle but also by the long-term development of world business. World production of wool, for example, was still well below the artificially high level reached during World War II and slightly below the prewar level, whereas consumption was already high, with the result that stocks were nearly exhausted. At the wool sales in the autumn, though the Korean war and the resultant rearmament certainly contributed to it, the rise in prices was due equally to world-wide pressure for higher standards of living. ## Cabinet Members.

The following members of President Harry S. Truman's cabinet held office on Jan. 1, 1951.

Post	Name	State
Secretary of State . . . .	Dean G. Acheson . . . .	Maryland
Secretary of the Treasury . . . .	John W. Snyder . . . .	Missouri
Attorney General . . . .	J. Howard McGrath . . . .	Rhode Island
Postmaster General . . . .	Jesse M. Donaldson . . . .	Illinois
Secretary of the Interior . . . .	Oscar L. Chapman . . . .	Colorado
Secretary of Agriculture . . . .	Charles F. Brannan . . . .	Colorado
Secretary of Commerce . . . .	Charles Sawyer . . . .	Ohio
Secretary of Labor . . . .	Maurice J. Tobin . . . .	Massachusetts
Secretary of Defense . . . .	George C. Marshall . . . .	Pennsylvania

**Great Britain.**—On Jan. 1, 1951, the British cabinet was composed as follows.

Post	Name
Prime Minister and First Lord of the Treasury . . . .	Clement Richard Attlee
Lord President of the Council and Leader of the House of Commons . . . .	Herbert Stanley Morrison
Secretary of State for Foreign Affairs . . . .	Ernest Bevin
Chancellor of the Exchequer . . . .	Hugh Todd Naylor Gaitskill

Post	Name
Minister of Town and Country Planning . . . .	Edward Hugh John Neale Dalton
Lord Privy Seal and Leader of the House of Lords . . . .	Viscount Addison
Chancellor of the Duchy of Lancaster . . . .	Viscount Alexander of Hillsborough
Lord Chancellor . . . .	Viscount Jowitt
Secretary of State for the Home Department . . . .	James Chuter Ede
Minister of Defence . . . .	Emanuel Shinwell
Minister of Labour and National Service . . . .	George Alfred Isaacs
Minister of Health . . . .	Aneurin Bevan
Minister of Agriculture and Fisheries . . . .	Thomas Williams
Minister of Education . . . .	George Tomlinson
President of the Board of Trade . . . .	James Harold Wilson
Secretary of State for the Colonies . . . .	James Griffiths
Secretary of State for Scotland . . . .	Hector McNeil
Secretary of State for Commonwealth Relations . . . .	Patrick Chrestien Gordon-Walker

**Calendar of Events, 1950:** see pages 1-16.

**California.** The most southerly Pacific coast state of the United States, California on Sept. 9, 1950, celebrated the centennial of its acquisition of statehood. Nicknamed the "Golden state," California ranks second nationally in both area and population. Its land area consists of 156,803 sq.mi. and its water area is 1,890 sq.mi. The official U.S. bureau of the census 1950 determination placed the population at 10,586,223, representing an increase of 53.3% over the 1940 census. Chief cities, preliminary census figures (with 1940 populations in parentheses) were: Los Angeles 1,957,692 (1,504,277); San Francisco 760,753 (634,536); Oakland 380,576 (302,163); San Diego 321,485 (203,341); Long Beach 244,072 (164,271); Sacramento (state capital) 135,761 (105,958); Berkeley 113,217 (85,547); Pasadena 104,087 (81,864); Richmond 99,218 (23,642); Glendale 95,398 (82,582); San Jose 95,044 (68,457).

**History.**—In the general election held Nov. 7, 1950, the electorate gave incumbent Gov. Earl Warren an overwhelming vote of approval for a third term when he was elected by a virtual two to one majority over James Roosevelt, the Democratic party nominee. Incumbents were re-elected to all state offices considered by the voters with the exception of attorney general (incumbent not a candidate). The 1950 state officers were: governor, Earl Warren; lieutenant governor, Goodwin J. Knight; secretary of state, Frank M. Jordan; treasurer, Charles G. Johnson; controller, Thomas H. Kuchel; attorney general, Edmund G. Brown; superintendent of public instruction, Roy E. Simpson. State voters adopted propositions for reorganization of state inferior courts and for requiring local elections prior to establishment of public housing projects. Propositions to repeal personal property taxes, and to legalize and license gambling within the state were defeated by large majorities. The primary election in June provided for a \$100,000,000 bond issue for home and farm loans to California veterans.

Daylight saving time was inaugurated in California.

Attempting to curtail Communist activities in California, the Board of Regents required a loyalty oath from employees of the University of California. The legislature subsequently required a similar oath of public employees and civil defense workers.

**Education.**—Average daily attendance for budgetary purposes for 1948-49 in elementary school districts was calculated at 1,134,300, in high school districts at 400,833 and in junior college districts at 81,714. Enrolment for the fall semester 1950 in the University of California's eight schools and the nine state colleges totalled about 66,000.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—As of Oct. 1950, average monthly payments to 271,868 needy aged of California was \$69.57 (Oct. 1949, 264,672 at an average of \$70.74). The security for the blind program paid an average of \$82.21 monthly to 10,087 persons. Average monthly assistance payment for 134,458 needy children, both in boarding homes and institutions and in families, was \$47.34. Public

assistance was supported 39% by federal funds, 44.9% by the state and 16.1% by county money. For Oct. 1950 beneficiaries of the three unemployment compensation programs administered by the state averaged 72,100 per week, and total benefits for the month were approximately \$8,500,000.

Total expenditures for the state department of corrections for 1949-50 were estimated at \$10,437,986. Inmates of California's seven correctional institutions for adults (as of Oct. 1950) numbered 11,482. The population of California youth authority institutions was 2,401 of which 291 were in its two schools for girls, 296 in its four work camps for boys, 1,085 in its four boy's schools and the remainder in other institutions.

**Communications.**—Automobile and truck registrations for 1949 were 4,101,191. As of June 1949, the state division of highways reported the total mileage of state roads as 13,994.2 mi. Estimated state expenditure in 1949-50 for reconditioning, resurfacing and construction of highways was \$109,134,197 (1948-49 \$98,279,962). Of this amount approximately \$15,242,105 were federal-aid contributions (1948-49 none). In 1940 California had 16,856 mi. of railroad, of which 2,768 were electrically operated. In 1949 California maintained 463 airports, including 193 commercial, 142 municipal, 39 military and 89 other fields. There were 2,824 mi. of federal airways. At the beginning of 1949 there were 3,325,000 telephone stations within the state.

**Banking and Finance.**—Total assets of the 117 state-supervised banks (with 206 branch offices) as of Oct. 4, 1950, were \$3,880,601,000 (July 1949, \$3,595,312,000). At the end of 1949 there were 118 banks (with 904 branches and offices) that were members of the federal reserve system. Total bank debits as of April 1950 were \$87,318,000,000 (April 1949, \$88,332,000,000). Aggregate assets (as of Sept. 30, 1950) of 114 state-licensed savings and loan associations operating in California were \$627,605,748.86.

Estimated total state revenue for 1949-50 was \$841,600,157 (1948-49 \$783,993,662). Total expense estimates for the year were \$1,166,762,418 (1948-49, \$883,324,599). Estimated budget deficit was \$325,162,261, and the state's net bonded debt (as of Nov. 30, 1949) was \$181,739,915.

**Agriculture.**—Gross cash farm income in 1949 was \$2,066,431,000, or 3.7% lower than in 1948. Livestock and livestock products returns were \$771,189,000 (7.1% lower than 1948), while crop returns were relatively unchanged at \$1,286,022,000 (1948, \$1,302,555,000). Government payments of \$9,220,000 (1948, \$13,611,000) constituted 0.5% of California's cash farm income. Total value of truck crops for 1949 was \$280,197,000 (a 2.5% increase over 1948), value of field crops was \$634,852,000 (a 4.9% decrease), and fruit and nut crop value was \$345,523,000 (a decrease of 16.5%).

Table I.—Leading Agricultural Products of California

Crop	1950	1949	Average, 1939-48
Cotton lint, bales . . . . .	930,000	1,268,000	501,000
All hay, tons . . . . .	6,442,000	5,771,000	5,599,000

Peaches, bu. . . . .	29,460,000	35,211,000	29,161,000
Rice, bags (100 lb.) . . . . .	7,772,000	10,234,000	6,011,000
Pears, bu. . . . .	14,251,000	16,335,000	11,413,000
Apples, bu. . . . .	6,496,000	9,445,000	7,814,000
Grapes, tons . . . . .	2,411,000	2,485,000	2,583,000
Apricots, tons. . . . .	200,000	165,000	207,400

**Manufacturing.**—Employment in California manufacturing industries rose to 843,300 in Sept. 1950. Likewise civilian employment reached a peak of 4,488,000, accompanied by the lowering of unemployment to 143,000 in Oct. 1950 as compared with 317,000 unemployed in Oct. 1949. Retail sales for 1949 were approximately \$10,770,000,000. U.S. department of commerce estimates of new construction within the state in 1949 were \$2,441,400,000 (1948, \$2,863,700,000), of which \$541,900,000 was public construction and the remainder private building.

Table II.—Annual Average Employment in California Manufacturing Industries

Industry	Oct. 1950	Average 1949	Average 1948
Food and kindred products. . . . .	158,100	128,200	131,900
Aircraft . . . . .	102,100	80,500	75,000
Fabricated metals . . . . .	61,200	46,500	51,000
Lumber and wood products . . . . .	58,200	45,800	50,100
Apparel . . . . .	54,600	48,600	49,200
Machinery (except electrical) . . . . .	53,200	47,700	54,600
Printing and publishing . . . . .	48,600	47,300	46,200
Primary metals. . . . .	44,200	34,200	37,900
Stone, glass and clay . . . . .	35,900	31,600	33,300
Chemicals. . . . .	31,500	28,600	29,300
Furniture and fixtures . . . . .	30,100	23,000	24,500
Electrical machinery. . . . .	30,100	21,000	20,600

During 1949 an average of 700,100 wage and salary workers were employed in California manufacturing industries. In production of nondurable goods 319,900 were employed, and 380,200 in manufacture of durable goods. Total pay rolls for manufacturing industries amounted to approximately \$2,453,300,000 (1948, \$2,492,400,000).

**Mineral Production.**—Mineral production in California in 1949 was estimated at \$1,103,127,000, or 6.1% less than in 1948.

Table III.—Value of Principal Minerals Produced in California

Product	Value 1949	Value 1948
Petroleum. . . . .	\$753,248,000	\$823,696,000
Natural gas. . . . .	66,244,000	64,803,000
Cement. . . . .	57,394,000	57,742,000
Gold . . . . .	14,361,000	14,752,000

FILMS OF 1950.—*North from Monterey* (Paul Hoefer Productions). (D. C. Cr.)

**Cambodia:** see FRENCH UNION; INDOCHINA.

**Cameroons:** see BRITISH WEST AFRICA; TRUST TERRITORIES.

**Cameroun:** see FRENCH EQUATORIAL AFRICA; FRENCH UNION.

**Camp Fire Girls:** see SOCIETIES AND ASSOCIATIONS.

**Canada.** A member of the British Commonwealth of Nations, America north of the United States except Alaska. Provinces: Nova Scotia, New Brunswick, Quebec, Ontario, Manitoba, British Columbia, Prince Edward Island, Alberta, Saskatchewan and Newfoundland. Outside the provincial boundaries are the Yukon and the Northwest Territories, under federal jurisdiction.

Area, 3,843,144 sq.mi. Capital: Ottawa (*q.v.*). Largest English city: Toronto (*q.v.*). Largest French city: Montreal (*q.v.*), pop. (1948 est.) 1,096,000. Governor general: Viscount Alexander of Tunis. Prime minister: Louis Stephen St. Laurent. On June 1, 1950, the dominion bureau of statistics estimated Canada's population at 13,845,000, compared with 11,506,655 in 1941.

**History.**—*Politics.*—The Liberal government under Louis St. Laurent (*q.v.*) remained in power during 1950. Nine federal by-elections were held during the year, of which the Liberals held six and lost two to the Progressive-Conservatives. The Progressive-Conservatives held one. The Social Credit party divided its national party responsibilities between a national leader and a national president; renewed its political invasion of Saskatchewan; and continued its internecine warfare with *L'Union des Électeurs* (the Social Credit arm in Quebec province).

**Legislation.**—The second session of the 21st parliament was called on Feb. 16 and prorogued on June 30. It passed important legislation in the defense, social welfare, agriculture, veterans and hydroelectric fields. An emergency session of parliament met on Aug. 29 and recessed on Sept. 15. It passed legislation: (1) ordering railway strikers back to work and establishing minimum terms of settlement of the railway unions dispute; (2) recognizing by statute for the first time Canada's obligation to contribute overseas forces for collective defense under the United Nations charter and the North Atlantic treaty; and (3) appropriating \$300,000,000 to send arms to other participants of the collective security system. Other special session laws related to economic controls and consumer credit. The government set up two new crown companies: the Canadian Overseas Telecommunication corporation and Defense Construction, Ltd.

**Constitution.**—Dominion-provincial conferences aimed at amending the federal constitution were held during the year. The January meeting agreed that Canada should be able to amend the constitution without recourse to the British parliament, that matters of purely federal jurisdiction should be amendable by the federal parliament without reference to the provinces, that some provisions of the constitution required agreement by all ten provinces and others agreement only by a majority of the ten. A committee was set up to decide where each section of the constitution belonged, and just how the amendment machinery would affect each of the 147 provisions of the British North America act. By the end of the year, there was general agreement about the place of more than 100 of the provisions. One of the chief stumbling blocks was the section which assigned property and civil rights to the provinces.

**Dominion-Provincial Relations.**—The supreme court of Canada ruled that the federal government and the provincial governments could not legally exchange their legislative powers. The court however ruled that its judgment should have no effect upon existing dominion-provincial agreements. During the February-June session of parliament the federal government concluded agreements with provincial governments to implement legislation

on housing and on the transcontinental highway.

*United States-Canada Relations.*—The unsettled international situation drew Canada and the United States close together. A program of United States purchases of defense supplies in Canada on a reciprocal basis was worked out. All restrictions about the operation of warships on the Great Lakes were withdrawn, except that each country must advise the other on the number, disposition, functions and armaments of such ships. Canada approved: (1) the Niagara diversion treaty, to provide for the permanent regulation of the diversion of water from the Niagara for hydroelectric purposes; and (2) the Canada-United States tax convention acts of 1943 and 1944, to avoid double taxation. An agreement eliminated duplication of quarantine inspection requirements for ships and aircraft arriving from other countries.

*Defense.*—Military preparedness was a leading government activity during the year. Parliament unanimously passed Defense Minister Brooke Claxton's 251-clause National Defense act, which concluded a three-year effort to knit Canada's army, navy and air force into a single defense machine. Under the North Atlantic treaty, Canada fully equipped a Netherlands army division and undertook training of air personnel of North Atlantic treaty countries. The Canadian army held arctic manoeuvres, called Exercise "Sweetbriar" and Exercise "Sundog"; more than 44% of the 1949-50 defense appropriations were spent on the air force, the expansion of which included creation of five interceptor fighter squadrons to meet sneak air attacks. The navy was divided into two sections, one to study antisubmarine warfare and the other to train personnel, and the navy was increased until by May 1950 Canada had more men at sea proportionately than had the United States or the United Kingdom. Total army, air force and naval strength was increased from 57,079 to about 81,500 during the year. Secret research—from germ warfare to guided missiles—was conducted in eight laboratories of the Defense Research board. Plans to meet an atomic assault crystallized with the publication of a 46-page government manual on organization for civilian defense.

*Communism.*—Parliament amended the Official Secrets act by extending its provisions to include employees of government boards and commissions in Canada and Canadians outside Canada, by increasing the prison term for espionage from 7 to 14 years and by assuring that persons arrested under the act be fingerprinted. A Progressive-Conservative motion in parliament that communism be outlawed in Canada was defeated 147 to 32, though Canadians voted 7 to 1 in a Gallup poll to enforce registration of Canadian Communists. The royal Canadian mounted police drew up a list of key points which would be automatically placed under guard against sabotage in a war emergency.

*Veterans' Affairs.*—The federal government amended the Militia Pension act by retitling it the Defense Services Pension act, improved the method of computing pensions and gratuities and created a service pension board. The benefits of the War Veterans' Allowance act were extended to British and other Allied veterans with more than 20 years' residence in Canada. Hospitalization and treatment regulations were widened. By 1950 annual postdischarge rehabilitation benefit payments had fallen to \$14,045,500, and Veterans' Land act payments to \$30,500,000.

*Economic Conditions.*—During the first half of 1950 Canada experienced a boom. During May industrial production was 84% greater than in May 1939, 3% greater than in May 1949, and only 2% below peak World War II production. The outbreak of hostilities in Korea modified the boom: business optimism changed to anxiety. Nevertheless, output of iron, steel, gasoline and coal, and production of rubber, leather and wool, were higher in 1950 than during World War II. Production of aluminum, copper, lead, nickel, zinc, chemicals, cotton goods and clothing fell below World War II levels. The cost of living rose to the all-

time high of 170.7 points by November.

*Economic Controls.*—In March the federal government announced the immediate dropping of steel price controls, but in November steel shortages brought a return of compulsory allocation. The government announced federal rent controls would end April 30, 1951. Import bans on U.S. coffee, radios and bathroom fixtures were lifted, which left only a short list of manufactured U.S. products under import control. However, about 90 Canadian products were under close export control, because of Anglo-Canadian food contracts, steel shortages and the possible use of Canada as a back door for reshipment of U.S. goods to Communist countries. The special session of parliament gave the government power, without the declaration of a state of emergency, to control prices, production and distribution of materials within fields to be prescribed by orders in council.

*Taxation.*—The 1950 federal budget gave little tax relief. Corporation taxes were reduced slightly by making 70% ownership necessary before the 10% tax on the first \$10,000 of income applied; petroleum production, refining and marketing were spurred by special tax relief applicable to 1953. The 5% excise tax on soap was repealed; the sales tax on ice cream, fresh milk drinks, prepared whipping cream and articles and materials for use by bona fide public institutions was also repealed.

*Labour Relations.*—The biggest single event in the labour field was the intervention of the federal government in the dispute between management and employees of the Canadian National and the Canadian Pacific railways. At a special session of parliament, the employees were ordered back to work after a 9-day strike, and management and unions were requested to continue their negotiations. Arbitration was undertaken, and on Dec. 19 the government arbitrator announced his decision: a wage increase of seven cents an hour was awarded, effective from Aug. 30, 1950, and a 40-hr. (5-day) week from June 1, 1951. Two days later the railways applied for a 5% freight rate increase, effective at once, and a further unspecified increase effective June 1, 1951.

*Agriculture.*—During 1950, cattle and hog slaughterings and dairy output fell below the World War II rate. Grain production

EVACUATION TRAIN crowded with women and children leaving the flooded areas of Winnipeg, Man. In May 1950, more than a third of the city's residents abandoned their homes as waters from the swollen Red river continued to rush against weakened dikes

was well ahead of the 1943-49 production rate, but October frosts cut deeply into expected production. Wheat estimates of 544,000,000 bu. dropped to 461,730,000 bu., which was still above the 1939-49 annual average of 394,000,000 bu. But the frosts filled the 1950 crop with much poor-quality wheat. Dairy farmers were worried by the expanding sales of margarine and by the privy council decision which sustained a judgment of the Canadian supreme court that the sale of margarine was a matter of provincial jurisdiction. Federal government price support was extended to eggs and butter. Price support operations (for potatoes, apples, dried beans, powdered milk) for the 1946-50 period cost the federal government slightly more than \$10,000,000. The gross value of the 1949 field crops was \$1,420,000,000, or 16% less than for 1948. The cash income of Canadian farmers for the first six months of 1950 was estimated at \$870,516,000, or 18% below the figure for the similar 1949 period.

**Communications.**—The public-owned Canadian Broadcasting corporation ended the 1949-50 fiscal year with a record deficit of \$243,746. Station CBE was opened in Windsor, Ont., 45th in the C.B.C. series. The corporation banned radio bingo and give-away shows early in 1950.

Initial C.B.C. television construction was begun in Toronto and Montreal at a cost of \$4,000,000, with black and white TV planned for Sept. 1951. With the coaxial cable linking Montreal and Toronto to pass through Ottawa, the capital city was promised TV by 1952. In Sept. 1950 there were 19,497 television receivers in Canada on the fringe of U.S. TV broadcasts.

**Natural Resources.**—The biggest individual developments of 1950 came in the oil fields of Alberta and the iron ore deposits of Quebec-Labrador. In Sept. 1950 all-Canada oil output was 2,724,985 bbl. compared with 2,167,332 bbl. in Sept. 1949. During the Jan.-Sept. 1950 period 20,296,851 bbl. of oil and 48,602,675,000 cu.ft. of gas were produced against 15,709,323 bbl. and 42,410,000,000 cu.ft. for the same 1949 period.

Additional test drilling proved that Quebec-Labrador deposits ran to a minimum of 400,000,000 tons of high-grade open-pit ore. Mineral discoveries included vermiculite in Ontario and perlite and quartz crystals in Newfoundland. Canadian mineral production in 1949 reached a record value of \$890,200,000, 8.5% higher than 1948 production.

**Arctic Developments.**—Military activity throughout the arctic was supplemented by much scientific activity. The royal Canadian air force undertook a series of long-range navigational flights over the north pole to develop periscopic sextants to eliminate navigation blisters on aircraft; McGill university (Montreal, Que.) geographers proved that Hudson bay freezes over in mid-winter, contrary to previous beliefs; scientists created a pre-fabricated self-contained arctic hut which could be erected in a few hours, and a lubricant usable in -50° F. weather. United States and Canadian authorities co-operated in a fifth weather station on the northeast tip of Ellesmere Island within 500 mi. of the north pole. The dominion observatory erected Canada's first arctic seismic station at Resolute bay on Cornwallis Island.

**Eskimos and Indians.**—Federal legislation during 1950 extended the vote to Canada's 5,000 Eskimos. To promote Eskimo education, the department of mines and resources issued a third edition of a 95-page volume, *The Book of Wisdom for Eskimo*, which gave simple health and conservation lessons, and supplemented the book with four humorous film strips which told Eskimos about the outside world and helped them solve problems in their own lives.

Indian war veterans became eligible to vote in federal elections, and monthly allowances to aged Indians were raised from \$8 to \$25. Further clarification of the Indian act to fit the Indian for full citizenship was postponed until 1951. Alberta Indians discovered that some of their reserves were potential oil fields,

CANADIAN RAILROAD WORKERS massed for a parade in Toronto, Ont., after a nation-wide strike for higher wages was called on Aug. 22, 1950

but exploration had located no wells by the end of the year. Saskatchewan Indians were given special lessons in gold and uranium prospecting, and Ontario Indians benefited from a federal-provincial agreement to manage and develop Ontario fur resources. The 21 Indian health services centres throughout the dominion were increased to 25; parliament voted \$11,694,839 for 1950-51 Indian-Eskimo medical services.

**Finance.**—The 1950-51 budget estimated revenues at \$2,430,000,000 (1949-50: \$2,549,000,000) and expenditures at \$2,410,000,000 (1949-50: \$2,438,000,000). In 1950 net debt stood at \$13,421,405,490 (1939: \$3,152,559,314). By October Canadian reserves of U.S. dollars reached \$1,600,000,000 (Nov. 1947: \$480,000,000) and the Canadian dollar was unpegged.

**National Income.**—Net national income for 1949 (with 1948 and 1939 in parentheses): salaries, wages and supplementary labour income \$7,630,000,000 (\$7,113,000,000) (\$2,583,000,000); military pay and allowances \$115,000,000 (\$82,000,000) (\$32,000,000); investment income \$2,373,000,000 (\$2,348,000,000) (\$783,000,000); agriculture and unincorporated businesses \$2,859,000,000 (\$2,912,000,000) (\$891,000,000).

**Wages and Hours.**—Average weekly salaries and wages during Aug. 1950 (Aug. 1949 and 1942 monthly average in parentheses): manufacturing \$46.78 (\$44.04) (\$29.17); logging \$42.36 (\$41.06) (\$20.34); mining \$54.81 (\$51.42) (\$34.79); communications \$42.51 (\$40.71) (\$28.13); transportation \$53.19 (\$51.52) (\$35.69); construction and maintenance \$42.96 (\$41.14) (\$26.45); services \$29.05 (\$27.90) (\$17.37); trade \$39.41 (\$37.52) (\$24.07); finance \$42.63 (\$41.50) (\$30.20). Average hours worked per week during Aug. 1950 (Aug. 1949 and 1945 monthly average in parentheses): manufacturing durable goods 42.5 (41.9) (44.3); manufacturing nondurable goods 42.2 (41.7) (43.7); coal mining 39.9 (39.0) (40.2); metallic ore mining 45.3 (45.1) (45.8); building construction 40.3 (41.1) (40.4).

**Employment.**—On March 4, 1950 (compared with year end of 1946 in parentheses), there were 940,000 agricultural workers (1,186,000), 3,856-

000 nonagricultural workers (3,466,000) and 312,000 unemployed (143,000). By Nov. 1950 the number of unemployed had fallen to 167,000.

**Co-operatives.** In 1949 (1948 figures in parentheses) 2,736 (2,608) co-operatives with 1,219,712 (850,608) members did \$1,001,437,990 (\$780,048,955) of business.

**Tourism.**—In 1949 tourists spent \$288,000,000 in Canada (1948: \$280,000,000). During the first six months of 1950 there were 592,369 vehicular entry permits, compared with 573,076 and 503,960 permits for the same 1949 and 1948 periods, respectively.

**Trade.**—Exports for Aug. 1950 (compared with monthly average for 1949 in parentheses) ran to \$257,100,000 (\$249,400,000); imports for Aug. 1950 (compared with monthly average for 1949 in parentheses) to \$259,480,000 (\$230,100,000). The over-all trade deficit for the first eight months of 1950 was \$14,300,000 compared with a surplus of \$83,700,000 for the same 1949 period.

**Industry.**—Production for Aug. 1950 in six lines (with the 1949 monthly averages in parentheses): synthetic rubber, 11,150,000 lb. (8,710,000); shoes, 2,027,000 pairs (3,021,000); wood pulp, 732,800 tons (631,300); steel, 281,300 tons (265,600); automobiles, 24,270 (24,220); radios (July), 56,500 (62,800). Gross manufacturing for 1949 totalled \$12,378,731,000 (\$502,000,000 more than 1948). Total private and public investment for 1950 was estimated at \$3,600,000,000 or \$200,000,000 more than for 1948.

FILMS OF 1950.—*Neighbors to the North* (Teaching Film Custodians, Inc.).

**Canadian Literature.** **Fiction.**—In 1950 four English-Canadian novelists used contemporaneous themes to stress various Canadian areas: Thomas H. Raddall's *The Nymph and the Lamp* was laid on Sable Island off Nova Scotia; Stanley C. Tiller's *Stormswept* described Newfoundland life; Edward McCourt's *Home Is the Stranger* and Flos J. Williams' *Fold Home* both dealt with western Canadian prairies. Grace Campbell reported the problems of a village church minister in *The Tower and the Town*. Historical novels included Louis Vaczek's panoramic *River and Empty Sea*, based on the Canada of the late 1600s; W. A. Plenderleith's lively *Conflict*, going back to the American Revolutionary War; Harwood Steele's *Ghosts Returning*, a brisk account of red-coated mounted police work on the prairies in 1889. *Elizabeth*, by Dick Diespecker, was a character novel with settings in Africa, London and Canada around the turn of the 20th century. Frances Sarah Moore wrote two light romances, *Fair Is My Love* and *Gilded Challenge*. There were English translations of two major 1949 French-Canadian novels, *The Plouffe Family* by Roger Lemelin and *The Outlander* by Germaine Guevremont, translated by Eric Sutton.

**Nonfiction.**—Several important self-revelatory books appeared. *I Kept My Powder Dry* by John Coburn described 50 years of Protestant ministry in Ontario, beginning in 1893. *As the World Wags On* by Arthur R. Ford covered about the same time and ground in the Canadian newspaper field. The most important 1950 biographies were Lorne Pierce's *E. Grace Coombs: Artist*, G. H. Needler's *Goethe and Scott*, H. M. Urquhart's *Sir Arthur Currie* and B. P. Babkin's *Pavlov*.

There were a number of significant books about aspects of World War II. Wilfrid Eggleston reported *Scientists at War*, Scott Young described the Salvation Army's *Red Shield in Action*, Joseph Schull sailed *The Far Distant Ships* of the Canadian navy, R. M. Hickey recalled *The Scarlet Dawn* of his chaplainship and Robert England analyzed the sociological problems of *Twenty Million World War Veterans*. There were side lights of the war in *Canada in World Affairs: September 1941 to May 1944* by C. C. Lingard and R. G. Trotter, and in *Canada in World Affairs: From Normandy to Paris, 1944-1946* by F. H. Soward.

The rest of the 1950 crop of nonfiction books was varied. Dean E. McHenry's *The Third Force in Canada* was a detailed political study of the Co-operative Commonwealth federation (the Socialist party); W. L. Morton's *The Progressive Party in*

Canada similarly studied the agrarian revolt on the prairies in the 1920s. History was prominent: *The Changing Commonwealth* by F. H. Soward, *A Short History of Canada* and *A History of Canadian External Relations* by G. P. de T. Glazebrook, *Empire and Communications* by H. A. Innis and *Empire of the North Atlantic* by G. S. Graham. Books with religious themes included G. R. Cragg's *From Puritanism to the Age of Reason*, Sister Mary Pauline Fitts's *Hands to the Needy* (the Grey nuns), D. A. MacLennan's *A Preacher's Primer*, George C. Pidgeon's *The United Church of Canada*, A. E. Cliffe's *Let Go and Let God* and Lucille A. Neal's *A Way of Life*.

**Poetry and Drama.**—Leading books of poems included James Wreford's *Of Time and the Lover*, Edna Jacques's *Fireside Poems*, J. A. Ross's *The Singer and His Song* and Hyman Edelstein's *Spirit of Israel, and Other Poems*. There were several chapbooks, best of which were Peter North's *Harshly the Rain Fell*, A. S. Bourinot's *Treasures of the Snow*, Goodridge MacDonald's *Beggar Makes Music*, Kathryn Munro's (Mrs. Joseph Freeman Tupper) *Tanager Feather*, Grace Jacombe's *Chalk Dust* and G. Drayton's *Three Meridians*. Robertson Davies' rousing *At My Heart's Core*, set in the Ontario of 1837, was the only play published.

**Juvenile.**—The year 1950 saw the heaviest and best crop of boys' and girls' books ever published in Canada. Fiction with outdoor settings and action had top billing: *Fire Patrol* by Dickson Reynolds (Helen D. Reynolds) was about forest fire fighting; *The Cave at Cormorant Lake* by Frank L. Houghton centred around World War II spies at Halifax; *Abitibi Adventure* by Jack Hambleton had a pulp and paper mill as its theme; *The Mystery Horse* by Louise Riley featured ranching on the prairies; and *The Silent Gulls* by G. E. Tait described game protection along the shores of Lake Huron. T. H. Raddall's *Son of the Hawk* went back to Nova Scotia in 1770, and George F. Clarke's *David Cameron's Adventures* went back to early New Brunswick; both were gripping historical novels. Juvenile nonfiction included books about people: *Canadians*, the lives of 20 great Canadians, by L. J. Henry; *Bay of the North*, the life of Pierre Radisson, by R. Syme; *Football Stars* by Ron McAllister. Maynard Hallman's *Canadians at Work* described Canada's industrial life; Donald Dickie's *The Great Adventure* was an enthralling history of Canada; Foster Hewitt's *Hello Canada! and Hockey Fans in the United States* stated the merits of amateur hockey; L. Knott's *The Children's Guide to Calgary* was packed with western prairie and foothill lore. (See also LITERARY PRIZES.)

(C. CY.)

**Canals and Inland Waterways.** Of the estimated 65,000 mi. of potential inland waterways in the United States, approximately 28,000 mi. had been improved by the end of 1950 for navigation by commercial and pleasure craft. All operations and maintenance of the system, which included 185 harbours and 400 locks, is the responsibility of the corps of engineers, department of the army, under the direction of the congress.

Principal components of the over-all, interrelated system of rivers, lakes, bays and canals include the Great Lakes, the Mississippi river system, the Illinois waterway, the New York state canal system, the Cape Cod canal, the Chesapeake and Delaware canal, the Atlantic Intra-Coastal waterway, the Gulf Intra-Coastal waterway, the Sacramento river system, and the Columbia river system.

The River and Harbor act of 1950 provided \$113,760,500 for the construction of 51 authorized projects in 30 states. An additional \$62,583,906 was appropriated for maintenance, operation and care of the nation's vast network of ports and inland waterways, and \$3,000,000 for planning, preliminary examinations and surveys of new projects. Also in addition, the lower Mississippi

MASSIVE DOWNSTREAM GATES of the Chain of Rocks canal at Granite City, Ill. One of a pair of locks to be completed in 1951, they were to be used for raising and lowering river traffic to levels of the Mississippi channel above and below the hazardous Chain of Rocks by-passed by the canal

river and the Sacramento river in California received separate appropriations of \$61,400,400 and \$2,016,500 respectively for construction, maintenance and operations.

Among the principal projects on which construction was begun or continued during the year were the McNary lock and dam and the Chief Joseph dam on the Columbia river in the interest of navigation, power development and irrigation; the New York and New Jersey channels; Demopolis lock and dam on the Warrior river, Alabama; Houston ship channel, Texas; the Neches and Angelina rivers and the Sabine-Neches waterway in Texas; the lateral canal and lock project on the Mississippi river at Chain of Rocks, near St. Louis, Mo.; Morgantown dam and lock no. 2 on the Monongahela river in Pennsylvania; Cleveland harbour; Missouri river between its mouth and Sioux City, Ia.; Pearl river, Mississippi and Louisiana; San Diego river and Mission bay, California; Jim Woodruff lock and dam, Apalachicola river, Florida. (See also FLOODS AND FLOOD CONTROL; RIVERS AND HARBOURS.)

According to preliminary estimates, the total net water-borne commerce of the United States, eliminating all known duplications of traffic between rivers and ports, was 740,044,573 short tons in the calendar year 1949. Ocean traffic, foreign and coastwise, aggregated 326,729,001 tons.

United States water-borne commerce on the Great Lakes totalled 145,591,636 tons, aggregating 97,503,348,000 ton-miles. Inland waterway commerce, excluding the Great Lakes, totalled 41,892,353,000 ton-miles, including the deep-sea traffic on the Mississippi river below Baton Rouge, La. Of this total, the Mississippi river system accounted for 27,399,192,000 ton-miles.

Preliminary tonnage figures indicated that the following ten were the leading U.S. ocean ports in 1949: New York, N.Y., 128,581,891; Houston, Tex., 36,887,488; Philadelphia, Pa., 34,728,-

541; Baltimore, Md., 33,964,898; New Orleans, La., 29,745,885; Port Arthur, Tex., 23,998,114; Norfolk, Va., 21,179,287; Beaumont, Tex., 20,627,182; Boston, Mass., 15,812,755; Los Angeles, Calif., 15,674,286. (G. H.B.)

**Canada.**—Pressure to create a canal through Chignecto isthmus between Nova Scotia and New Brunswick was increased by the formation of the Chignecto canal committee, which presented a brief to the federal government urging action on the project. Amendments to the shipping act gave police power to curb powerboat speeding in all Canadian canals. Hydraulic gate mechanisms were installed in various Cornwall canal locks on the St. Lawrence river to increase their efficiency. Importance of the St. Lawrence canal system was emphasized when in November a three-day break in the Lachine canal cost shipowners an estimated \$1,500,000. Canal traffic tonnages during the April–October navigation season (with similar 1949 tonnages in parentheses) were: Sault Ste. Marie (Canadian-U.S.) 93,280,572 (91,420,487); Sault Ste. Marie (Canadian only) 1,886,881 (1,979,080); Welland 12,400,905 (11,699,335); St. Lawrence 8,648,438 (6,993,058).

(C. Cy.)

**Great Britain.**—In Aug. 1950 the British Transport commission made its second annual report to the minister of transport, covering the year 1949. A disappointing revenue position was disclosed. In the interests of economy and to eliminate overlapping services, the integration of rail, road and inland waterway services was pressed forward as rapidly as circumstances would allow. A rate plan for merchandise traffic was considered and a draft outline of principles prepared—such principles to be common, wherever possible, to all three services, in particular for classification, conditions of carriage, regulations and chargeable distances. The transport commissioner's report made a useful distinction between canal-owning, on the one hand, and waterway-carrying on the other. On canal-owning in 1949, the commission spent £1,900,000 in working expenses and secured £1,800,000 in gross receipts; in the business of waterway-carrying, working

expenses amounted to £800,000 and gross receipts to £700,000. The deficiencies thus revealed were before reckoning appropriate proportions of the commission's central charges. The commission had added to its fleet in Jan. 1949 by purchasing 172 craft. The net deficit on the year's working (in waterway-carrying) was £86,000 compared with £66,000 in 1948. In canal-owning, the deficiency was slightly reduced. The drought that occurred in 1949 had an adverse effect upon canal-owning revenue, which came mainly from tolls. The closing by the National Coal board of colliery basins on the Staffordshire and Worcester section of the waterways also reduced the tolls.

**France.**—Co-ordination and reconstruction schemes were developed—and in some cases implemented—to repair war damage to the waterways and also to permit the passage of much larger barges. Certain canals connecting with Belgium, Paris and Strasbourg were to accommodate barges of 600 tons and even 1,350 tons as against the old French canal limit of 300 tons. The schemes included major construction projects at the following locks: Jeu de Mail, near Dunkirk; Flandres and Fontinettes, near St.-Omer; Don, between Lille and Lens; Grand Carré at Lille; and Lens.

**Netherlands.**—In 1949 figures were published in the Netherlands showing that inland shipping traffic in 1948 was appreciably higher than in 1947 but still a long way below the pre-World War II level: approximately 24,000 vessels arrived from Belgium, Germany, France and Switzerland, compared with 15,000 in 1947 and 50,000 in 1938.

**Western Germany.**—Traffic through the Kiel canal during Sept. 1950 reached a post-World War II record of 1,790,382 tons, representing 3,670 vessels of which 2,936 were German, 356 Norwegian, 219 Danish and 159 Finnish. (*See also* AQUEDUCTS.)

(A. H. J. B.)

**Canary Islands:** *see* SPAIN.

**Canasta.** This remained the most-played card game in the United States at the end of 1950; it was estimated that 22,000,000 were playing it. It had been the most popular game of Argentina and (in various forms) of other South American countries since 1947 or earlier. English players took up the game during 1950 and it spread rapidly there, though not so rapidly as it had in the United States.

However, toward the end of 1950 the sale of special equipment for playing canasta, and of canasta playing cards, dropped so sharply that some authorities believed the game had passed its peak and thereafter would lose rather than continue to gain adherents.

An international code of canasta laws, similar to the international bridge laws, was written in 1950, for publication in the spring of 1951. Walter L. Richard of New York, co-chairman (with Oswald Jacoby of Dallas, Tex.) of the National Canasta Laws commission of the U.S., went to Argentina in the summer of 1950 and negotiated with the similar Argentine laws commission, so that differences in the methods of playing in the respective countries were removed.

(A. H. Md.)

**Cancer.** For years students of cancer had attempted to discover the cause of cancer, that is, the reason for the changes, and what these minute changes are which enable cells to grow freely in the body without normal tissue controls that keep liver cells in the liver and brain cells inside the skull. Changes in chromosomes of the tissues of the body were accused of undergoing a variety of alterations which it was assumed were responsible for the growth capacity of the cancer cell, but during 1950 this theory received a serious blow in an article by S. Timonen and E. Therman in which the changes in mitotic mechanism of cells was studied on normal human tissues. Normal

TRANSPARENT CHAMBER for studying tumorous tissue in living mice under the microscope, a technique in use at the National Cancer Institute during 1950

human cells were obtained by curettage of the healthy endometrium and compared with cells from human malignant tumours. It had been considered characteristic of neoplastic tissue that more cells are dividing than in corresponding normal tissue. But in the endometrium the frequency of mitosis is about the same as in cancer tissue. Comparing the chromosomes of normal tissues showed many alterations which were thought to be characteristic of cancer. Comparison of the two types of tissues showed that in cancer there are a greater number of alterations in number and structure of the chromosomes, but these may be duplicated in normal tissues. Actively dividing cancer cells display chromosome numbers ranging from 12 to a high number, but these are also seen in normal structures.

While the most constant feature characterizing all cancer cells is the general acceleration in the division rate, this is present also in normal structures. Accelerated speed in chromosomal division is the most evident difference in relation to the slower rate of intrachromosomal changes. The investigations therefore suggested that the origin of cancer is not in the chromosomes but in those structures known as plasmagenes; *see* for example C. D. Darlington. As a matter of fact, W. R. Earle and associates had showed several years before that cells from normal tissues, if cultivated over a considerable period of time, would assume all the capacities of cancer cells.

**Cytologic Diagnosis.**—Another subject of wide interest was the extraordinary development of cytologic diagnosis of accessible cancers. This technique permitted a great increase in diagnosis of early types of accessible cancer, including cancer of the lung which had almost always been diagnosed too late for effective therapy, cancer of the throat and especially cancer of the pelvic organs, where smears can be taken of the surface cells of a growth from the rectum, cervix, and so on. It was obvious that when a diagnosis is based upon a smear only, the possibility of error is greater than when an actual piece of tissue is obtained, but the patient with a positive smear diagnosis is often willing to have a small surgical biopsy to confirm the diagnosis before extensive or mutilating surgery is done. (*See also* CHEMOTHERAPY; MEDICINE; SURGERY; X-RAY AND RADIOLOGY.)

FILMS OF 1950.—*From One Cell* (Sturgis-Grant Productions, Inc.; American Cancer Society, Inc.). (F. C. W.)

**Candy.** Candy sales in the United States in 1950 amounted to about \$1,000,000,000 on the wholesale level. This was higher than the 1949 value of almost \$900,000,000 and only slightly below the record \$1,001,000,000 reported for 1948. The retail volume was approximately \$2,000,000,000.

Expressed in tonnage, the 1950 confectionery business amounted to 2,780,000,000 lb., compared with 2,600,000,000 lb. in 1949 and the all-time production and sales record of 2,804,000,000 lb. established in 1944, when the armed services took tremendous quantities of candy.

More ten-cent candy bars were put on the market and sold successfully in 1950 than during any previous year, with almost every important bar goods house either offering at least one outstanding dime seller or preparing to do so before the turn of the year. Other important developments of the year were (1) the return of the armed forces as substantial buyers of candy, with the industry and the services working out a new set of confectionery specifications; (2) increased emphasis on the mass selling of candy by syndicates and supermarkets; (3) a concerted move taken by large drug chains to sell an increased volume of candy; (4) the creation of special television confections (especially adapted for consumers to eat while watching television); (5) development of new machines, with special emphasis on wrapping equipment; (6) the acute shortage of Cellophane; (7) the return of Europe as a major source of chocolate and candy equipment, with particularly notable strides having been made in this direction by Belgium and Italy; and (8) the increased flow of candies from the continent, especially from England.

Candy bars, together with five- and ten-cent specialties, comprised considerably more than 50% of all confections made and sold in 1950. Package goods accounted for 22%, bulk goods 20% and penny goods less than 4%.

Chocolate-coated and chocolate-containing candies continued to dominate the consumer demand. Moulded (solid) chocolate goods were also in strong demand, although slightly below the 1948 records. The \$1.00 to \$1.50 per pound box of candy was the most popular range in the fancy goods field, with retail manufacturers charging \$1.25 per pound box in most markets for minimum price chocolate-coated goods. Cellophane window boxes, weighing from six ounces to one pound and containing various types of candies, were among the most popular in mass selling establishments. Panned goods led the field in this category. (See COCOA.)

As in previous years, the United States continued to be the greatest candy-producing country in the world, although Great Britain still led the world in per capita consumption. The per capita consumption in the United States in 1950 was slightly more than 18 lb. In Great Britain it was 22 lb.

More than 5,000,000 lb. of candy were imported into the United States in 1950, compared with 3,364,000 lb. in 1949 and 2,936,000 lb. in 1948. Candy exports from the United States declined to an estimated 10,000,000 lb. in 1950, compared with 13,359,000 lb. in 1949. (H. D. G.)

**Cane Sugar:** see SUGAR.

## Canning Industry.

The United States and territorial pack of canned fruits, juices, vegetables, fish,

milk and fruit and vegetable specialties in 1950 totalled approximately 560,000,000 standard cases (preliminary estimate) compared with 534,000,000 standard cases in 1949. These figures do not include poultry and other unclassified specialty products packed by the canning industry. Preliminary statistics for the 1950 pack compared with that for 1949, in terms of millions of standard cases, were shown as follows:

	1950	1949
Fruits . . . . .	80.0	79.0
Fruit juices . . . . .	60.0	62.0
Vegetables . . . . .	175.0	178.0
Fruit and vegetable specialties . . . . .	110.0	100.0
Milk . . . . .	68.8	66.2
Fish . . . . .	29.0	25.7
Meat* . . . . .	36.9	23.2

\*Total pounds divided by factor of 45.

Small to moderate increases were noted for 1950 in the packs of fruits, fruit and vegetable specialties, milk and fish, with a large increase in the case of canned meats. Packs of fruit juices and vegetables showed small decreases. On the basis of year-end estimates, the total pack increase for 1950 was 4.8%.

As in 1949, retail prices of canned fruits and vegetables, according to data from the U.S. bureau of labour statistics, remained closer to pre-World War II levels than other foods, showing an increase from the 1935-39 base years of about 45% as against 100% for all foods.

The bureau of agricultural economics of the U.S. department of agriculture estimated the per capita consumption of canned fruits and vegetables at 144% of the 1935-39 average.

The International Tin Study group estimated the world production of metallic tin for Jan.-June 1950 at 86,000 long tons with consumption at 70,700 tons during this period. Estimated production and consumption for 1950 were 165,000 tons and 139,000 tons, respectively. Production and consumption for the year 1949 were 168,800 tons and 119,200 tons, respectively. World tin stocks (metallic tin and concentrates) in June 1950 were 218,500 tons which included 100,000 tons (estimated) transferred to the U.S. stock pile.

The price of tin on the world market on Nov. 1, 1950, stood at £1,000 per ton, which represented a 340% increase over the average price of £226 for 1939. Substantial price increases above this point were made before the end of the year. Hostilities in Asia provided cause for concern regarding continuation of the Malayan tin supply. (See also TIN.)

In Dec. 1950 representatives of primary users of tin met with the National Production authority to discuss a pending tin conservation order designed to reduce over-all tin consumption beginning in Jan. 1951. It was understood that NPA was looking to a year's reduction in tin consumption of approximately 25%.

Technological developments in the canning industry showed marked advance during 1950. In particular, attention was directed toward the perfection of equipment adapted to the purpose of "high-short" (high temperature-short time) processing. Most existing equipment of this kind utilizes the principle of rotation or agitation of the can contents during processing. Other types involve the rapid treating of homogeneous products followed by handling of the sterilized product and sealing of the cans under aseptic conditions.

Progress was made on fundamental studies relating to sterilization by means of cathode rays; this investigation promised to be more fruitful than studies on other electronic methods that had been tested. While no commercial application to canning was in sight it was demonstrated that cathode rays would destroy all microorganisms in food products upon exposure of a few seconds with a temperature increase of only a few degrees Fahrenheit.

Nutrition studies supported by the National Canners association and the Can Manufacturers institute were continued with emphasis on a survey of nutritional factors in canned foods for special dietary use. A summary of a principal phase of the eight-year program was prepared for use by nutritionists, dietitians, home economists and others, under the title "Canned Foods in Human Nutrition." (E. J. C.)

**Great Britain and Commonwealth.**—Figures published during 1950 by the ministry of food showed that the production of canned fruit in the United Kingdom increased from 45,200 long tons in 1947 to 89,100 tons in 1949, and of canned vegetables from 242,200 tons in 1947 to 300,800 tons in 1949. Canned soup production fell from 114,100 tons to 71,200 tons, but canned homogenized baby foods increased from 4,300 tons to 7,200 tons.

The canning packs of the following countries in 1950 were roughly proportional to their tin-plate consumption figures which were, in long tons: U.K. 440,000; Canada 190,000; Australia 110,000; South Africa 48,000; western Germany 140,000; France 120,000; the Netherlands 75,000; Italy 55,000; Denmark 30,000; Belgium 25,000; Norway 20,000; remainder of Europe 75,000.

A new can-making factory with a capacity of 300,000,000 cans yearly was built in Canada by the American Can company.

The Commonwealth Scientific and Industrial Research organization investigated the distribution in southeastern Australian waters of tuna, pilchards and other fish for canning. A steady increase in fish canning was noted in western Australia, but the Tasmanian industry experienced difficulties when the British ministry of food ceased to import canned barracuda. The market for dried apples diminished and several factories in Tasmania switched to canning.

In South Africa, the output of canned fish, fish oil and fish meal continued to rise and reached an annual value of £2,000,000. The record production of 5,500,000 thirty-ounce cans of pineapple was reached. The Deciduous Fruit board granted £8,000 and South African canners were invited to contribute a similar amount toward a pilot research cannery. At Thika, Kenya, a new pineapple cannery opened with an annual capacity of 20,000,000 cans.

The British government planned to set up cattle ranches, a canning factory and cold storage in Bechuanaland. A new cannery, costing £500,000, with a capacity of 80,000 cans of beef daily, was opened in Tanganyika in September.

**Cartography.** Cartographic achievements in 1950 were primarily in the nonmilitary field. Use of maps in the United States census, extensive British colonial surveys, and ambitious private and governmental undertakings in the preparation of special atlases were typical of the accomplishments during the year.

**United States.**—The 1950 census involved extensive cartographic preparation by the census bureau that extended over several years. Each census enumerator was provided with a map of the area to be canvassed which ranged from large rural areas to small city tracts. In all, 400,000 maps were prepared. Where suitable, they were direct copies of existing commercial or government maps. In other cases maps were specially compiled for the census from source material available in the census bureau's collection of more than 1,000,000 maps and aerial photographs. The

publication of census data involved further extensive cartographic work in the preparation of many hundreds of maps and cartograms to supplement the statistics.

In May 1950 the U.S. geological survey issued its new official standards for symbolization and style of large-scale maps. Under these specifications linework was finer and symbols embraced topographic features not formerly shown on American maps. The trend toward certain European methods, such as the use of auxiliary contours, was a striking change in the new specifications.

Considerable progress in preparation of shaded contour maps was made by the geological survey during 1950. A special map of the Great Smokies National park, which included geologic as well as topographic data, was outstanding among the shaded maps published in 1950. In addition six standard quadrangles, seven sheets of the Alaska Reconnaissance Topographic Series (1:250,000 scale), two special large-scale maps and three maps of a new state base series at 1:500,000 scale were issued with shaded relief in 1950. The shaded edition of standard large-scale quadrangle maps would ultimately total about 100 sheets selected to include striking examples of various land forms.

The October number of the *Geographical Review* (American Geographical Society of New York) contained the first map of a projected Atlas of Diseases to be published by the society. The map, showing world-wide distribution of poliomyelitis, 1900–50, was prepared by Jacques M. May and was accompanied by a brief text published on the back that listed sources and gave additional data on the disease.

In recognition of the growing need for adequate maps in all phases of urban planning, the city of Cincinnati and Hamilton county, O., instituted a survey to provide large-scale maps of Cincinnati and vicinity. There were 414 sq.mi. involved in the project that would cost approximately \$1,120,000. Aerial photographs were to be the chief source of data for the maps.

The academic position of cartography in the United States was the subject of an interesting review at the meeting of the Association of American Geographers at Clark university, Worcester, Mass., April 5–8, 1950. The papers and discussions of a panel on cartography showed that 70 U.S. colleges had instruction in cartography and in 9 there were distinct series of specialized cartographic courses.

**Europe.**—In Great Britain a revision of the One-Inch Series (1:63,360) was under way in 1950. It was planned to revise all 190 sheets of this series with first emphasis on England and Wales. The first of the revised sheets was scheduled for publication late in 1950. The Half-Inch Series (1:126,720) and Quarter-Inch Series (1:253,440) would be revised progressively as the One-Inch revision was completed. The entire revision program for all scales would cover a period of about ten years. The revision of these maps was in line with a much larger program, initiated after World War II, that involved all the maps of Great Britain.

Extensive cartographic work in British colonies was unveiled in 1950 by M. Hotine of the directorate of colonial surveys. The work was being carried out under provisions of the Colonial Development and Welfare act passed several years before by parliament. The directorate of colonial surveys was established to prosecute the work as cartographic facilities of colonial governments were fully utilized in local cadastral work that had fallen far in arrears during World War II. The program, designed for use in economic development and expansion in the colonies, called for topographic maps at 1:50,000 scale. Contouring on present editions was limited to areas of specific importance with hachures used to express relief elsewhere. The surveys, based primarily on aerial photographs, would utilize about 300 surveyors and cartographers when in full production. In 1950 maps were being drawn covering Nigeria, Uganda, Kenya, Tanganyika,

Northern Rhodesia, Nyasaland, Malaya, Sarawak, North Borneo, Jamaica and the Falkland Island dependencies. In addition surveys were under way in the Gold Coast, British Guiana and Swaziland.

The Lenin Geographical society (U.S.S.R.) early in 1950 announced the completion of a new atlas styled after the *Great Soviet Atlas* issued a decade earlier. The new atlas covered the U.S.S.R. in detail and was accompanied by a gazetteer listing 36,000 place names.

Copies of the first part of a new *Atlas of Denmark*, published late in 1949, were received in the United States in 1950. The atlas was edited by Niels Nielson and sponsored by the Royal Danish Geographical society. The completed atlas would consist of five volumes with more than 800 maps. The text was in Danish and English. Part I was concerned with the landscape of Denmark. Numerous well-designed maps and block diagrams, with descriptive texts, covered the geomorphology in detail.

The European triangulation adjustments that had been under way through the International Association of Geodesy in co-operation with the United States and various European countries since 1945 neared completion in 1950. The central European section was completed in June 1947; the southeastern section in Jan. 1950. The southwestern Europe and northwestern Africa section had been in work for some time while the northern Europe part was initiated in May 1950. The project was planned for completion within a year or two.

**Asia.**—An interesting aspect of the military occupation of Japan appeared in cartography. Previous to World War II there were few road maps of any account in Japan but with the arrival of occupation troops the demand arose. To meet this demand the Nippon Automobile association in 1950 printed several strip maps of important highways. In addition the Japan Travel bureau issued a detailed road map of Tokyo and vicinity. In 1950 the Nippon Map company published a new *Atlas of Japan*, in which the prefectures were shown in detail at scales from 1:130,000 to 1:300,000.

Completion of a large survey project in Iran was revealed by the British in 1950. The mapping was done in conjunction with extensive irrigation and power developments in the Lar valley near Tehran. The project, involving 106 sheets at 1:10,000 and 22 at 1:25,000 scale, was started in 1945, with engineering consultants planning the construction. Photography was undertaken

by the royal air force from June to September 1945 and control was run by royal engineers topographical sections. The drafting of maps was done at Cairo, Egy., but later some were transferred to the war office at London.

In Israel large-scale maps based on aerial photographs were prepared in 1950 for areas selected for economic development. The maps, at scales of 1:1,000 and 1:5,000, were produced by the Jerusalem Institute of Photogrammetry.

**International.**—The fifth general assembly of the Pan-American Institute of Geography and History met at Santiago, Chile, from Oct. 16 to Nov. 1, 1950. The commission on cartography of the institute had representatives from most of the American nations and continued its progress in inter-American co-ordination of mapping.

The International Geographical union established a committee at its Lisbon, Port., meeting in 1949 for the preparation of a world land-use map. The committee, headed by S. Van Valkenburg with members from France, England, Brazil, Switzerland and the United States, met at Clark university, Worcester, Mass., early in 1950 to implement the plan for the map. The committee adopted a scale of 1:1,000,000 for the map base and proposed nine basic units to be shown by colour and pattern in depicting land use. Memoirs explaining land use in detail were planned to accompany the maps. (See also COAST AND GEODETIC SURVEY, U.S.; ELECTRONICS; GEOGRAPHY; NATIONAL GEOGRAPHIC SOCIETY.)

**Cement.** World production of cement advanced from 111,223,000 short tons in 1948 to 124,656,000 tons in 1949, a rise of 12%. This was about a 22% increase over the pre-war level, and more than double the 1945 war low. The United States is the largest producer, with about one-third of the total—almost as much as the whole of Europe.

**United States.**—The salient features of the cement industry in the United States were reported by the U.S. bureau of mines as follows:

**Cement Industry in the U.S.**

(Millions of barrels)

	1942	1943	1944	1945	1946	1947	1948	1949

In 1949 both output and shipments made new record highs, advancing the 1948 records by 2%, and there was a small surplus to add to stocks. In the first three quarters of 1950, production of portland cement increased to 155,786,000 bbl. and shipments to 171,353,000 bbl., as compared with 155,786,000 bbl. and 164,232,000 bbl. in the same period of 1949.

These figures indicated new record highs in production and shipments for the year.

**Canada.**—Production increased from 14,127,123 bbl. in 1948 to 16,009,019 bbl. in 1949 and 9,726,560 bbl. through July 1950.

(G. A. Ro.)

**Census Data, U. S.** The decennial census was established by the constitution of the United States as a means for putting into effect one of the compromises of the newly established government, namely, the granting to the larger states of a representation in the house of representatives proportional to their population, while all states, without regard to size, had equal representation (two members) in the senate.

The first U.S. census, taken in 1790, canvassed the territory now occupied by 18 states and showed a total population of a little less than 4,000,000. On the basis of this census 105 representatives were apportioned among the 13 states then organized, there being an average of one representative for each 34,436 persons in the apportionment population. The apportionment population of the United States since 1930 has been the total population of continental United States excluding only the population of the District of Columbia, though in earlier years, in accordance with specifications set forth in the constitution, there were deducted also two-fifths of the number of slaves, the number of Indians not taxed, and the population of territories within the area of continental U.S.

This first census recorded for each household the number of persons in each of five categories, namely, free white males under 16 years of age, free white males 16 and over, free white females, free persons other than white, and slaves. Subsequent censuses increased the number of categories somewhat, but still required only a count for each household; and it was not until 1850 that the census taker recorded information for each indi-

vidual person. From that time on, the census schedules (lists of questions) became increasingly complex, until in 1950, in the 17th census, there were 18 questions to be asked (so far as they applied) about each person, 27 additional questions to be asked of a random sample (mostly 20%) of the persons enumerated, and 31 questions (9 on a sample basis) with regard to the dwelling occupied by each family or household. Even these figures do not constitute a full measure of the complexity of the enumerator's task, since for each farm operator there was also a farm schedule containing 332 questions, of which perhaps no more than 60 or 70, however, might require answers on any one farm.

While these large numbers of census questions provided literally acres of published statistics, giving detailed classifications and cross-classifications, requests for simple and purely quantitative data, such as the total population of specified areas on specified dates, were still more frequent (though possibly not more important) than any other type of inquiry received by the bureau of the census.

The final figures for the 1950 population of states became available early in Nov. 1950, or nearly a month in advance of the date on which they were required by law, and the final figures representing the population of counties and cities were expected to become available state by state during the first seven or eight months of the year 1951, along with detailed tabulations giving various classifications of the population by such characteristics as colour, sex, age, marital status, education, employment, etc. In order to give information with regard to the various characteristics of the population of the United States at the earliest possible date, a random sample of 150,000 persons was selected and tabulated. The tabulations included figures not only for the United States as a whole, but also for the four regions and the ten largest states, namely, New York, California, Pennsylvania, Illinois, Ohio, Texas, Michigan, New Jersey, Massachusetts and North Carolina. Some of the data from this sample tabulation are presented below in Tables X, XI and XII, while in Tables XIII to XVI are presented figures based on the current monthly sample

"FROM FIFTH TO SECOND," a 1950 cartoon by Pratt of the McClatchy Newspapers

survey. Though these samples are fairly adequate, especially with respect to United States totals, it should be borne in mind that the sample-based figures are all subject to a moderate sampling variability which increases with the decrease in the size of the figures concerned, and that small differences between one figure and another are even more seriously affected by this variability.

**Population Growth.**—The population of the United States on April 1, 1950, the date of the 17th decennial census, was 150,697,361, as compared with 131,699,275 on April 1, 1940, the date of the 16th census. The increase in population in the decade ending in 1950 thus amounted to 19,028,086 persons, or 14.5% of the 1940 population. Numerically, this was the largest increase attained in any census decade, though the percentage increase was smaller than that recorded in any earlier 10-year period except the period of the depression, between 1930 and 1940, during which the population increased only 7.2%.

The population in 1790, when the first census was taken, was only 3,929,214. Each subsequent census up to 1860 showed an increase of about one-third over the preceding one; from 1860 to 1910 the decennial increase was around 20% or 25%; for the next two decades, around 15% or 16%; and for the decade ending in 1940, only 7.2%, as indicated above. The much more rapid growth which took place between 1940 and 1950 represented, therefore, a reversal of a long-time trend toward slower and slower population growth. The data from the 17 censuses are presented in Table I.

Table I.—Population and Area of Continental United States, 1790–1950

Census year	Population	Increase over preceding census		Land area in square miles	Population per square mile
		Number	Per cent

\*Revised figure, including estimate for underenumeration in southern states.

**Annual Estimates.**—Monthly estimates of the population of the United States had been made since 1940 by adding each month the number of births, subtracting the number of deaths (including an allowance for underregistration of births and deaths), and adding the net immigration. The estimates for July 1 of each year, as presented in Table II, together with the three elements on which they were based, indicate significant changes in the rate of population growth within the decade as well as the (unexpected) increase in the decade taken as a unit, in comparison with previous decades.

During the decade 1930 to 1940 the average annual increase in the population of the United States was less than 900,000. Even in the first year of the decade of the 1940s the increase was materially higher than this average, being 1,233,000, with further increases to a wartime maximum of 1,832,000 in the year ending June 30, 1943. These increases resulted mainly from the increased numbers of births which were stimulated by increasing prosperity (in con-

trast at least with the depression atmosphere of most of the 1930s), and by defense and early war conditions.

For the next three years the annual increase was maintained at approximately 1,500,000 or 1,600,000, with a new all-time record of 2,789,000 set in fiscal year 1947, the first full year after demobilization.

In the three remaining years of the decade the annual increase was maintained only a little below this maximum; and population experts, many of whom had regarded the large number of births which took place in 1947 as a temporary matter, a sort of aftermath of demobilization, were uncertain as to whether to look forward to a long-time continuance of the high birth rate or to expect shortly a return to the pre-World War II trend toward lower rates of increase.

Official forecasts even for a date so little distant as 1955 ranged from a minimum of 157,738,000, which would involve a drastic reduction in the number of births, to a maximum of 165,541,000, which would involve an average population increase a little above the level which had been maintained during the four years from 1947 to 1950.

The sources of the increase between July 1, 1949, and July 1, 1950, may be summarized as follows: there were during this 12-mo. period 3,703,000 births, from which were subtracted 1,467,000 deaths, leaving a natural increase of 2,236,000; and the net civilian immigration amounted to 320,000.

The immigration figure, it may be noted, had increased rather rapidly during the decade, rising from around 60,000 in 1941 and 1942 to 230,000 in fiscal year 1947 and to figures materially above 300,000 in each of the remaining years of the decade. (See also IMMIGRATION AND EMIGRATION.)

The estimates given in Table II represent the population of the United States including persons in military service overseas, these being the figures in widest demand and those most appropriately computed by the method outlined. Estimates have been made also on two other bases, namely, the population actually present in continental United States, that is, excluding military overseas, which is the population that would be counted in a census; and finally the civilian population, excluding all persons in military service, which is the most appropriate base for the monthly estimates of employment and labour-force participation which have likewise been provided since 1940.

To make clear the interrelations between one and another of these estimates a brief summary of the three series is presented in Table III.

The differences between one series and another depend largely on the military situation, as one might expect. Both in 1940 and again in 1950 (July 1) the differences were small. There were much larger differences in 1943 and especially in 1945, which was the year of maximum numbers in the armed forces, both in the United States and overseas.

**Births and Deaths.**—While emphasis has been put on the recent increases in the birth rate in the foregoing discussions of population increase, the fact that there were also significant,

\*Estimated total, including adjustment for underregistration.

though much slower, changes in the death rate ought not to be overlooked. While the birth rate (based on estimated total births, not registered births alone) declined from a recent maximum of

1948. For white females the figures were 53.6 in 1910, 62.7 in 1930 and 71.0 in 1948.

For nonwhite males the 1948 expectation of life was 58.1 and for nonwhite females, 62.5.

**Population by States.**—The population in 1950 and 1940 is shown by regions, divisions and states in Table V, with the amount of increase between 1940 and 1950 and the percentage of increase both for this decade and for the preceding one. The accompany-

Table III.—Three Types of Estimates of the Population of the United States, 1940–50

Date	Total population including armed forces overseas	Population resident in the U.S.*	Civilian population
July 1, 1940 . . . . .	131,970,000	131,954,000	131,659,000

July 1, 1950 . . . . .	151,772,000	151,376,000	150,457,000

1950 by months:			
January . . . . .	150,604,000	150,161,000	149,196,000
February . . . . .	150,808,000	150,388,000	149,442,000
March . . . . .	150,998,000	150,588,000	149,653,000
April . . . . .	151,188,000	150,778,000	149,859,000
May . . . . .	151,358,000	150,953,000	150,037,000
June . . . . .	151,553,000	151,159,000	150,242,000
July . . . . .	151,772,000	151,376,000	150,457,000
August . . . . .	152,016,000	151,562,000	150,679,000
September . . . . .	152,271,000	151,695,000	150,817,000

\*This is the estimate which has the same coverage as the decennial census. The series of estimates had not been revised to eliminate the small difference between the estimate for April 1, 1950, and the census.

28.1 per 1,000 of the population in 1921 to an all-time low of 18.4 in 1933 and 1936, the death rate declined from 13.5 in 1920, with annual fluctuations of usually no more than 0.5, to 9.7 in 1949 and 1950. The effect of this decline in the death rate on population increase may be illustrated by computing the number of deaths that would have taken place in 1950 if the 1920 death rate had been maintained. This figure would amount to 2,044,000, in comparison with an actual 1,467,000, and would leave a natural increase of only 1,659,000, which in turn would reduce the population increase in 1950 to less than 2,000,000 or 20% less than the actual increase.

The data on births and deaths for the period from 1920 to 1950 are presented in Table IV.

Table IV.—Births and Deaths in the United States, 1920–50\*

Calendar year	Births, estimated total	Deaths, estimated total	Excess of births over deaths	Rate per 1,000 of the population		
				Births	Deaths	Excess of Births
1920 . . . . .	2,950,000	1,442,000	1,508,000	27.7	13.5	14.2

1950 . . . . .	3,703,000	1,467,000	2,236,000	24.4	9.7	14.7

\*Figures represent estimated totals, including adjustment for underregistration and, for years prior to 1933, estimates for states outside the registration area. Rates are based on estimated total numbers of births and deaths, not, as usually heretofore, on registered births and deaths alone.

†Maximum rate since 1920.

‡All-time minimum rate.

The decreasing death rate reflects the increasing length of life in the United States—though perhaps it does not express this change as emphatically as the figures for life expectation or average length of life. The life expectation for white males had increased from 50.2 years in 1910 to 59.1 in 1930 and to 65.6 in

Table V.—Population of the United States by Regions, Divisions and States, 1950 and 1940

\*A minus sign (—) denotes decrease.

Left: CENSUS TAKERS leaving the Federal building in New York city, headquarters of the 1950 count of population in the nation's largest city. Interviews were designed to require less than two minutes each

Above: ONE OF THE 141,000 enumerators who gathered 1950 data on U.S. housing, vital statistics, ownership of television sets and other facts, in the 17th of a series of counts required by the U.S. constitution

Left: SEMINOLE INTERPRETER (second right) assisting a federal census enumerator assigned to the Everglades region of Florida during the 1950 tally

Right: WIDELY PUBLICIZED PHOTO of one of the hazards of census taking in 1950. The newspaperwoman in the picture was accompanying an enumerator sent to interview coast guardsmen at a lighthouse off the Florida coast. At the landing, a sudden wave upset her footing and she received an unexpected dunking

ing map shows in graphic fashion the extent of the increase in each state.

Most prominent among the states in the matter of population increase was California, whose population increased from 6,907,387 in 1940 to 10,586,223 in 1950, the increase amounting to 3,678,836, or 53.3%. As a result of this spectacular increase California ranked second in population in 1950, whereas in 1940 it ranked fifth. The ten states with the largest population in 1950 were as follows:

1. New York . . . . 14,830,192
2. California . . . . 10,586,223
3. Pennsylvania . . . 10,498,012
4. Illinois . . . . . 8,712,376
5. Ohio . . . . . 7,946,627
6. Texas . . . . . 7,711,194
7. Michigan . . . . . 6,371,766
8. New Jersey . . . . 4,835,329
9. Massachusetts . . . 4,690,514
10. North Carolina . . 4,061,929

There were four states besides California in which the population increase amounted to more than 1,000,000 namely, New York, Texas, Michigan and Ohio. Florida, with 46.1%, was the only state outside the west to show a percentage increase above 28.6%, while the District of Columbia, which headed the list in relative increase between 1930 and 1940, gained only 21.0% in the later decade.

In four states the population was smaller in 1950 than in 1940, though the rates of decrease were low: 0.2% in Mississippi, 2.0% in Arkansas, 3.5% in North Dakota and 4.4% in Oklahoma.

The rates of increase shown for groups of states, that is, for regions and geographic divisions, are perhaps more significant than those for individual states, possibly excepting California and Florida, where the winter climate seems to attract in-migrants, entirely without regard to changing economic conditions in various parts of the country. The lowest rate of increase (4.0%) among the divisions was recorded for the west north central division. This is an area mainly agricultural, which includes a part of the Dust Bowl where agriculture had not been too prosperous. The next lowest rate (6.5%) was for the east south central division, another farming area, though with rapidly growing manufacturing centres; and the next (9.5%) for the middle Atlantic division which is primarily a manufacturing area. It is difficult, then, to establish any relation between the domi-

nance of agriculture or manufacturing and the trend of population increase. The only divisions having a rate of increase in excess of the weighted average represented by the rate for the U.S. as a whole (14.5%) were the south Atlantic with 18.8%, the mountain with 22.3% and the Pacific with (thanks to California) 48.8%.

Especially in view of the possibility of statehood for Alaska and Hawaii, it is of interest to consider the 1950 population of the various territories and possessions of the U.S. These data are presented, with comparative figures for 1940 and 1930, in Table VI.

Table VI.—Population of Territories and Outlying Possessions, 1930-50

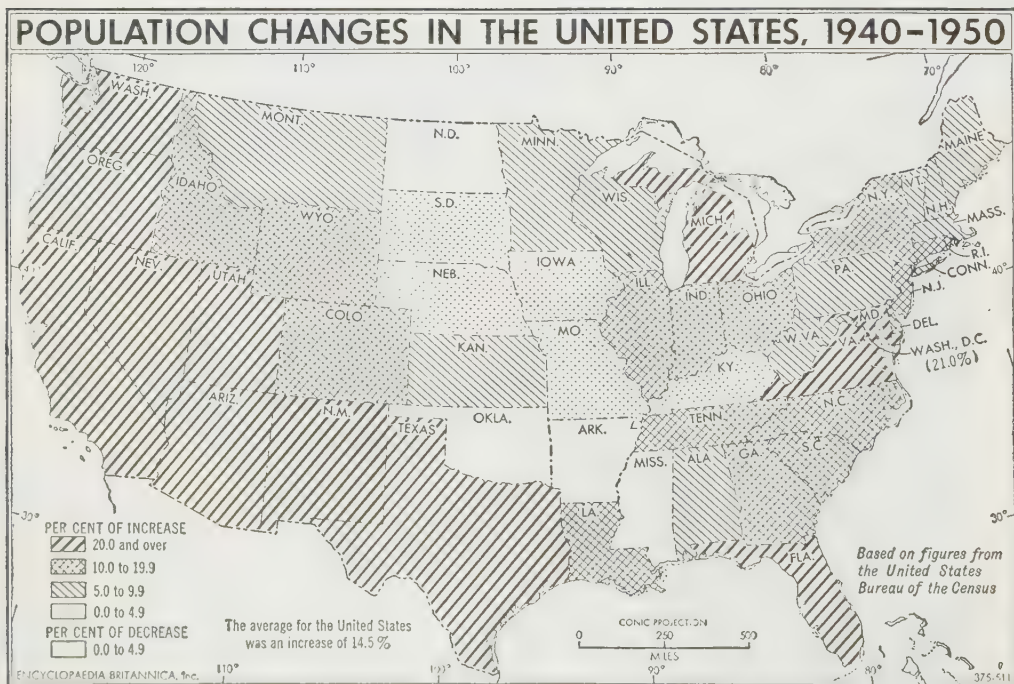

Area	Population			Per cent of increase		Area in square miles	Population per sq. mi., 1950
	1950*	1940	1930	1940-50	1930-40		
Alaska . . . . .	128,643	72,524	59,278	77.4	22.3	571,065	0.2
American Samoa . . . . .	18,602	12,908	10,055	44.1	28.4	76	244.8
Guam . . . . .	58,754	22,290	18,509	163.6	20.4	203	289.4
Hawaii . . . . .	499,794	423,330	368,336	18.1	14.9	6,420	77.9
Panama Canal Zone	52,300	51,827	39,467	0.9	31.3	362	144.5
Puerto Rico . . . . .	2,210,703	1,869,255	1,543,913	18.3	21.1	3,423	645.8
Virgin Islands of the United States	26,654	24,889	22,012	7.1	13.1	132	201.9

\*The 1950 figures for American Samoa, Guam, Panama Canal Zone and the Virgin Islands are preliminary.

By far the largest of the outlying areas now under the jurisdiction of the U.S. is Puerto Rico with a 1950 population of 2,210,703 and a current rate of increase of nearly 2% a year. Puerto Rico has not been set up as an organized territory, however, partly because of its current economic dependence on the U.S. government and partly without doubt by reason of language differences (Spanish being still the dominant language in Puerto Rico), though similar differences did not prevent the province of Quebec (with its dominant French language) from being an integral part of Canada.

The population of Hawaii increased from 423,330 in 1940 to 499,794 in 1950, or 18.1%, indicating a rate of natural increase not much different from that prevailing in Puerto Rico. The population of Alaska increased from 72,524 in Oct. 1939 to 128,643 in April 1950, or 77.4%, mainly by reason of the expansion of military operations, though the change in the census date from October to April brought into the scope of the census considerable numbers of temporary workers who come to Alaska each year for the canning season and later return to the states.

Populationwise. Hawaii is larger than Nevada, Delaware, Vermont or (by a slight margin) Arizona, and the general pattern of its social and economic activities is not so far different from that prevailing in some states on the mainland. But Alaska, with even fewer people than Nevada (128,643 as compared with 160,083), and with nearly one-third of these comprising persons of native stock living for the most part outside the conventional commercial and industrial system, and another third comprising temporary residents not likely to remain in the territory for more than a few months in any one year or men in the military service of the U.S., can hardly make as good a showing as this.

The other possessions are relatively unimportant as regards population, but each has its own importance in what might be termed international relations.

**Apportionment.**—One of the most important functions of the decennial census—perhaps still the most important single function—is that of providing a basis for the reapportionment of representation in the house of representatives in accordance with the changing distribution of the population. Prior to 1920 such a reapportionment was made by congress following each census. No reapportionment was made on the basis of the 1920 census; and in the act providing for the 1930 and subsequent censuses (under which the censuses of 1940 and 1950 were taken) provision was made that if congress did not legislate otherwise within a specified time reapportionment on the basis of the new census should go into effect without specific legislation. This law, as amended, required that the president submit to congress at the first session of the congress assembling after the census date, a statement showing the new population of each state and the number of representatives to which each state is entitled on the basis of these figures, under the method of apportionment known as "equal proportions"—a method which makes the relative difference between one state and another in the population per

Table VIII.—Population in Groups of Urban Places Classified by Size, 1950 and 1940

Size group	Number of places		Population

California . . . . .	30	+7	352,874	23	-7	300,321	32	+9	

representative the least that is possible. The computation of this distribution is much more complicated than the simple division of the population of each state by a new average per representative, computed on the basis of the new census totals. Since it is not possible for a state to have a fraction of a representative, the method must allocate representatives for some of the fractions and disregard other fractions altogether in such fashion that the difference between the average population per representative, in the case of those states where the competition is closest, is less than it would be under any different apportionment.

The new apportionment, as computed for a house of 435 members, is presented in Table VII, with the gain or loss from the former allotment of representatives and the average population per representative. The 1940 apportionment and its averages are also included as background for comparison. Since it had been proposed, as early as Dec. 1950, that the membership of the house be increased to 450, an apportionment of this number with corresponding gains or losses is also presented—though there was no very stable basis for opinion at the close of the year 1950 as to what action, if any, would be taken.

By way of comment on the proposal just mentioned, it may be noted that California would get 2 of the 15 additional representatives and that even with 15 added to the house membership, five states would lose 1 representative each. If the membership of the house was not changed, California would gain seven members by virtue of its extensive population increase; Florida would gain two members; Michigan, Maryland, Virginia, Texas and Washington would gain one each; Pennsylvania would lose three members; New York, Missouri and Oklahoma would lose two each; and the following states would lose one each: Illinois, Kentucky, Tennessee, Mississippi and Arkansas.

**Population of Cities.**—In 1950 there were in the U.S. 4,270 places having a population of 2,500 or more, including 397 unincorporated places for most of which official census figures would be shown for the first time in the 1950 census reports.

Both the presentation of census data and the classification of places of requisite size as urban were formerly limited to incorporated places since these places have definite boundaries, set up as a part of the requirement for incorporation. For the 397 unincorporated places referred to above (and for a much larger number of unincorporated places having a population between 1,000 and 2,500) arbitrary boundaries were established by the census bureau in advance of the 1950 enumeration. The numbers

of places in significant size-groups in 1950 and in 1940, with the population represented by each group, are presented in Table VIII.

The number of cities in the U.S. having 1,000,000 inhabitants or more remained unchanged, there being five such cities in 1950 as in 1940, but there were considerable increases in most of the other groups. The number of places having a population of 50,000 or more increased from 199 in 1940 to 231 in 1950; the number with a population of 25,000 or more increased from 412 to 427; and the number with 10,000 or more increased from 1,077 to 1,257, the latter figure including 29 of the newly counted unincorporated places, while the whole number of urban places—those with 2,500 inhabitants or more—increased from 3,464 to 4,270, including 397 unincorporated places.

According to the preliminary figures there were 106 cities with a population of 100,000 or more in 1950, as compared with 92 such cities in 1940. There were 15 cities whose population increased between 1940 and 1950 from something less than 100,000 to something more than that number. One city, Lowell, Mass., dropped out of the list by reason of decrease in population. Of the 15 cities which appeared on the list for the first time in 1950, 9 were in the south, 3 in the west, 2 in the northeast and only 1 in the north central region. Data for the 106 cities are presented in Table IX.

Table IX.—Population of Cities of 100,000 or More, 1950 (Preliminary Count) and 1940

City	1950, preliminary	1940	Increase,* 1940-50	Per cent of increase*	
Total, 106 cities	43,954,910	39,128,471	4,826,439	12.3	5.2

\*A minus sign (—) denotes decrease.

There were a number of changes between 1940 and 1950 in the ranking of the leading cities with respect to population. The three cities standing at the head of the list, New York, N.Y., Chicago, Ill., and Philadelphia, Pa., ranked first, second and third, respectively, both in 1940 and in 1950. St. Louis, Mo., also retained its rank as eighth, but Los Angeles, Calif., replaced Detroit, Mich., as the fourth largest city, Baltimore, Md., replaced Cleveland, O., as sixth, Washington, D.C., replaced Boston, Mass., in the ninth position, and Pittsburgh, Pa., which was tenth in 1940, ranked 12th in 1950, while San Francisco, Calif., which was 12th in 1940 became 11th in 1950.

In the matter of absolute increase, there were 12 cities which added more than 100,000 to their population between 1940 and 1950, including 3 for which this addition represented a relative increase of more than 54%, namely, San Antonio, Tex., San Diego, Calif., and Houston, Tex. Some of the smaller cities likewise registered increases of more than 50%; and one of the new cities on the list, Baton Rouge, La., increased from 34,719 to 123,957, or 257.0%.

The increase between 1940 and 1950 in the population of the 106 cities taken together amounted to 12.3% as compared with 5.2% in the same cities between 1930 and 1940. Most of the individual cities increased in population more rapidly between 1940 and 1950 than in the preceding decade, though there were a few exceptions. For example, among the cities of more than 150,000 in 1950 which registered a decline in rate of growth were Minneapolis, Minn., Atlanta, Ga., Providence, R.I., Miami, Fla.,

Jacksonville, Fla., and Des Moines, Ia. New York and Washington, D.C., also showed materially lower rates of increase in the more recent decade, mainly, perhaps, because of trends toward suburban residence.

The population of all cities and other urban places of 5,000 or more, arranged alphabetically by states, is shown for 1950 and 1940 in Table XVII at the end of this article.

**Urban and Rural.**—From 1910 to 1940 the urban population of the U.S. was defined substantially as the population living in incorporated places of 2,500 or more. This definition left out of the count the population living in the larger unincorporated places and much of the population living in the suburbs of the larger cities. To bring into the urban classification these two fairly large groups of population, two changes were made in the definition adopted for the 1950 census. First, the suburban areas around all cities of 50,000 or more were carefully mapped and boundaries were established for an area termed the "urban fringe." This included, of course, some incorporated places already classified as urban in their own right, but it also covered many thickly settled suburban areas previously classified as rural. Second, arbitrary boundaries were established for a large number of unincorporated villages so that separate counts could be made for these places and they could be classified as urban if they had 2,500 inhabitants or more, without regard to the fact that they were not incorporated. The 1950 data available for this article were based mainly on the preliminary count of the population of the constituent places, as presented in Tables VIII and IX, just preceding, though it was not expected that the final figures would make any material change in the urban-rural classification. A summary of the urban and rural data is presented in Table X, in which final totals for urban and rural population were estimated by distributing between the two classes the small margin between the preliminary population of the U.S. and the final figures which were established for the U.S. and for states. The table presents not only the 1950 urban population based on the new method of classification outlined above, but also a 1950 urban total obtained by applying the 1940 rules to the 1950 census returns. This last figure makes possible direct comparisons with 1940.

Table X.—Urban and Rural Population of the United States, 1950\* and 1940

Item	1950 population 1950 method	1940 method	1940 population	Per cent of in- crease*
Total population, final . .	150,697,361	150,697,361	131,669,275	14.5
Urban, final (estimated†) . .	96,430,181	88,866,106	74,423,702	19.4
Rural, final (estimated‡) . .	54,267,180	61,831,255	57,245,573	6.8
Per cent urban . . . . .	64.0	59.0	56.5	—

\*A new method of classifying population as urban was adopted in 1950; figures for 1950 are shown in this table both for the new method and for the 1940 method, thus providing data comparable with 1940.

†Per cent of increase over 1940 represented by the 1950 urban and rural population as classified by the 1940 method.

‡Estimates for 1950 based on the assumption that the percentage urban in the final population will be the same as in the preliminary.

On the basis of the comparable figures (using the 1950 urban based on the 1940 method), it may be noted that the urban population increased by 19.4% in the decade ending in 1950, and the rural by 6.8%, whereas during the decade ending in 1940 the urban increase amounted to 7.9% and the rural to 6.4%. It appeared from these 1940 figures that the pattern of much more rapid increase in urban areas, which had been typical of the decades prior to 1930, might have been changed, perhaps permanently, after the same fashion as the pattern of general population increase. The percentage of urban increase between 1940 and 1950, however, was almost three times the percentage of rural increase—which might (or might not) indicate that the older pattern had been re-established.

The estimated total urban population in 1950 on the new basis was 96,430,181, as compared with 88,866,106 on the old basis, the effect of the change in definition or method of classification being to add 7,564,075 to the urban group, while the decade's increase on the old basis was 14,442,404. The preliminary urban total was 95,891,539, which figure was made up of the population of the urban places recorded in Table VIII, namely, 87,992,647, and that part of the urban-fringe population not already counted as urban because it was made up of incorporated places of 2,500 or more, which amounted to 7,898,881.

The percentage urban in the total population, which increased only from 56.2 to 56.5 between 1930 and 1940, had increased to 56.5 in 1950 using the 1940 definition of urban; and was further increased to 64.0 by the more inclusive definition established for 1950.

**Sex Distribution.**—The sex ratio, that is the number of males per 100 females in the total population, was 100.7 in 1940, and the number of males exceeded the number of females by 453,909. At some time between 1940 and 1950 the number of females in the population passed the number of males and began to build up an excess, which by 1950 amounted to at least 600,000 or 700,000 on a basis comparable with 1940.

**Colour and Nativity.**—The proportions of the population white and nonwhite remained practically the same in 1950 as in 1940, 89.7% of the 1950 population being classified as white and 10.3% as nonwhite. Between 1940 and 1950 the white population increased from 118,214,870 to 135,215,000, or 14.4% while the nonwhite population, mainly Negro, increased from 13,454,405 to 15,482,000, or 15.1%. It may be noted, however, that the native white population alone increased 17.1%, while the foreign-born white population decreased from 11,419,138 to 10,147,000, or 11.1%. As a basis for estimating probable future trends in the white-nonwhite relationship, it may be better to compare with the 14.1% increase in the nonwhite population the 17.1% increase in the native white population, rather than the figure for total white population. The foreign-born white population had been decreasing since 1930, and the average age of the 10,437,000 foreign born enumerated in 1950 was very high, and its death rate correspondingly high. If, however, immigration should be maintained at the level of the annual average for the last half of the decade ending in 1950, it might be sufficient to offset the rather large number of deaths bound to occur in the foreign-born white population.

The data on population classified by colour and nativity for 1950 and 1940 are presented, by regions, in Table XI.

While the percentage of nonwhites in the population of the U.S. as a whole remained practically unchanged between 1940 and 1950, there was an increase in the western division from 3.8% to 4.8%, there being an increase in the number of Negroes alone in that division from 170,706 in 1940 to 576,000 in 1950, partly offset by a slight decline in the number of other nonwhites.

In the south, where two-thirds of the nonwhite population is located, there was a decline in the percentage nonwhite in the total population from 24.0 to 21.9. This change resulted from the migration of Negroes from southern farming areas to northern and western manufacturing centres, as evidenced by significant increases in the proportions nonwhite in both the northeastern and the north central regions, as well as in the west.

**Age Distribution.**—The general level of the age of the population of the U.S. had been steadily increasing for a long time. The median age in 1950 was 30.1 years, as compared with 29.0 in 1940, 26.4 in 1930 and 16.7 in 1920, the earliest date for which age data for the entire population are available. Between 1940 and 1950, however, there were important changes in the opposite direction as a result of the much higher birth rates which prevailed, especially during the latter part of that decade, though

and over increased from 6.9 to 8.2.

**Employment Status.**—Estimates of the number of persons in the civilian labour force, the number employed, the number unemployed, etc., based on a series of sample surveys, have been published each month since 1940. For the purpose of these statistics a person who did any work for pay or profit during the week preceding the inquiry, or who had a job from which he was temporarily absent, was counted as employed; and a person who was seeking work, using the word seeking in a rather broad sense, was counted as unemployed. The employed and unemployed, taken together, constituted the labour force. These figures are summarized for the month of November in 1950 and 1949 in Table XIII.

Table XIII.—Employment Status of the Population of the United States,\* Nov. 1950 and Nov. 1949

Employment status	Nov. 5-11, 1950	Nov. 6-12, 1949	Increase†

\*Figures based on a small sample.  
†A minus sign (—) denotes decrease.

The civilian labour force increased from 62,927,000 in Nov. 1949 to 63,512,000 in Nov. 1950. This increase of 585,000, plus an increase of more than 500,000 in the armed forces, was less than 100,000 short of the increase in the total population 14 years old and over. The number of persons employed increased from 59,518,000 to 61,271,000, or 2.9%, while the number of unemployed decreased from 3,409,000 to 2,240,000, or 34.3%.

The changes in the several elements in the labour force for the entire period from 1940 to Nov. 1950 are presented in graphic form in the chart on p. 159.

The more significant items of the labour-force classification are presented by months from July 1949 to Nov. 1950 in Table XIV, which provides data for evaluating rather important short-time changes.

†Total non-institutional population 14 years old and over.

The labour-force participation, that is the proportion of the population 14 years old and over (omitting institutions) which was in the labour force, ranged, during the period covered by

TRENDS in the labour force, 1940 to 1950 (Source: U.S. Bureau of the Census)

Table XIV, from a minimum of 51.6% in Jan. and Feb. 1950 to a maximum of 56.2% in Aug. 1950. Two important factors contributed to this variation: first, a much larger proportion of the members of farm families were actually at work on the farms in the summer months than in midwinter; and second, large numbers of students entered the labour force in quest of temporary jobs for the school vacation period.

The number of persons actually employed is also materially affected by these seasonal changes, though employment increased during the period under discussion somewhat more rapidly than the number of persons in the labour force, reaching a maximum of 62,367,000 in Aug. 1950. The unemployment figures are perhaps a better—or at least a simpler—index of changes in labour market conditions. The number of unemployed reached a postwar maximum of 4,684,000, or 7.6% of the labour force, in Feb. 1950, from which point it declined rather rapidly to a minimum of 1,940,000 in October, with a slight increase to 2,240,000 in Nov. 1950.

Between Nov. and Dec. 1950, the number of workers employed in agriculture declined from 7,551,000 to 6,234,000, a decrease of 1,317,000, only partly offset by an increase of 354,000 in non-agricultural employment. The number of unemployed declined slightly, from 2,240,000 in November to 2,229,000 in December. The average number of persons employed during the year 1950 was 60,000,000, however, as compared with an average of 58,700,000 in 1949.

\*Figures based on a small sample.

Because a large part of the seasonal variation in employment takes place in agriculture, figures are presented in Table XV showing separately by months, from Nov. 1949 to Nov. 1950, employment in agricultural and in nonagricultural industries.

These figures indicate a decline in agricultural employment from 7,878,000 in November to 6,198,000 in January, followed by a rather rapid increase to 9,046,000 in June. From this point there was a gradual decline to 7,811,000 in September, with a temporary increase to 8,491,000 in October (resulting from unusual seasonal conditions), and then a figure for Nov. 1950 of 7,551,000 which was a little lower than in Nov. 1949.

Employment in nonagricultural industries was much less affected by seasonal conditions, though there was a period from January to March where this type of employment was somewhat below 52,000,000. From April to August there was fairly rapid increase to a maximum (for the year) of 54,207,000, followed by lower figures for September, October and November. Employment in nonagricultural industries formed 89.1% of the total employment in January and February, but only 85.3% in June and 87.7% in November.

While the net change in employment or unemployment between one month and another is usually not very great, the number of persons who change from a status of employment to a status of unemployment or vice versa is much larger. For example, between October and November of 1950, as shown in Table XIV, employment declined from 61,764,000 to 61,271,000 or by 493,000, and unemployment increased slightly from 1,940,000 to 2,240,000 (or by 300,000).

During the same time, however, more than 3,000,000 persons came into the employment status, and more than 3,500,000 passed out of it. These figures are presented in some detail, by sex, in Table XVI.

Table XVI.—Gross Changes in Employment between October and November, 1950, by Type of Change and Sex

Transfers between agricultural and non-agricultural industries: . . . . .	—	—	—	—	—	—
From agricultural in October to nonagricultural in November . . . . .	521	—	412	—	109	—
From nonagricultural in October to agricultural in November . . . . .	231	—	190	—	41	—

Of the 3,091,000 persons who became employed between the week ending Oct. 14 and the week ending Nov. 11, 647,000 were unemployed at the time of the survey in October and 2,444,000 were outside the labour force—that is, neither working nor seeking work.

Of this number the larger part (1,439,000) were women engaged in home housework.

On the other hand, of the 3,582,000 persons who were employed in October but not in November 763,000 had become unemployed (but were still seeking work) and 2,819,000 had passed out of the labour force altogether and were not even looking for work. About half of this total, likewise, were women who had returned to their household activities, though considerable numbers

of both men and women (659,000) had given up gainful work for school.

In addition to these extensive transfers between labour-force status and status outside the labour force, there were transfers from agriculture in October to nonagriculture in November amounting to 521,000, partly offset by transfers in the reverse direction amounting to 231,000.

**Places of 5,000 or More.**—Table XVII gives the 1950 population for all places of 5,000 or more, including unincorporated places as well as incorporated, arranged by states. The 1950 figures are the result of a preliminary count of the population and are subject to later revision—for the most part a slight revision upward. (See also ALIENS; BIRTH STATISTICS; CARTOGRAPHY; EMPLOYMENT; HOUSING; MARRIAGE AND DIVORCE; WAGES AND HOURS; WEALTH AND INCOME, DISTRIBUTION OF.)

(L. E. T.)

Table XVII.—Population of Cities and Other Urban Places of 5,000 or More, by States

(The 1950 figures represent a preliminary count of the population, subject to later revision)

**Ceylon.** A self-governing member of the British Commonwealth of Nations, lying off the southern extremity of India and approaching to within 6° N. of the equator, Ceylon has an area of 25,332 sq.mi. Pop. (1946 census) 6,693,945, (mid-1950 est.) 7,500,000. Language: mainly Sinhalese (69%) and Tamil (21%). Religion: Buddhist (61%), Hindu (22%), Moslem (9%) and Christian, mainly Roman Catholic (7%). Chief towns (pop. 1946 census): Colombo (cap. 362,000); Jaffna (63,000); Dehiwala-Mt. Lavinia (56,000); Kandy (52,000). Ruler, King George VI; governor general, Lord Soulbury; prime minister, Don Stephen Senanayake.

**History.**—At the opening of the year 1950 the government of Ceylon announced its decision to recognize the Chinese Communist government at Peking. This decision, according closely with the policy of the United Kingdom and India, was not unexpected. The prime minister thus strengthened himself against the criticisms of the opposition, the largest party of which consisted of Communists.

The finance minister, J. R. Jayawardene, presented the budget on July 20. Changes in taxation included an additional 15 cents per pound on the export duty on both rubber and tea, bringing the total export duty on tea to 53 cents per pound; the export duty on pepper was increased by Rs. 2 per pound. This was designed to meet the extra subsidies on rice and flour and curb inflationary pressure resulting from high prices on tea, rubber and coconut produce. On the other hand customs duty was reduced on a wide range of consumer goods. In regard to income tax the limit of exemption was raised, thus relieving 35,000 people from taxation, and the basic unit rate of income tax was raised from 8.5% to 9%. The supertax on larger incomes was slightly increased and the companies tax was raised from 25% to 27%.

The economy of the island was dangerously dependent on the fluctuation of world prices over a limited range of commodities—tea, rubber and coconut accounting for 90% of the total exports of the island. The government's program to increase economic stability included proposals for increasing food production and

JAWAHARLAL NEHRU at a press conference in Colombo, Ceylon, between sessions of the British Commonwealth of Nations meetings held there in Jan. 1950; talks were devoted mainly to Commonwealth support of southeast Asia in its struggle against communism

devising other forms of employment. Plans were framed for spending £102,000,000 on development, according 37% of the sum to agriculture, 22% to transport and communications, 27% to social services, 8% to power and 6% to industry.

The balance of payments in 1950 was expected to show an estimated surplus of Rs. 100,000,000—a definite improvement on the Rs. 28,000,000 deficit of 1949; but it was obvious that the avoidance of deficits in future years would be a matter of extreme difficulty and dependent on unpredictable factors.

**The Colombo Plan.**—In 1950 Colombo was the scene of an important conference of the Commonwealth countries' foreign ministers to discuss the economic development of south and south-east Asia in the maintenance of the political stability of that area. This Colombo conference brought into existence the Commonwealth Consultative committee, which met at Sydney, Austr., in May. As a result a plan was drawn up for a six-year period to run from the middle of 1951 to carry out the objects of the committee's proposals. The scheme was worked out at a meeting in Colombo in July, and it became the subject of a further meeting of the Commonwealth Consultative committee which took place in London in September and early October, and at which the government of Ceylon and other governments were represented. The report dealt in detail primarily with the problems and programs of the Commonwealth governments in the area. For the needs of other countries it was hoped that at a later stage similar programs would be prepared so that the whole area could be fully covered. In regard to Ceylon the report examined the government's own program, the success of which depended primarily on adequate external finance and on the availability of technical experts, and pointed out that the current rate of investment was doing no more than maintain the present standard of living and the social services essential thereto. The view of the government confirmed the opinion that a higher level of capital investment was necessary to further progress, and that failure to implement the six-year program would mean the indefinite postponement of diversification of the economy and the expansion of food production. The Plan for Co-operative Economic Development in South and Southeast Asia appeared as a White Paper at the end of November. It contained development programs for India, Pakistan, Ceylon, Malaya and North Borneo. (E. Hd.)

**Education.**—Schools (1948): government and assisted 6,231, pupils 1,181,430; central and bilingual English 523, pupils 229,064. Technical college (1949–50): students 1,969. University (1949–50): students 1,850.

**Finance and Banking.**—Budget (1949–50 est.): revenue Rs. 560,000,000, expenditure Rs. 558,000,000; (1950–51 est.): revenue Rs. 656,000,000, expenditure Rs. 654,100,000. Gross national debt (Sept. 1949) Rs. 549,100,000. Currency circulation (March 1950) Rs. 230,400,000. Bank deposits (March 1950) Rs. 678,700,000. Monetary unit: rupee with an exchange rate of Rs. 4.775 to the U.S. dollar.

**Foreign Trade.**—(1949) Imports Rs. 1,032,000,000; exports Rs. 1,068,000,000. Main sources of imports (1949): United Kingdom 18%; India 15%; Burma 15%; Australia 10%. Main destinations of exports (1949): United Kingdom 33%; United States 11%; Australia 8%; Canada 4%.

**Transport and Communications.**—Roads (1948) 6,647 mi. Licensed motor vehicles (Dec. 1949): cars 31,261; commercial 13,230. Railways (1948): 894 mi.; passengers (1948) 26,500,000; freight (1948–49) 1,290,000 metric tons. Air transport (1949): miles flown 1,181,000; passenger-miles 7,165,000. Radio receiving set licences (Dec. 1949) 27,317.

**Agriculture.**—Main crops (metric tons): tea (1949) 135,400; rice (1949) 331,000; cassava (1947) 203,000; sweet potatoes and yams (1947) 73,000. Fresh coconut exports (1949): 12,897,000. Livestock (Dec. 1948): cattle 1,133,000; buffaloes 658,000; sheep 55,000; pigs 95,000. Oils and fats production (metric tons, oil equivalent, 1949): 135,000.

**Industry.**—Fuel and power: manufactured gas (1949) 8,040,000 cu.m.; electricity (1949) 59,000,000 kw.hr. Raw materials (metric tons): rubber (1949) 90,921; graphite (exports, 1949) 12,434; salt (1949) 28,775.

**Chambers of Commerce.** **United States.**—At the end of 1950 the membership of the Chamber of Commerce of the United States consisted of more than 3,100 chambers of commerce and trade associations, with an underlying membership of more than 1,250,000 firms and corporations. During the year the chamber carried out a pro-

gram designed to strengthen the national economy and to encourage its expansion to meet the needs of a growing population. After the outbreak of war in Korea in June, the beginning of defense mobilization brought adjustments in the program to meet the new situation.

Through its departmental structure, the chamber throughout the year gave attention to all phases of the economy. It sought better labour-management relations; promoted closer understanding between business and agriculture; encouraged more practical city planning; pointed the way toward better government through reorganization; urged reduction in less essential federal expenditures; gave attention to housing needs; proposed co-ordination of national transportation facilities; and worked for expansion of private investment.

Through its executive committee, the chamber pledged fullest support for necessary financial measures to check soviet aggression. Accepting the need for greatly increased armaments, it recommended tax increases for that purpose, reversing an earlier chamber policy calling for tax reductions.

The demands of World War II and those of the Korean campaign served to focus greater public interest in the status of the nation's natural resources. The chamber's Natural Resources committee was active in developing national realization that intelligent utilization and practical preservation of its natural resources are vital to the country's well-being and defense integrity.

The chamber continued its drive against Communist infiltration, and, in collaboration with other organizations, sought to determine what misconceptions may persist about the American way of life. Its American Opportunity program, designed to bring a better understanding of the functions of business enterprise, was broadened accordingly in the dissemination of factual data relating to the American system.

At the annual meeting in May, Otto A. Seyferth, of Muskegon, Mich., president of the West Michigan Steel Foundry company, was elected president of the chamber. At its September meeting, the board named Arch N. Booth executive vice-president to succeed Ralph Bradford, who became international vice-president, a newly created office. (Oo. S.)

**Junior Chambers of Commerce.**—Composed of young men between 21 and 36 years of age, from all religions, businesses and professions, the Junior Chambers of Commerce are principally concerned in giving their volunteer services to the civic betterment of their communities. The U.S. Junior Chamber of Commerce was founded on Jan. 21, 1920, in St. Louis, Mo. It had in 1950 more than 1,900 local organizations, with approximately 200,000 individual members. The organization is affiliated with the Junior Chamber International, which in 1950 was composed of similar groups in 50 nations.

During the year the national convention was held in Chicago, Ill. Richard W. Kemler, attorney of Marshalltown, Ia., was elected the 31st national president. The organization's activities for the year emphasized Americanism and included a nation-wide education program on a community level, dedicated toward keeping the people of the United States mindful of their blessings and of the responsibilities of freedom. Another activity was the support of the Hoover commission recommendations for administrative reform of the executive branch of the United States government.

The national headquarters, located in Tulsa, Okla., was to be housed after March 1951 in a new Jaycee war memorial building, located at Boulder-on-the-Park in Tulsa.

*Future*, a monthly magazine devoted to interests of members, is published by the U.S. Junior Chamber of Commerce; on Sept. 11, 1950, it was awarded the Brad Corbin Memorial award given each year by the Society of Industrial Editors to the publication showing the greatest improvement. (H. C. H.)

**Canada.**—In January 1950 the Canadian Chamber of Commerce made its annual presentation to the federal government, in which it defended business profits and recommended: (1) barring Communists from government employment; (2) prohibiting strikes until after a secret government-supervised strike vote; (3) eliminating trade restrictions. In a special brief in March, the chamber asked the federal government to check spending on the civil service, equalize taxation on private and co-operative business and reduce taxation. Resolutions passed at the chamber's annual convention in September included: vigorous opposition to socialism; endorsement of (1) holding of statutory holidays (except New Year, Good Friday, Christmas) on the nearest Monday, (2) increased selective immigration, (3) reopening of the Winnipeg grain exchange, and (4) go-slow federal social-welfare policy. The junior chamber of commerce promoted study of municipal government, public speaking and community betterment among its members. (C. Cy.)

**International.**—In 1950 the International Chamber of Commerce welcomed two important developments for which it had long worked, namely: (1) the British government's decision to give unilateral relief from double taxation, which the chamber had for many years pressed on governments of all parties, as a temporary relief until the full system of double taxation treaties could be achieved; and (2) the European Payments union, a project which the chamber had strongly supported, as a valuable stage toward world-wide interconvertibility of currencies.

The chamber also contributed to important developments in two other fields. At the request of the United Nations Transport and Communications commission and of the Economic Commission for Europe it drew up recommendations on the basic principles which, in the interest of users, should govern any national or international system of co-ordination of different modes of transport. Similarly, the chamber's reports on the removal of barriers to the international transport of goods were used as basic documents by the U.N. Economic and Social council and by the British government's working party on this subject.

The chamber published recommendations on (1) the Schuman plan, as one item in the general progress toward the economic co-ordination of European industry; (2) the improvement of distribution censuses; (3) the lessening of flag discrimination in sea transport and port delays, both of which materially increased the prices of goods to the ultimate consumer; (4) the organization by businessmen of schemes designed to handle or avoid both burdensome surpluses of primary commodities, such as those which disorganized world economy in the 1930s, and shortages of such commodities, without excessive price increases, such as those which took place in the later months of 1950 because of rearmament and stockpiling; and (5) the "pros and cons" of guarantees by the governments of capital-exporting countries, as a means of encouraging foreign investments in underdeveloped countries.

The following printed reports were published during the year: *Financing Economic Development; Means for Promoting the Grant of Patents Licences in the International Plane; Code of Standards of Advertising Practice; Speeding up Air Transport.*

**Chapman, Oscar Littleton** (1896— ), U.S. secretary of the interior, was born on Oct. 22 in Omega, Va., served in the navy in World War I and received a law degree from Westminster Law school, Denver, Colo., in 1929. He was chairman of the Colorado state Child Welfare committee and later president of the Colorado state board of control. In May 1933 he was appointed assistant secretary of the interior, and served for a dozen years as a member

of Pres. F. D. Roosevelt's so-called "little cabinet." In Dec. 1949 he became secretary of the interior. Chapman's function under the defense mobilization plans announced Sept. 9, 1950, by Pres. Harry S. Truman was to control petroleum, gas, solid fuels and electric power. In October he set up a new Petroleum Administration for Defense, whose first task was to increase the output of aviation gasoline. Earlier, in a report to congress, he said that oil could be extracted from shale and coal cheaply enough to compete with petroleum.

**Chemistry.** **Nitrous Oxide in the Atmosphere.**—That traces of nitrous oxide (laughing gas) may be in the atmosphere had been suspected previously but not until 1950 was its presence actually verified. R. L. Slobod and M. E. Krogh of the Atlantic Refining company (Dallas, Tex.) used the mass spectrometer in confirming this discovery.

Samples of air were first freed from carbon dioxide and water vapour, then any nitrous oxide was frozen out by cooling the air at one-half atmosphere of pressure to the temperature of liquid nitrogen ( $-195^{\circ}\text{C}$ ). The reduced pressure in the system kept any oxygen from liquefying. The condensed nitrous oxide was then transferred to the mass spectrometer for its analysis.

These investigators found 0.00005% of nitrous oxide in dry air, about the same as krypton and a little more than xenon. These concentrations represent the values of the more rare components of dry air (per cent by volume): hydrogen 0.01, neon 0.00123 to 0.0018, helium 0.0004 to 0.0005, krypton 0.00005 to 0.0001, nitrous oxide 0.00005, xenon 0.000006 to 0.000008.

**Hydrogen Production.**—Industrial hydrogen has long been a challenging problem because of its use in the manufacture of ammonia, the hydrogenation of oils and the like. Its increasing use in the petroleum industry prompted V. N. Ipatieff, G. S. Monroe and L. E. Fischer of Universal Oil Products company to investigate methods of low-temperature hydrogen production. They found that a mixture of methane and steam could be converted into carbon dioxide and hydrogen if passed over a nickel-kieselguhr catalyst at  $500^{\circ}$ – $650^{\circ}\text{C}$ . If alumina or magnesia were used as carriers for the metal instead of kieselguhr, the catalytic effect was lessened greatly.

**Iodine Heptafluoride.**—H. Moissan observed in 1903 that iodine pentafluoride underwent pyrolysis at  $500^{\circ}\text{C}$ , yielding iodine. He concluded that a higher fluoride of iodine must have been formed in the reaction, but it remained for O. Ruff and R. Keim in 1930 to capitalize on this observation and discover iodine heptafluoride.

During 1950 W. C. Schumb and M. A. Lynch, Jr., of Massachusetts Institute of Technology, Cambridge, reported on their studies dealing with the preparation and properties of this compound. They pointed out that this white solid is unique in being the only simple binary compound (*i.e.*, one made up of two elements) in which sevenfold co-ordination is exhibited. It is interesting also in that it is a possible substitute for fluorine in certain fluorination processes.

The synthesis was accomplished by reaction of fluorine with either iodine or iodine pentafluoride at  $290^{\circ}\text{C}$  in metal equipment, using copper, nickel and monel. The compound was purified by fractional sublimation. It is a solid below  $4^{\circ}\text{C}$  but vaporizes at this temperature to a colourless gas.

Schumb found that this material will convert dichlorodifluoromethane ( $\text{Cl}_2\text{CF}_2$ ) into chlorotrifluoromethane ( $\text{ClCF}_3$ ).

**Titanium.**—With a commercially adaptable process at hand in

recent years for the production of titanium metal (via  $\text{TiCl}_4 + \text{Mg}$  at  $900^{\circ}\text{C}$ .) it was reasonable to expect advances in the chemistry and utilization of this element. Its expense as compared with that of steel, aluminum or copper restricts its uses to places where these metals cannot function satisfactorily. O. C. Ralston and F. J. Cservenyak of the U.S. bureau of mines listed several potential uses which were based on the favourably combined properties of high strength, light weight and resistance to corrosion. The optical metallography of titanium was studied by W. L. Finlay and others of Remington Arms company.

They reported it to undergo an allotropic transformation at  $885^{\circ}\text{C}$  and to deform at room temperature both by slip and by twinning.

In the field of titanium alloys B. W. Gonser of Battelle Memorial institute reported that the relatively high melting point of  $1,725^{\circ}\text{C}$  discourages attempts to alloy titanium with those metals which are fairly volatile at this temperature, such as zinc, cadmium or magnesium. A practical difficulty also is the reactivity of titanium with oxygen or nitrogen at these high temperatures. Alloys with carbon, silicon, iron, nickel, manganese, aluminum and tungsten were studied, all of which showed changes in strength or workability as compared with pure titanium. P. H. Brace of Westinghouse Electric corporation and E. I. Larson of P. R. Mallory & Co. (Indianapolis, Ind.) were also active in developing titanium alloys. The Westinghouse group prepared about 50 alloys and melted them by induction heating. Thorium oxide crucibles were the most satisfactory refractory material found. Alumina was quite unacceptable, since molten titanium reacted exothermically with it. E. A. Gee of E. I. duPont de Nemours & Co. established that titanium ingots containing up to 1.5% carbon can be forged and rolled. This carbon content might be acquired by induction melting of titanium in graphite crucibles. The carbon-titanium mass was forged readily at  $930^{\circ}\text{C}$  and was rolled at  $790^{\circ}\text{C}$ .

W. B. Blumenthal and Howard Smith of the National Lead company developed the synthesis of titanium tetraiodide from which titanium metal is obtainable by pyrolysis at temperatures of  $1,100^{\circ}\text{C}$ . Essentially, their plan was to treat a titanium-aluminum alloy with iodine. The mixture of titanium and aluminum iodides thus produced was mixed with potassium iodide and heated. Potassium iodoaluminate remained as residue and titanium tetraiodide distilled over.

D. F. Taylor of Fansteel Metallurgical corporation pointed out that while titanium is quite resistant to corrosion by acids under certain conditions, it does not compare with the inertness shown by tantalum.

**Chromyl Chloride.**—Use of this reagent,  $\text{CrO}_2\text{Cl}_2$ , dates back to 1881 when A. Etard discovered that it was capable of converting toluene into benzaldehyde. Etard's reaction was extended to substituted toluenes and to some terpene hydrocarbons but the mechanism of the reaction was obscure and the reaction was neglected in recent years. It had never been used with simple aliphatic hydrocarbons.

S. J. Cristol and K. R. Eilar of the University of Colorado, Boulder, investigated the behaviour of chromyl chloride toward cyclohexene, propylene, 1-butene, 1-pentene and 1-hexene. After addition of water to the reaction product, chlorohydrins were formed:  $\text{RCH}=\text{CH}_2 \rightarrow \text{RCHClCH}_2\text{OH}$ . The chlorohydrin from cyclohexene was of trans configuration. To explain these results Cristol suggested that the initial brown, solid adduct is an ionic product,  $(\text{RCHCH}_2\text{OCrOCl})^+ \text{Cl}^-$ , which later becomes stabilized as  $\text{RCHCl}-\text{CH}_2\text{OCrOCl}$ . Hydrolysis to the chlorohydrin is easily visualized with these steps in mind.

**Reactions of Phosgene.**—In spite of its poisonous nature, phosgene was used in industrial operations for many years. It is reactive and readily made from carbon monoxide and chlorine.

Its reaction with amines to yield isocyanates had long been known, but in spite of this no satisfactory synthesis of simple alkyl isocyanates was at hand until 1950 when R. L. Jenkins and collaborators of Monsanto Chemical company reported on this subject. They carried out successful preparations of isocyanates, carbamyl chlorides and cyanuric acid, starting with phosgene and amines. To do this, methylamine and phosgene were conducted into a reactor tube held between 240°–350° C., giving rise to methylcarbamyl chloride in high yield. Other primary and secondary amines behaved analogously:  $\text{COCl}_2 + \text{RNH}_2$  (or  $\text{R}_2\text{NH}$ )  $\rightarrow$   $\text{RNH-CO-Cl}$  (or  $\text{R}_2\text{NCOCl}$ ) +  $\text{HCl}$ . Conversion of the alkylcarbamyl chlorides into alkyl isocyanates,  $\text{RN}=\text{C}=\text{O}$ , was accomplished either by reaction with a tertiary amine such as pyridine or dimethylaniline, or by heating the chloride in solution in benzene or toluene to drive off the hydrogen chloride.

The isocyanates thus prepared are useful in the synthesis of ureas and urethans.

**Salts of Fatty Acids.**—Methane is formed if sodium acetate and sodium hydroxide are fused together at 370° C. This well-known observation was taken as the basis for the assumption that other salts such as the propionate, butyrate, etc., also would decompose thermally with caustic to form alkanes. That this is not a general reaction, however, was demonstrated by T. S. Oakwood and Maxine Miller of Pennsylvania State college, State College, Pa. Methane and hydrogen were formed in quantity along with lesser amounts of propane or pentane when the butyrate or caproate was substituted for the acetate.

Pyrolysis of calcium salts of fatty acids is a related reaction known to yield acetone from the acetate; industrial acetone was formerly prepared by this method. H. L. Hsu, J. O. Osburn and C. S. Grove, Jr., of the State University of Iowa, Iowa City, extended this reaction to calcium salts of  $\text{C}_{18}$  fatty acids, namely, stearic acid and the acids from tung oil. The stearate gave a 76% yield of distillate containing 4.4% of aromatic compounds, whereas that from tung oil gave 42% yield of distillate containing 26% of aromatics. The authors assumed that a ketone was formed first which decomposed into carbon monoxide, and hydrocarbons containing paraffins, olefins and aromatics. It was pointed out that the distillate from the stearate had a chemical composition which was similar to Pennsylvania crude oil (a paraffin base oil), whereas that from tung oil is not unlike Gulf Coast crude oil (a naphthene-asphalt base oil).

**Synthetic Rubber.**—The synthetic rubber which was produced during 1943–46 was made essentially by treating an emulsion of butadiene and styrene in soap solution with a peroxide catalyst at a lukewarm temperature of 50° C. The material was superior to natural rubber in some respects but inferior in others. As regards stability against oxidation at elevated temperatures, the synthetic product was superior, but it was of lower tensile strength and caused much more build-up of heat on flexing.

These difficulties were largely overcome by use of the new "cold processes" in the manufacture of synthetic rubber. This new process operated at 5° C. instead of 50°, but to make it possible, it was necessary to incorporate substantial changes in the polymerization recipes. The cold-rubber recipe which is most widely used makes use of cumene hydroperoxide as the oxidant and *tert*-dodecyl mercaptan as modifier. Glucose and ferrous pyrophosphate, the oxidation-reduction catalyst, also are part of the formulation. By operating at 5° C. the cold rubber acquires tensile strengths above 4,000 lb. per square inch (comparable to natural rubber) in contrast to 3,000 lb. per square inch shown by the older synthetic rubber.

Another recipe capable of polymerizing the butadiene-styrene mixture at 5° C. was described by W. B. Reynolds of Phillips Petroleum company and E. W. Cotten of the University of Cincinnati, O. This made use of 2-naphthyl *p*-methoxybenzenedia-

X-RAY SPECTROGONIOMETER which analyzes the content and arrangement of atoms in an unknown chemical sample by measuring the angles at which the sample scatters an X-ray beam and recording the intensity of the rays. The machine was developed jointly by researchers of the General Electric Research laboratory and the General Electric X-Ray corporation

zothiolate,  $\text{CH}_3\text{O-C}_6\text{H}_4\text{-N}=\text{N-S-C}_{10}\text{H}_7$ , and ferricyamide ion.

To explain the parts played by these components, Reynolds suggested that the hydroperoxide changes to a free radical under the influence of ferrous ion:  $\text{ROOH} + \text{Fe}^{++} \rightarrow \text{RO}\cdot + \text{Fe}^{+++} + \text{OH}^-$ . The glucose in the recipe converts ferric ( $\text{Fe}^{+++}$ ) back to ferrous ion. Radical  $\text{RO}\cdot$  starts the polymerization process by attaching itself to a butadiene or styrene molecule thereby forming a new, larger radical which repeats the process in a chain reaction until a high polymer is attained. The reaction chain is terminated when the polymer radical becomes attached to another radical such as the original  $\text{RO}\cdot$  or a similar one derived from the mercaptan which is in the system.

In the diazothiolic process it is suggested that the initial free radicals are formed by direct decomposition:  $\text{R-N}=\text{N-S-R}' \rightarrow \text{R}\cdot + \text{N}_2 + \text{R}'\cdot$ .

**Detergents.**—The production of 100% active organic detergents in 1948 was about 268,000,000 lb. and the amount was expected to be much more in 1950. Not only were increasing quantities being used but their chemical composition was different from that of former years. Detergents such as ammonium dodecyl sulphate or ammonium glycerol laurate sulphate which had been widely used in shampoo formulations continued in that use, but the corresponding sodium salts which were once popular for laundering had been largely replaced by sodium dodecylbenzenesulphonate. Both the older and the newer detergents permit laundering in hard water without deposition of calcium salts, but the newer ones had the advantage of increased ability to remove dirt in laundering. The result of the change was that many of the newer detergents were equal to soap or even better than soap for this purpose.

To make dodecylbenzenesulphonic acid, benzene is first alky-

lated. One method places a tetramer of propylene in reaction with benzene and aluminum chloride. Another employs hydrogen fluoride instead of the aluminum chloride. There are other methods also. After the alkylbenzene is made and separated, it is sulphonated with sulphuric acid, then neutralized with caustic to obtain the desired sodium salt. Some sodium sulphate appears in all of these products, since it arises by neutralization of the excess of sulphuric acid. As a matter of fact, the presence of a little sodium sulphate has been reported to be beneficial.

Addition of other salts, particularly the phosphates, produces remarkable synergistic effects. Sodium pyrophosphate ( $\text{Na}_4\text{P}_2\text{O}_7$ ), sodium tripolyphosphate ( $\text{Na}_5\text{P}_3\text{O}_{10}$ ) and trisodium phosphate ( $\text{Na}_3\text{PO}_4$ ) are the "builders" which promote this greater detergent efficiency. Trisodium phosphate, however, is somewhat too alkaline for many purposes.

R. C. Merrill and Raymond Getty of Philadelphia Quartz company studied "builder mixtures" in laundering. Cloths soiled with carbon black, mineral oil and vegetable oil were used in the tests. The reflectance of the washed and ironed cloth, compared with an unsoiled specimen, was the experimental approach. The investigators were interested also in the prevention of deposition of such things as iron oxide, raw umber or ilmenite black on a cotton fabric.

Of the materials tested, sodium pyrophosphate was the most efficient builder for sodium dodecylbenzenesulphonate. Trisodium phosphate and sodium silicate, although good, were generally less effective. Sodium carbonate was still less effective.

**Thiophene.**—No large volume use for thiophene had materialized since 1946, when it was announced that it could be prepared at low cost from butane and sulphur at about  $600^\circ\text{C}$ . It found application, however, in the pharmaceutical field in the production of valuable drugs.

In 1950 R. E. Conary, K. L. Kreuz and others of the Texas company reported their discovery of an independent method for the production of thiophene. They found that a mixture of sulphur dioxide with butane or butene could be converted into thiophene at  $600^\circ\text{C}$ . in good yields if catalysts of these types were used: activated silica, molybdena-alumina, chromia-alumina, vanadia-alumina or molybdenum sulphide on alumina. Since this production of thiophene involves detachment of hydrogens from the butane as well as attachment of sulphur, it is logical to note that hydrogen sulphide, hydrogen and water appeared in the products of the reaction.

Pentane, similarly treated, gave rise to both thiophene and 2-methylthiophene. Isopentane yielded thiophene and 3-methylthiophene. Because the reaction involved is exothermic, it was found advantageous to use a fluidized catalyst system rather than a fixed bed of catalyst.

**Catalysts for Hydrocarbons.**—As a result of an invention by V. Haensel of Universal Oil Products company (Chicago), a new process became available for converting the molecules of straight-run gasoline into isomers of superior octane rating. Temperatures of  $430^\circ\text{--}480^\circ\text{C}$ ., pressures of 500–900 lb. per square inch and a platinum catalyst were found to bring about reactions of isomerization of open chain components of the hydrocarbon giving more branching in the carbon skeleton, and reactions of ring-enlargement of the cyclopentanes in the naphthenic portion to cyclohexanes with subsequent dehydrogenation of the latter into benzenes. The operation was called "platforming." Both of the effects described are important in improving the antiknock rating of motor fuel. In a commercial installation in Michigan an original reactor charge with an octane number of 52 was improved to 81 (or to 93 if tetraethyl lead was added).

K. K. Kearby of Esso laboratories New Jersey reported on catalysts which were developed to dehydrogenate butene into butadiene, and ethylbenzene into styrene, in the presence of steam

as diluent. The importance of this topic is evident, since butadiene and styrene are the two major ingredients in synthetic rubber. The following conditions were used in actual productions:

Reduced pressures, which were necessary to lessen carbon formation, were obtainable either by vacuum or by dilution with steam. The latter was preferable. A catalyst containing 1 part each of cupric oxide and potassium oxide, 4 parts of ferric oxide and about 16 parts of magnesium oxide was the one selected. The potassium oxide in the catalyst promoted the desired reaction and tended to inhibit carbonization. It was established that under conditions of use potassium carbonate was sufficiently volatile as to be gradually stripped from the catalyst but addition of potassium carbonate pellets in the tube ahead of the catalyst bed counteracted this undesirable effect, thereby giving a catalyst life of a few months in plant practice. Ultimate recycle yields of butadiene of 70% to 85% were obtainable at butene conversion levels of about 40% to 20%.

More information was released concerning details in the production of butadiene from ethyl alcohol. The American process, which produced three-fifths of the butadiene required for the World War II emergency synthetic rubber program, comprised two steps: dehydrogenation of alcohol to acetaldehyde, and catalysis of alcohol-acetaldehyde to butadiene. B. B. Corson and collaborators of Mellon institute reported that the highest catalytic activity was found at  $350^\circ\text{C}$ . when silica was combined with tantalum, or at  $300^\circ\text{C}$ . when silica was combined with zirconia or hafnia. The per pass yield of butadiene was 30%–35% and the final yield was 60%–64%.

Conditions for a one-step conversion of ethyl alcohol to butadiene were also sought. Oxide mixtures of silicon-magnesium-tantalum (or chromium) gave laboratory yields of 56% at  $400^\circ\text{--}425^\circ\text{C}$ ., somewhat less than the yields in the two-step process.

The demand for butene in the production of aviation gasoline, synthetic rubber and chemicals such as 2-butanol, methyl ethyl ketone or thiophene stimulated search for new sources of this olefin. A study of this problem at Shell Development company by H. A. Cheney, S. H. McAllister and coworkers revealed that it may be made in good yields from ethylene. Thus if ethylene is passed over a cobalt-charcoal catalyst below  $150^\circ\text{C}$ . at pressures of 1 to 100 atmospheres, a polymerization process occurs giving rise to higher boiling olefins of essentially unbranched structure. About half of the ethylene may be converted per pass. Three fourths of this product is butene and the remainder is hexene, octene and higher boiling olefins.

Cyclopentadiene is a hydrocarbon occurring in the low boiling fractions of coke-oven distillates. It has found important utility in the manufacture of plastics; hence it is of interest to find new sources of this substance. R. M. Kennedy and S. J. Hetzel of Sun Oil company found that by operating at  $600^\circ\text{C}$ . under diminished pressure, 1,3-pentadiene (piperylene) could be dehydrogenated to cyclopentadiene in yields of about 50% if the time of contact was only one-tenth of a second. This change was one of pyrolysis. Catalysts were not effective. The course of the reaction is evidently one in which free radicals are essential intermediates.

**Ascorbic Acid.**—A. K. Gherghelezhii (U.S.S.R.) discovered in 1937 that one of the richest natural sources of ascorbic acid is the green hull of the immature English walnut. The unripe walnut develops a maximum of 2% to 2.5% ascorbic acid on the wet basis (16%–20% on dry basis) just before hardening of the shell. During the final three months of ripening the yield drops to 0.3% (wet basis).

Since at least 100,000,000 lb. of hulls are produced annually in California alone, A. A. Klose, H. L. Fevold and coworkers of Western Regional Research laboratory developed these steps for the isolation of ascorbic acid: extraction in dilute sulphurous acid, purification of the extract by use of anion exchange resin

and crystallization of the eluent from the resin. At least one-quarter of the ascorbic acid was thus isolated as crystalline material. Pilot-plant size runs were carried out, but a major difficulty with the process was that it would function only 1 month out of 12.

**Khellin.**—Interest in this substance, obtained from the fruits of *Ammi visnaga* (L), arises from its use as an antispasmodic and a coronary vasodilator in the treatment of angina pectoris and bronchial asthma. Alexander Schönberg and Aly Sina of Fouad I university (Cairo, Egy.) extended the chemistry of khellin by preparing several of its derivatives and analogues.

Khellin is a colourless tricyclic compound whose structure may be visualized in this way. The central ring is that of hydroquinone dimethyl ether. To it is fused a furan ring on the left and a gamma pyrone ring on the right. A methyl substituent appears on the pyrone ring.

Schönberg and Sina found it possible to cleave the pyrone ring with boiling alkali. The "khellinone" thus obtained could be taken back to khellin by condensation with ethyl acetate and sodium. By using ethyl formate, ethyl propionate or ethyl butyrate in place of the ethyl acetate, they were able to synthesize lower and higher homologues of khellin, compounds in which the methyl group was replaced in turn by hydrogen, ethyl or propyl groups. These and other compounds were being tested pharmacologically.

**Blood Plasma.**—J. B. Lesh, K. Schultz and J. D. Porsche of Armour & Co. described the details of a plant designed specifically for fractionation of blood plasma. Processing equipment was so constructed that the plasma (from about 8,000 donors per week) and all reagents used came in contact only with glass, rubber or stainless steel to avoid excessive metallic contamination. Since the plasma was for parenteral use, all pyrogens had to be absent. This was a major difficulty. Their detection was greatly simplified once it was learned that most pyrogenic materials are taken up quantitatively on albumin. Pyrogen-free alcohol was obtained by careful distillation, but to keep distilled water free of pyrogens it was found necessary to store it hot (80° C.).

The plasma was separated from the red cells by use of continuous centrifugals. Then 53% ethyl alcohol was added to the plasma to precipitate fibrinogen. After separation in refrigerated centrifugals, the liquid was transferred to a tank for precipitation of the next fraction, and so on until four such fractions were prepared. Removal of alcohol from the protein precipitates was effected by drying with high-vacuum equipment in the frozen state. The primary products of plasma fractionation, namely, albumin and the gamma globulins, are generally packaged as sterile solutions in as concentrated form as possible.

**Enzymatic Oxidation of Aliphatic Acids.**—The fate of carbohydrates and fats in the body has always interested the biochemist. The carbohydrate problem has been well answered for some time, but the study of fatty acids in enzymatic terms was, until recently, beyond reach. Perhaps the biggest obstacle has been the loss of activity of a tissue (such as the liver) when it is pulverized or extracted. J. M. Muñoz and L. F. Leloir showed in 1943, however, that homogenized guinea pig liver could oxidize butyric acid if it was supplemented with adenylic acid, magnesium salts, orthophosphate ion, cytochrome-c and succinic acid; but these same factors were incapable of oxidizing the higher fatty acids such as palmitic, oleic or stearic. A. L. Lehninger of The University of Chicago extended knowledge in this field greatly during the years 1945-50. He was able to make enzyme preparations from rat liver which would catalyze the oxidation of all the normal fatty acids from butyric (C<sub>4</sub>) to stearic (C<sub>18</sub>). He washed a saline suspension of liver particles, then supplemented it with adenosinetriphosphate, magnesium

salts and inorganic phosphate. In this slightly alkaline medium (pH 7.4) the aliphatic acids consumed oxygen, giving rise to sodium acetoacetate, quantitatively. The equation from octanoic acid illustrates this:

Apparently this equation is a summation effect, for what happens first is a breakdown into acetate ions. Two acetate ions then combine to form the acetoacetate:  $2 CH_3COO^- \rightarrow CH_3COCH_2COO^- + OH^-$ . The correctness of this was demonstrated by S. Weinhouse, *et al.*, of the University of Pennsylvania, Philadelphia, by use of isotopic carbon. If octanoate ion was used containing heavy carbon at atom 1,  $C_7H_{15}C^*OO^-$ , it was found that the acetoacetate ion formed contained heavy carbon at atoms 1 and 3,  $CH_3C^*OCH_2C^*OO^-$ . This could be explained if acetate ion ( $CH_3COO^-$  and  $CH_3C^*OO^-$ ) were formed first.

Lehninger carried his biochemical studies still further and found that enzymatic activity of the liver was concentrated in the rod-shaped mitochondria present in the cytoplasm. The mitochondria could be separated from other parts of the liver cell by differential centrifugation of liver dispersed in concentrated sucrose syrup. The mitochondria of the rat liver cell make up one-third of the total nitrogen of the cell. They contain protein, ribonucleic acid and phospholipids. They have been aptly described as the "power plants" of the cell. (See also BIOCHEMISTRY; CHEMOTHERAPY; PHYSICS; VITAMINS.)

**BIBLIOGRAPHY.**—*Chemical Abstracts*, vol. 44; *Ind. Eng. Chem.*, vol. 42; *Chem. Eng. News*, vol. 27; *J. Am. Chem. Soc.*, vol. 72. (C. D. HU.)

**Chemotherapy.** During 1950 it was demonstrated that cortisone (Compound E from the adrenal gland) and ACTH (adrenocorticotrophic hormone from the pituitary gland) often provide prompt and dramatic relief in rheumatoid arthritis, gout, lupus erythematosus, myasthenia gravis and other diseases, although the improvement usually was maintained only as long as the administration of the drug was continued. They were also found to have some value in the treatment of acute rheumatic fever and the whole gamut of collagen diseases. A number of disease conditions of the eye, for which adequate treatment had not been available heretofore, were found to respond dramatically following administration of these substances. ACTH demonstrated spectacular effectiveness in the treatment of severe and extensive burns by preventing loss of serum and the development of contractures. Burn therapy was revolutionized as a result of these findings. The physiological effects of cortisone and ACTH proved to be of vast importance to investigators studying the fundamental factors responsible for a multitude of disease states. The effect of ACTH on the circulating eosinophil count was found to be a satisfactory test for adrenocortical hormone reserves and thus allowed the physician to predict how well a patient might be expected to withstand the stress of major surgery. Adrenocortical hormone (ACE) was found to give promising results in the treatment of acute alcoholic intoxication, delirium tremens and Korsakoff's psychosis.

Cortisone and ACTH were not generally available during the first half of 1950 because of difficulties in production and lack of confidence regarding their safety for general use. However, by the end of the year an adequate supply of these drugs for use by the medical profession was assured and their relative safety for such use was established.

Terramycin, a new antibiotic of the broad spectrum type, came into general use during 1950. It was found to be of value in the treatment of infections caused by a wide variety of bacteria as well as by certain viruses and rickettsial forms. This antibiotic took its place with aureomycin and chloramphenicol which have a quite similar range of usefulness. The wide spectrum

antibiotics were being produced at the rate of approximately 8,000 kg. per month during 1950. Other antibiotics such as Vio-mycin, which showed ability to combat experimental tuberculosis infections, were subjected to preliminary evaluation during 1950.

A new sulfonamide drug, Gantrisin, was shown to be of relatively low toxicity and particularly suitable for the treatment of urinary infections. The high solubility of this drug tended to obviate the concern regarding most sulfonamide drugs as to possible harmful effects on the kidneys. It was demonstrated to be superior to antibiotic preparations for certain urinary infections.

Antihistaminic drugs, which had demonstrated usefulness in the treatment of certain allergic conditions, were extensively promoted for the common cold. Although the antihistaminics may afford some degree of temporary relief from symptoms in the common cold, it seemed questionable that this possible effect is of any significance. (See COLD, COMMON.)

Banthine, a quaternary amine having anticholinergic properties, was found to have value in the therapy of peptic ulcer. Dryness of the mouth, blurring of vision and difficulty in urination occasionally complicated therapy, but the drug gave definite promise of possibly obviating the need for surgery in many ulcer patients. Banthine was also found to have value in the treatment of hyperhydrosis.

Much interest was manifest during 1950 in preparations having muscle-relaxing properties. Mephenesin was shown to have the ability of reducing spasticity or exaggerated reflexes without significantly affecting voluntary neuromuscular control, and useful in the control of palsy or Parkinson's disease. Mephenesin also proved to be an excellent relaxing agent in the management of tetanus convulsions. Synthetic curarelike substances such as Syncurine, which is related to d-tubocurarine, were also evaluated. They have valuable muscle-relaxing qualities which facilitate surgical anaesthesia.

Drugs such as Priscoline were found to be useful in the treatment of peripheral vascular disease. The vasodilating action of these drugs was determined by measuring the increase in volume of the extremities when the venous outflow was prevented and by observing the increased temperature of the extremities attendant on a greater blood flow. Priscoline demonstrated superiority over papaverine and nicotinic acid as a vasodilator of the blood vessels of the extremities.

Veriloid, a preparation obtained from *veratrum viride*, was found to have potent hypotensive properties. The ability of this drug to lower blood pressure led to its use in the treatment of hypertension. Although it cannot be regarded as a cure for high blood pressure, Veriloid was found to have value in the treatment of selected cases of this disease.

Khellin (*visamin*), a drug of Egyptian origin, was found to have some value in the treatment of angina pectoris, although it was not shown to have any definite superiority over the nitrites in this condition. Its value in the therapy of bronchial asthma was not conclusively established. Tetraethylammonium chloride was also reported to be of value in angina pectoris.

Pronestyl (procaine amide hydrochloride) was shown to be effective in abolishing irregular rhythms of the heart known as ventricular tachycardias. The drug was found to be of particular value in patients subjected to surgery who developed cardiac irregularities under anaesthesia.

Preliminary studies indicated that choline may play a role in the prevention of coronary disease. The results obtained were not conclusive, however, and many patients were unable to tolerate the high doses of choline considered necessary in therapy.

There was interest in anticoagulant therapy for combating pulmonary embolism and coronary thrombosis. In addition to

INJECTING ACTH into a fish which was raised in darkness and developed a cancerous growth. This was part of a 1950 research project sponsored by the American Cancer society to test the belief that light reduces hormone secretion and to determine the relationship of light and hormones to growth and cancer

heparin and dicumarol, a new anticoagulant, Tromexan, was subjected to evaluation. The results of anticoagulant therapy thus far were quite encouraging.

Several new drugs for the treatment of epilepsy came into general use. Mesantoin and Phenurone were shown to possess a certain amount of value in the control of psychomotor and *grand mal* seizures. However, the new drugs offered for the treatment of epilepsy must be administered with caution, primarily because of the possible toxic effects on the blood-forming organs of the body.

Intravenous infusions of a 15% fat emulsion brought clinical improvement and prevented weight loss in a series of patients unable to tolerate food by mouth. Although protein in the form of a hydrolysate or amino acid mixture and dextrose was successfully administered intravenously, it was formerly believed that fat could not be given by this route.

A dye, di-iodofluorescein, containing radioactive iodine was found to be effective in establishing the location of brain tumours. When injected intravenously it tended to localize in the tumour.

A resin of podophyllum demonstrated some value in destroying cancerous and precancerous skin lesions. Applied topically, the drug was quite effective against a variety of skin cancers.

DFP (di-isopropyl fluorophosphate) was found to be of value as a means of reducing intraocular pressure in glaucoma.

Atropine was found to be a specific antidote for poisoning caused by the new phosphorus-containing insecticides such as parathion.

There was a considerable revival of interest in BCG vaccination as a means of control of tuberculosis during the year. A need for further well-controlled studies to establish conclusively the value as well as the limitations of the vaccine was evident.

**Drug Production.**—The monthly production of drugs in the United States remained at a high level in 1950. For example, June production of streptomycin and dihydrostreptomycin, reported by the U.S. tariff commission, was 1,640,346 g. and 5,104,609 g., respectively; penicillin producers provided 15,769,000,000,000 units in June. Output of penicillin for the first six months of the year was 97,350,000,000,000 units, compared with 63,228,000,000,000 units in the same period of 1949. June production of

ascorbic acid and its salts amounted to 80,049 lb.; niacin and niacinamide 102,415 lb.; thiamine (B<sub>1</sub>) 19,314 lb.; sulfa drugs 384,364 lb.; phenobarbital and sodium salts (sleeping tablets) 27,526 lb.; and aspirin 921,269 lb. The medicinal and pharmaceutical preparations exported in June alone were valued at \$19,847,878.

Drugs of animal origin imported during the first six months of 1950 were valued at \$2,456,491; the figure for the same six-month period in 1949 was \$1,605,162. (See also ALLERGY; BACTERIOLOGY; CHEMISTRY; MEDICINE; PNEUMONIA; SURGERY; UROLOGY; VITAMINS.)

(R. T. S.)

**Chemurgy.** Years of chemurgic research enabled U.S. retail stores to display during 1950 new fabrics from the cornfields. The fabrics were made with Vicara, trade name of a fibre derived from zein, the protein of corn. Of the dry substance of the corn kernel 65% is starch, which enters into a multitude of industrial processes. The 10% protein content had only recently achieved any industrial importance. It had found some use in plastics, and rather extensive use as a coating for papers which required resistance to grease or moisture. This latter use became especially important for protecting war supplies shipped into the Pacific areas.

This soft, resilient new fibre also had other and quite different uses. On the market in 1950 were bathing suits, hosiery, sweaters, upholstery fabrics and artificial suede leather in which Vicara was the principal constituent. The fibre is resistant to moths and mildew as well as to all ordinary solvents. The manufacturers said that it is nonallergenic, free of odour and readily launderable, and blends easily with other fibres. It was manufactured in a plant at Taftville, Conn.

About half the total product of the cornfields is stalks, and only limited success had been attained by 1950 in finding commercially profitable uses for them. The most continuous effort had been made by a manufacturer of Dubuque, Ia., who for several years with varying success had manufactured wallboard with cornstalks as the raw material. Experiments led to the addition of flax shives and hemp hurds as an additional raw material. The shives and hurds were discarded when the fibre was extracted from flax straw and hemp stalks, and had no market. The company found, however, that its product was improved and costs lowered by putting the shives and hurds, as well as cornstalks and some wood pulp, into the process. About 120,000 lb. of the board were produced daily by 130 employees in 1950, and marketed through a mail-order company.

A new crop made one of the more spectacular chemurgic gains of 1950. This was safflower, an oriental plant long viewed as an important possibility for U.S. agriculture. The unsatisfactory oil content held back its acceptance. Several years of patient genetic experiments by the Nebraska Chemurgy project developed strains which yielded 34% oil, or more, instead of the 28% which had been characteristic of the plant in Asia. This, with improved yields, made safflower attractive both to farmers and to processors. The 1950 crop came from about 150,000 ac., by far the largest yet planted, of which 20,000 ac. were in Pacific coast states and most of the rest in western Nebraska and eastern Colorado.

Paint, varnish and linoleum manufacturers like safflower oil for its nonyellowing quality. Farmers in the Great Plains area like it for being drought-resistant and not expensive to grow, and because it affords an attractive alternative to wheat. On irrigated lands the returns ranged from \$75 to \$100 an acre, and on dry lands from \$30 to \$40.

Another oilseed crop, sesame, began to attract interest during 1950 in the southeastern states because of experimental successes. This area, which had experienced frequent restrictions

upon freedom to grow either cotton, tobacco or peanuts, its traditional money sources, had felt the need for a new cash crop. The difficulty with sesame had always been that the seed ripened at uneven intervals and tended to shatter before harvesting. The South Carolina Experiment station had obtained sesame seeds from nearly 20 different countries and from the University of Nebraska, Lincoln, where sesame breeding had been conducted. From plants which indicated the least tendencies for seed to shatter, strains were bred to combine other desirable characteristics.

Greenhouses permitted the process to be hastened by producing three crops a year.

The South Carolina station expressed confidence that within two or three years seed strains could be offered to the public which would meet all requirements. No new machinery would be needed by farmers. Yields from cotton lands ranged from 500 lb. to 1,000 lb. per acre, and the proportion of oil was high, being 45% to 55% of the seed's weight. The oil cake provides an excellent protein feed for livestock.

A new \$32,000,000 newsprint mill, the Coosa River mill in Alabama, utilizing southern pine pulp wood as its raw material, began operations early in 1950 with a capacity of 100,000 tons of newsprint annually. This was the second such mill in the south, the first having been established more than ten years before at Lufkin, Tex., where it had successfully operated.

An interesting minor chemurgic development of the year was the commercial use of curled casein fibres in air filters for automobile carburetors. This product replaced horse hair, formerly obtained from Argentina.

Being uniform and sanitary, it was expected that curled casein would also find its way into such uses as for upholstery.

(W. McM.)

**Cherries:** see FRUIT.

**Chervenkov, Vulko** (1900— ), Bulgarian prime minister, was born on Sept. 6 at Zlatitsa, Bul. He was educated at a Sofia Gymnasium and later worked as an army clerk. He joined the Bulgarian Workers' (Communist) party in 1919 and was a member of the central committee of the Communist Youth league, 1920–25. In Sept. 1923 he took part in an unsuccessful communist uprising. He was editor of the legal crypto-Communist newspaper *Budashte* ("Future") and the underground *Voinishki Glas* ("Soldier's Voice"). In Oct. 1925 he went to Moscow where he studied at the Marx-Lenin school of which he eventually became director. In 1941 Georgi Dimitrov, his brother-in-law, appointed him director of the Hristo Botev radio station broadcasting to Bulgaria. He returned to his country in Sept. 1944, becoming a member of the central committee of the Bulgarian Communist party and first secretary of its Politburo. In Sept. 1947, he was a Bulgarian delegate at the conference in Poland at which the Cominform was created. On Dec. 12, 1947, he was appointed minister of culture and on July 20, 1949, first deputy prime minister.

After the death of Vasil Kolarov on Jan. 23, 1950, Chervenkov succeeded him as prime minister.

**Chess.** The 51st annual championships of the United States Chess federation at Detroit, Mich., in July 1950 attracted a field of 117 contestants with the title and custody of the Sturgis trophy being won by Arthur B. Bisguier of New York city.

The 20-year-old junior champion of 1949 won with a score of 9½–2½. Winning eight games and drawing three, he lost only to Lester Spitzley of Detroit.

Herman Steiner of Los Angeles, Calif., retained his United

LASZLO SZABO (back to camera), of Hungary, and Larry Evans, aged 17, of the U.S., at the Silver Jubilee International Chess congress held at Hastings, Eng., in Jan. 1950. Szabo placed first in the master's tourney, Evans fourth.

States closed title, Larry Evans of New York city carried off speed laurels and James Cross of Glendale, Calif., became the new junior ruler. N. May Karff of Boston, Mass., and Mrs. G. K. Gresser of New York city were cochampions among the women experts.

Eliot Hearst, 18-year-old collegian, won the New York state title in a big field of older experts and helped Columbia university take both the National Intercollegiate league and the Columbia-Harvard-Yale-Princeton league team titles.

Bisguier tied for first honours in the Southern Counties Chess union tourney at Southsea, Eng. Trailing S. T. Tartakower of Paris by half a point going into the final round, the young U.S. expert defeated F. F. Alexander of England and gained a deadlock for the prize as Tartakower was held to a draw by the German champion, E. D. Bogoljubow.

Miguel Najdorf of Buenos Aires, Arg., triumphed in the masters' tournament at Amsterdam, Neth., going undefeated through 19 games for a count of 15-4.

Mikhail Botvinnik of the U.S.S.R., world open champion, was not called upon to defend his laurels, but awaited the results of the challengers' tourney in Budapest, Hung.

David Bronstein and Isaac Boleslavsky, soviet experts, tied in that event and in the subsequent play-off Bronstein triumphed and earned the right to meet Botvinnik in 1951 for the world championship.

The women's world championship at Moscow was dominated by soviet players, who took the first four places. Mrs. Ludmilla Rudenko annexed the honours as Mrs. Olga Rubsova, soviet national titleholder, was runner-up.

International team play was featured by the world tourna-

ment held at Dubrovnik, where Yugoslav experts won with a score of 45½-14½ after 15 rounds. (T. V. H.)

**Chiang Kai-shek** (1887- ), leader of nationalist China for two decades before his retirement in Jan. 1949 in order to give the nationalists and Communists a final chance to negotiate for peace, resumed the office of presidency of the national government in Formosa on March 1, 1950, when Acting Pres. Li Tsung-jen still remained in the United States apparently for reasons of health. Chiang declared that the Communists had placed China under soviet servitude and that he could no longer shirk his responsibility in fighting against soviet aggression in China. On March 12 his cabinet was reorganized without Li's faction and on March 16 he took direct control of the nationalist forces intensifying the defense of Formosa against anticipated Communist attack. Chiang stated on May 30 that the Communists could not hope to invade Formosa without extensive soviet aid. Following Pres. Harry S. Truman's statement on Korea and Formosa and the United Nations Security council's resolution on Korea on June 27, Chiang offered 33,000 men to the United Nations. The offer was not accepted by the U.S. state department. After Gen. Douglas MacArthur's visit to Formosa on July 31, however, Chiang stated on Aug. 2 that an agreement was reached between General MacArthur and him on the problems discussed by them and that the foundation for Sino-American military co-operation and a joint defense of Formosa had been laid. After Chinese Communist forces openly entered into the Korean conflict, Chiang urged, on Nov. 13, the Chinese troops in Korea to surrender to the United Nations and the Chinese people on the mainland not to fight for what he termed the soviet cause in Korea. (See also CHINA.) (H. T. CH.)

**Chicago.** Second largest U.S. city, a port of entry, and the county seat of Cook county, Ill., Chicago lies at the southwest corner of Lake Michigan. Its population, by preliminary estimates of the bureau of the census in April 1950, was 3,606,436, an increase of 6.2% over the 1940 population. For the six-county Chicago metropolitan area these estimates were 5,475,535, a 13.5% increase. The mayor in 1950 was Martin H. Kennelly.

The city in 1950 enjoyed a year of exceedingly high business activity, setting all-time records in several industries, including steel production, television and radio production and the output of electric power. Employment rose to a near all-time high and unemployment dropped to a very low level.

Bank clearings for 1950 increased 13.5% to \$40,674,982,675 from \$35,806,922,424 in 1949. New investment in industrial plants in 1950 amounted to \$325,347,000, compared with \$102,777,000 in 1949, the 1950 figure being the largest for any peacetime year. Retail sales in 1950 were estimated at \$4,500,000,000 for the year 1950, an increase of 5.8% over the 1949 retail sales. Chicago continued to be the world's largest centre of rail and air traffic.

There were no major labour difficulties in Chicago during the year. The total number of workers involved in strikes was 22,677 in 1950 as against 64,373 in 1949.

Passengers carried on the lines of the Chicago Transit authority continued to decline. In the first 11 months of 1950, the total passengers carried numbered 722,412,567, a decline of 11.3% from 815,386,590 passengers carried in a similar period in 1949.

An outstanding civic feature was the Chicago fair of 1950, held on the lake front. In spite of unfavourable weather and disturbed international conditions, attendance was 1,709,000.

All types of construction in the first 11 months of 1950 involved an estimated outlay of \$599,909,049, an increase of 65.8% over the first 11 months of 1949, when similar expenditures amounted

to \$361,038,152.

In the first 11 months of 1950 permits for individual homes in Chicago totalled 8,094; in suburban towns 18,795; and in unincorporated areas 4,628—a total of 31,517. At the same time there were constructed within the city limits 8,449 apartment units and in the suburbs 1,495 apartment units, for a grand total of 41,461 dwelling units in the period.

The total public assistance burden in Cook county in 1950 approximated \$67,800,000, with an average of 151,000 persons on relief rolls throughout the year. The December total for persons obtaining some form of assistance in Cook county was down to 140,000.

The 1951 budgets of the six governments that cover Chicago in whole or in part follow: city of Chicago corporate net operating fund \$87,157,836, bonded debt \$106,251,000; Cook county operating expenses \$44,291,519, bonded debt \$60,779,900; Cook county forest preserve operating expenses \$2,090,816, bonded debt \$7,875,000; Chicago board of education operating expenses \$98,248,781.14, gross bonded debt \$10,239,000; Chicago sanitary district operating expenses \$15,291,000, bonded debt \$140,844,500; Chicago park district operating expenses \$20,960,250.06, bonded debt \$59,711,700. (L. LN.)

**Child Labour.** **United States.**—Nearly 2,500,000 minors 14 through 17 years of age were employed full time or part time in Oct. 1950, according to estimates of the U.S. bureau of the census—a slightly larger number than in any October since 1945. Of these, 916,000 were 14 or 15 years of age, and 1,553,000 were 16 or 17 years of age. Two out of three in the 14- through 17-year-old group were in nonagricultural jobs. Somewhat more than half of these young workers were also attending school, according to estimates based on surveys in prior years. The peak vacation employment was about 750,000 more.

The amendments to the Fair Labor Standards act effective Jan. 25, 1950, extended the protection of its child-labour provisions to many thousands of young workers in interstate industries and agriculture. Special emphasis was placed by the U.S. department of labour, which is responsible for the enforcement of the act, on the administration of the provisions extending the 16-year minimum age to work in agriculture during school hours. In co-operation with representatives of other federal agencies and national organizations, an educational program was developed to obtain the interest and help of the public in putting this standard into effect.

In the cases closed during the year ending June 30, 1950, as a result of investigations made by the wage and hour and public contracts divisions, 18,857 minors under 18 were found in 4,219 establishments, of whom 4,702 or 25% were employed contrary to the child-labour provisions.

The most important advances in state child-labour legislation made during the year 1950 were in Maryland, where the former basic 14-year minimum age for employment was raised to 16, making this state the 23rd to adopt this standard. For minors under 18 years of age, work in a considerable number of hazardous occupations was also prohibited and advances were made in hours of labour and night-work standards.

A significant development in education in the United States had been an increased trend toward school attendance of young people of high school age, especially those of 16 and 17 years. In 1950 the estimated number of boys and girls graduating from high school was equal to 58% of the entire number of people 17 years old in the population.

There had also been an expansion, both in the schools and in the public employment services, of pupil personnel, guidance and placement activities to give young people assistance in obtaining suitable jobs and in working out satisfactory occupa-

tional adjustments.

Under the Defense Production act, the secretary of labour was made responsible for defense manpower. In the secretary's defense manpower order (general order no. 48 issued Sept. 29, 1950), provision was made for formulating programs and policies regarding recruitment, training and utilization of young workers, and regarding labour standards for their employment, working conditions and industrial health and safety.

**Great Britain.**—The raising of the school-leaving age in Great Britain from 14 to 15 showed its full effect in 1949. The number of 14-year-old children attending school in England and Wales in January of that year was 480,127, an increase of 220% over the number reported in Jan. 1947 (150,101). Progress was made in the establishment of County colleges at which young persons between 15 and 18 years of age not attending full-time school were required to attend part time, either for one whole day or two half days each week or for a period of eight weeks, or for two periods of four weeks, in each year. Nearly all the local education authorities had submitted to the ministry of education their plans for such colleges by the end of the year.

The Employment and Training act of 1948 permitted local education authorities to accept the responsibility for administration of youth employment service upon submission of plans to the ministry of labour and national service and approval by them. By Jan. 1950, about two-fifths of these authorities in England and Wales and most of the larger authorities in Scotland had submitted plans for taking over this responsibility.

Arrangements were made for co-operation between the schools and the education officers administering the employment services, and methods of training young workers were developed with representatives of employees and workers. The central administration of this program remained in the hands of the Central Youth Employment executive, responsible to the minister of labour and national service.

**International Labour Organization Standards.**—In 1950, convention 90, prohibiting night work of young persons in industrial undertakings, was ratified by India and Czechoslovakia, and convention 33, relating to minimum age for nonindustrial employment, was ratified by Uruguay. The United States, as a member country with a federal-state government, brought two conventions—one relating to night work of children in industry and one relating to labour inspection—to the attention of state governments for such action as they might find appropriate.

(E. S. J.)

**Children's Books.** Integrity of writing on the part of the standard authors and a fine originality contributed by the newer writers were paramount in the publications of 1950. Colour was used more lavishly in such picture books as Ingri and Edgar D'Aulaire's *Benjamin Franklin* and Leo Politi's *A Boat for Peppe* while Roger Duvoisin was at his most vivid in *Follow the Wind* by Alvin Tresselt. Animals were the subject for Clare Newberry's *T-Bone the Baby-Sitter* (cats) and *Blaze Finds the Trail* (horses) by C. W. Anderson, and imagination ran rampant in *If I Ran the Zoo* by Dr. Seuss (T. S. Geisel). Linoleum cuts illustrated *Dick Whittington and His Cat* by Marcia Brown. The Pennsylvania Dutch celebration of Easter was portrayed in *The Egg Tree* by Katherine Milhous, and *The Two Reds* by W. Lipkind and N. Mordvinoff was unusual and distinctive.

The selection of stories to read aloud to the six-to-eight-year-olds ranged from the loss of a tooth in *Excitement in Appleby Street* by R. and E. Crist to a jungle tale in *Picken's Great Adventure* by Norman Davis. A winter in the Laurentians was portrayed in *Philippe's Hill* by Lee Kingman, and a summer in Florida was the setting for the sensitive story by Ruth Sawyer, *The*

ILLUSTRATION from *The Door in the Wall*, written and illustrated by Marguerite de Angeli and awarded the 1950 John Newbery medal for the most distinguished contribution to American literature for children

*Little Red Horse*. Fanciful were *The Thirsty Lion* by Karine Forbes and *Elmer and the Dragon* by Ruth Gannett.

Easy-to-read stories with a modern setting were represented by *Big Brother* by Laura Bannon, *The Runaway Elephant* (more about Hezekiah Horton) by Ellen Tarry and *Lucky Days for Johnny* by Irene Smith. Indians and being lost in the woods contributed to the plot of *First Adventure*, a tale of the Pilgrims by Elizabeth Coatsworth. An English story which appealed was *Winkie, the Grey Squirrel* by Albra Pratten and for the train-minded boy there was *Caboose* by Edith Hurd. Dolls appeared in *Pawnee* by Thelma Bell and *The Most Wonderful Doll in the World* in which Phyllis McGinley differentiated between the dream and reality. Stories laid in other lands were *A Cap for Mul Chand* (India) by Julie Batchelor, *Magic Money* (Costa Rica) by Ann N. Clark and *The Storks of Lillegaard* (Denmark) by Wilhelmine Frisch. Texas in the 1900s was the setting for *All About Marjory* by Marian Cumming and California and the Spanish dons formed the background for *Tomás and the Red Headed Angel* by Marion Garthwaite. The transitory life of a preacher's family was pictured by Jean Bothwell in *Peter Holt, P. K.* Subtly fanciful was *The 13th is Magic* by Joan Howard, *The Taming of Giants* by Patricia Gordon, and the refreshing *The Story of Appleby Capple* by Anne Parrish. The real American boy was portrayed in *Martin Butterfield* by John Burgan and in *Windfall Fiddle* by Carl Carmer, while his exploits were further presented in *The Radio Imp* of Archie Binns. Stories by favourite authors were *Born to Trot* by Marguerite Henry and *Texas Tomboy* by Lois Lenski. *High Smoke* by Audrey Chalmers concerned life in the theatre,

and the amazing existence in a circus was told in *Hidden Trapezes* by Edward Fenton.

Older boys enjoyed the history and adventure in *Make Way for the Brave* (Oregon trail) by Merritt P. Allen, *Whaler 'Round the Horn* (whaling and Hawaii) by Stephen W. Meader and *The Secret Fiord* (England, Norway and the Hanseatic league) by Geoffrey Trease. Older girls were experiencing present-day problems in *Teru* (occupied Japan) by Lucy H. Crockett and in *Sumei's Golden Year* (China) by Margaret H. Bro; and they chuckled over *Sun in the Morning* (India) by Elizabeth Cadell. The trials of adolescent girls were pictured in the sensitively written *Margaret* by Janette S. Lowrey, in *Hoofbeats on the Trail* by Vivian Breck and in *To Tell Your Love* by Mary Stolz. Boys too had adjustments to make, as witness *Farm Boy* by Douglas Gorsline.

On the lighter side, they howled at the antigravity invention of *Peter Graves* by William P. Du Bois and thrilled to *Farmer in the Sky* (planet Ganymede) by Robert A. Heinlein.

Biographies were represented by Nina B. Baker's *Sir Walter Raleigh*; *Gandhi, Fighter Without a Sword* by Jeanette Eaton; *Abraham Lincoln: Friend of the People* by Clara I. Judson and Mabel L. Hunt's *Better Known as Johnny Appleseed*.

Excellent nature information was to be found in *Frogs and Toads* (grades 3-6) by Herbert Zim and in *Masked Prowler* (raccoon) by John and Jean George (grades 7-10). *The First Book of Indians* by Benjamin Brewster (pseud. for Mary Elting) proved excellent; *Everyday Machines and How They Work* by Herman Schneider and *First Book of Stones* by Maribelle Cormack met special needs. The arts were represented by Amy Hogeboom's *Boats and How to Draw Them, This is an Orchestra* by Elsa Z. Posell and *Pictures of France by Her Children* by Marion Cothren. An excellent book on comparative religions was *The Good Ways* by Delight Ansley, and folklore was enriched by *John Henry and His Hammer* by Harold Felton, *Jack O'Moora and the King of Ireland's Son* by Bryan MacMahon. Far eastern legends and folk tales were Chang Fa-Shun's *The Sky River* (China) and Harold Courlander's *Kantchil's Lime Pit* (Indonesia).

Books to share with the family were Ruth Seeger's *Animal Folk Songs for Children*, Better Homes and Gardens *Storybook* and the nostalgic *Second St. Nicholas Anthology* of Henry S. Commager. The need for fresh Christmas stories was met by Louise Fatio in *The Christmas Forest* (ages 4-8), by Tasha Tudor in *The Doll's Christmas* (ages 5-8) and by the artistically illustrated *Lucy's Christmas* of Anne Molloy (grades 4-6). A new publisher's series of U.S. history was the Random House "Landmark" books, and new editions of Virginia L. Burton's *Calico, the Wonder Horse*, James M. Barrie's *Peter Pan* and Beatrix Potter's *The Tale of Little Pig Robinson* appeared. (See also BOOK PUBLISHING; LITERARY PRIZES.)

FILMS OF 1950.—*Little Red Riding Hood* (Encyclopædia Britannica Films Inc.); *Rapunzel, Sleeping Beauty* (Sterling Films, Inc.).

(E. A. Gs.)

**Great Britain.**—An outstanding event of the year was the publication of *Four to Fourteen*, a selective, annotated catalogue of about 1,200 children's books, compiled by Kathleen M. Lines for the National Book league. The Library association Carnegie medal was awarded to Agnes Allen for *The Story of Your Home*. *The Wind in the Willows* was reprinted with striking illustrations by Arthur Rackham.

Welcome additions to the small number of suitable titles for adolescents were *The Years of Grace*, edited by Noel Streatfeild, covering the problems and interests of girls; *The Lark on the Wing*, a sensitive study of a girl singer, by Elfrida Vipont; and *A Dream of Sadler's Wells*, a story of ballet by Lorna Hill. Biographical works included *Elizabeth Fry*, written with fine perception by Kitty Barne; a straightforward account of *Florence Nightingale* by Lucy Seymer; a discerning portrait of *Hudson of*

*Hudson's Bay* by the explorer J. M. Scott; and *Marco Polo*, written in adult style by Maurice Collis. *Going to the Ballet* by Arnold Haskell and *Going to a Concert* by Arthur Salter were expertly written introductions.

Interesting contributions to factual literature included *The Story of the Highway* by Agnes Allen and *The Musical Detectives* by Irene Gass and R. J. McGregor, both written within a fictional framework; *The Book of Flags* by Gordon Campbell and I. O. Evans, with excellent illustrations; and *John and Mary's Aunt*, personal recollections of a girlhood in Japan, told with charming simplicity by Grace James. Practical advice on popular hobbies was given in the "Junior Teach Yourself Series."

Poetry was represented by *The Wandering Moon* by James Reeves and, in freer style, by Ian Serraillier's *The Tale of the Monster Horse*. Adventures from the *Odyssey* were retold by Aubrey de Sélincourt in *Odysseus the Wanderer*.

Foremost among several historical stories with good characterization and feeling for locality as well as period was *The Secret Fortress*, by Joyce Reason, a vigorous tale of the Northmen during the reign of William I. Adventures at the time of Trafalgar were skilfully narrated by John Keir Cross in *Blackadder*; Kathleen Fidler chose an unusual theme in *I Rode with the Covenanters* and Philip Woodruff took liberties with history in *Hernshaw Castle*. In gentler vein were *The Queen Elizabeth Story* and *The Chronicles of Robin Hood* by Rosemary Sutcliffe and *The Five Wishes*, a Victorian chronicle by Dorothy Stuart.

Outstanding adventure stories of traditional pattern were *The City of Frozen Fire* by Vaughan Wilkins and *Cocos Gold* by Ralph Hammond, with *There Is No Escape* by Ian Serraillier and *Saturday Adventure* by John Pudney in modern idiom. Psychology was predominant in Richard Church's *The Cave*, science in Donald Suddaby's *The Star Raiders* and the sea in Andrian Seligman's *Thunder Reef*. *The Islanders* was a satisfying tale of open-air life by Roland Pertwee. Africa was sympathetically depicted in *African Boy* by Grace Huxtable and *Salifu the Detective* by C. J. Neville; Australia in *Bush Voyage* by Stephen Fennimore; tsarist Russia in *A Boy in Samarkand* by George Sava; a U.S. lumber town in *North Fork* by Doris Gates; and English and Italian scenes in *Giovanna and Jane* by Iris Origo.

Among fantasies were *The Big House* by Naomi Mitchison and *The Lion, the Witch and the Wardrobe* by C. S. Lewis, both of unusual depth and imagination; *Finn Family Moomintroll*, by Tove Jansson, translated from the Swedish; and *The Wonderful Stranger*, by Roger Lancelyn Green. There was delicate charm in *Don't Go Out of Sight*, *Miranda* by Elizabeth Gorell and *The Cats and Rosemary* by Frank Swinnerton; homely fairy stories in *The Seventh Pig* by Patricia Lynch and *The Cobbler's Shop* by Alison Uttley; originality in *Galloping Fred* by Antonia Ridge; humour and invention in *The Adventures of Chunky* by Leila Berg; and solemn absurdity from the United States in *The Twenty-One Balloons* by William Pène du Bois.

*The White Riders* by Monica Edwards, *The House in Hiding* by Elinor Lyon, *Under Black Banner* by Geoffrey Trease and *Roly's Dogs* by Kitty Barne were pleasantly readable tales with good local colour.

There was sparkling fun and pathos in *Lottie and Lisa* by Erich Kästner and imaginative use of colour in *A Bell for Ursli* by Selina Chönoz, both translated from the German. *Sandy the Red Deer*, a nature story by F. Fraser Darling, was notable for its good prose style. (D. D. Ct.)

**Child Welfare.** International Services.—Steps toward enactment of a Declaration of the Rights of the Child were taken within the United Nations during 1950. A draft declaration, after amendment and approval by the Social commission, was submitted to the Economic and Social council,

with the request that the council after consultation with the Commission on Human Rights transmit it to the general assembly.

There was general recognition of the need for such an instrument in addition to the Universal Declaration of Human Rights, approved in Dec. 1948. In stating the broad principles regarding rights of the child toward which all nations should strive, the draft declaration pointed to parallel concepts of individual rights and obligations toward society and emphasized protection against factors likely to foster discrimination. It specified the rights of a child to a name, nationality, security, health, education and protection against such exploitation as might prejudice his development.

The United Nations International Children's Emergency fund (U.N.I.C.E.F.) by action of the general assembly of the U.N. on Dec. 1, 1950, was continued for another three years with the presumption that in 1953 it would be made permanent. The fund completed the first phase of its operations dating from 1946, in which it provided the equivalent of \$150,000,000 mostly in food, clothing, health supplies and services to children in war-devastated countries. The second phase would emphasize the continuing needs of children in countries of limited economic development, strengthening wherever possible the permanent child health and child welfare programs of the countries receiving assistance, and still taking into account the needs which were decreasing in most war-devastated countries.

The support of U.N.I.C.E.F. came from 48 countries, including voluntary contributions as well as governmental appropriations. Efforts of some of the small or newly constituted countries, as in previous years, were remarkable, the 1950 contributions including \$60,000 from Iceland, \$367,000 (in rice) from Thailand, \$100,000 from Indonesia and \$120,000 from west Germany.

Allocations late in 1950, illustrative of the program of U.N.I.C.E.F., included \$2,532,000 to nine Asiatic countries—Burma, Ceylon, India, Indonesia, Japan, Pakistan, Philippines, Thailand and Malaya—and a new allocation of \$500,000 to Korea to replace funds previously provided for maternal and child health projects but used instead for emergency relief supplies. The \$840,000 allocated to Latin America was added to the area reserve, and from existing reserves \$528,000 was apportioned for projects in nine countries—Chile, Colombia, Costa Rica, Dominican Republic, Ecuador, El Salvador, Honduras, Nicaragua and Paraguay. Funds in excess of \$500,000 were made available for health services and relief in the middle east, \$350,000 for Bacillus-Calmette Guérin (BCG) antituberculosis vaccination campaigns and \$150,000 (previously allocated) for an antibelzsyphilis campaign in Iraq. Child-feeding programs in Israel and Palestine, with other relief for Palestine refugees were made possible mostly by previous allocations for the first half of 1951. The work in Europe included allocations of \$185,000 to Greece and \$586,000 to Yugoslavia for food supplies required through the early months of 1951 for aiding 1,000,000 children in Greece and 1,400,000 in Yugoslavia, some of whom otherwise might not have survived the drought of 1950. Other allocations included \$25,000 to Germany to aid handicapped children and \$56,000 to cover part of the cost of training, in Sweden and the United Kingdom, the workers serving handicapped children in various European countries aided by previous as well as the current allocations.

The World Health organization (W.H.O.), as in previous years, gave priority to children in much of the work for which it was responsible or for which it shared responsibility. Its membership in 1950 consisted of 75 countries. It co-operated with U.N.I.C.E.F., the Food and Agricultural organization (F.A.O.) and various national agencies in efforts combating those diseases which claim many victims among children in devastated and un-

FASCINATED BY A DOLL almost half her own size, an orphan of Rome, Italy, is shown leaning forward for closer inspection. The dolls and other toys shown were among the first 1950 shipment of playthings for European orphans collected and sent by the American Legion

derdeveloped countries and immobilize through illness large parts of the world's population. Teams of trained health workers, including public health engineers, helped many countries reduce the incidence of malaria. This disease, tuberculosis and venereal diseases, recognized as the world's greatest public health enemies, received foremost attention. Plague, cholera, trachoma, yaws and smallpox also were reduced in countries where their control was most needed. In much of this work W.H.O. provided technical advice and assistance and U.N.I.C.E.F. the supplies and equipment.

The operations of W.H.O., reorganized in 1950, were conducted by three divisions, public health services, communicable diseases, and professional and technical education. The W.H.O. budget for 1950 was about \$6,300,000 and the outlook for 1951 was for expenditure of about \$6,000,000. In both years the administration of W.H.O. had projected a larger budget but the limited resources required curtailments.

The maternal and child health section of W.H.O. developed a long-range program including: (1) stimulation of research and investigation of conditions affecting the well-being of children; (2) provision of technical information; (3) provision of expert advisers and demonstration teams to underdeveloped countries and other countries requesting them; (4) expansion of existing fellowship and training programs, including the training of nurses, nurses' aides, midwives, nutritionists, health educators and physicians; (5) instruction in mental health for all persons thus trained in maternal and child health; and (6) co-operation with U.N.I.C.E.F. in organization of maternity services and all

kinds of child health clinics, including clinics for handicapped children and child guidance clinics, and the extension of mass immunization campaigns.

Health services in the Americas are co-ordinated through the Pan American Sanitary bureau (P.A.S.B.), which was created in 1902 and became the W.H.O. regional office for the Americas in 1949. It administered 183 W.H.O. fellowships during the year ending May 1950. The P.A.S.B. serves as agent for most of its member countries in the procurement of medical and sanitary supplies and equipment. Its program in 1950 included co-operation with national health authorities in Mexico, Chile and Peru in training and educational programs against poliomyelitis.

The International Refugee organization (I.R.O.) closed or transferred to other bodies in 1950 most of the camps which it had been operating for a residue of the 1,500,000 homeless adults and children served by I.R.O. since 1947. In 1950 there was resettlement of many of the handicapped who previously had been considered ineligible for placement in families or for employment and for whom it was difficult to arrange immigration. Voluntary agencies, including the Cooperative for American Remittances to Europe (CARE), the Red Cross in Scandinavian countries and various religious organizations continued to provide services in behalf of children and adults. Some of these bodies aiding in the resettlement of refugees filled gaps left by reduction in the services of I.R.O.

International conferences in 1950 significant to the welfare of children included the third World Health assembly, Geneva, Switz., May 8 to 27, the fifth International Conference of Social Work, Paris, July 23 to 28, and the sixth International Congress of Pediatrics, Paris, July 23 to 28.

**National Developments.**—Latin American countries pro-

vided more initiative than in previous years in coping with age-old hazards to child health and in dealing with disasters, such as the 1949 earthquake in Ecuador, and in contributing to the world-wide health efforts of the United Nations and its specialized agencies. Construction was begun on Bolivia's first children's hospital. In the middle east development of social services for children in Israel, in fields of child care and child guidance, were in line with the best practice known. India, in the far east, made progress especially in the training of social workers, obtaining for this purpose outstanding instructors from other parts of the world.

The United States had about the same increase in the number of its children in 1950 as in the two previous years, with approximately 3,500,000 births. The development of educational, health and welfare facilities was not in proportion to this expansion of population.

The year was marked by the midcentury White House Conference on Children and Youth, held Dec. 3 to 7 in Washington, D.C., in which more than 5,000 persons, including professional workers, representatives of citizen groups and youth from all parts of the United States assembled "to consider how we can develop in children the mental, emotional and spiritual qualities essential to individual happiness and to responsible citizenship, and what physical, economic and social conditions are deemed necessary to this development."

Even more significant than the White House conference was the preceding fact-finding study in which state and local committees took stock of the child welfare needs and resources of their communities. Many of these state and local groups would be continued for purposes of planning in behalf of children in the following decade.

Health agencies and public health officials focused attention in 1950, as never before, on cerebral palsy and the possibilities of training children and youth thus handicapped. It was estimated that 150,000 children in the United States had cerebral palsy of such degree as to require service in special clinics and educational establishments.

Child health needs revealed by the 1949 report of a study by the American Academy of Pediatrics and co-operating agencies were widely publicized in 1950. Long-range planning by state, federal and voluntary organizations was aimed at improvement of facilities for education of more nurses and for extension of training in pediatrics, both for specialists and those engaged in the general practice of medicine.

The latter part of 1950 saw marked increase in the employment of women, including many mothers, with a consequent increase in the demand for day care. The number of preschool children in the United States being greater in 1950 than in 1941, there were more under six years of age for whom day care might be needed. Thus with partial mobilization for defense under way the proportions of the day care problem bulked larger than at the beginning of World War II.

The Child Welfare League of America and several federal agencies began study of ways and means for reactivating much of the day care service discontinued during 1946 and 1947. But by the end of the year there were no substantial provisions for such expansion. Study showed, however, that under peacetime conditions few communities provided day care under governmental auspices and that even where such services or voluntary day care centres were operated they were too limited in capacity to meet the demand and usually were below standards set by licensing authorities.

Congressional revision of the Displaced Persons act, June 16, 1950, liberalized provisions for admission to the United States of certain European children. The Displaced Persons commission enlarged its staff to facilitate screening of children especially in

Germany, Greece and Italy. The changes in the law allowed substantial numbers to come from these and a few other countries under nonquota visas. Independent assurance given by families in the United States, if satisfactory to the commission, was the principal requirement preparatory to such immigration of orphans under 10 and certain orphans under 16 years of age. The Displaced Persons commission was co-operating with sectarian agencies, the United States Committee for the Care of European Children and the federal children's bureau to provide suitable safeguards.

Aid to dependent children, available under the Social Security act, was increased under an amendment enacted in 1950. Effective Oct. 1, the federal government allowed a supplement to previously authorized payments whereby there was recognition of the needs and expenses of the parent or other relative who maintained a home for the aided child. The additional amount thus authorized, up to \$27 monthly, would apply to about 560,000 families. Aid to dependent children in which the state contributions were supplemented by federal funds was the only nation-wide program providing aid to large numbers of children. The availability of this form of public assistance, since the passage of the Social Security act in 1935, had permitted millions of families to remain intact, many of which without such help would have found it necessary to have their children placed in foster homes or institutions. **Chile.** A republic extending along the southern Pacific coast of South America for about 2,600 mi., Chile has an average width of 110 mi. It is bounded on the north by Peru, on the south by the Antarctic ocean, on the east by Bolivia and Argentina and on the west by the Pacific ocean. It has an area of 286,323 sq.mi. and a population of 5,760,571 (Dec. 1949 est.). Santiago, the capital, has 1,161,633 inhabitants (Dec. 1949 est.). Other leading cities are Valparaíso with 198,068 inhabitants, Viña del Mar (98,156), Concepción (87,620), Antofagasta (47,326), Talca (44,859), Temuco (37,105), Iquique (34,864), Chillán (31,687) and Valdivia (30,308). Religion: Christian, mainly Roman Catholic. President in 1950: Gabriel González Videla.

**History.**—During 1950 Chile enacted a series of measures designed to contain inflation, bolster its dollar reserves, improve its economic life and encourage the industrialization of the country. The government tried to reach these objectives by curbing rents, avoiding profiteering, granting bonuses for urgently required imports, raising taxes, and lowering tariffs in order to encourage foreign trade.

Early in the year the government was faced with widespread strikes and disorders in the mining areas which forced it to declare a state of alert. Santiago and Valparaíso were left without newspapers and transportation. The banks and insurance companies were unable to operate normally. The "national concentration" cabinet, representing the major political forces in the country, resigned after 19 months in office and President González Videla threatened to appoint an all-military cabinet. Toward the end of February the strike situation was settled and a new cabinet, representing four political parties and with one independent, was appointed.

In April President González Videla visited the United States as a guest of Pres. Harry S. Truman. In addressing the United States congress González Videla explained why his administration had been forced to outlaw the Communist party. He said that the

Communists did not respect civil liberties and constituted a threat to the peace of the hemisphere.

During González Videla's absence the minister of the interior, Pedro Enrique Alfonso, acted as president. He announced that Chile would maintain its exchange rate of approximately 60 pesos to the dollar (decreed early in the year upon the recommendation of the International Monetary fund) and that foreign investors would receive special consideration in tax matters and guarantees of a fair return on their investments. This was part of the government program to encourage private capital investments in Chile.

Chilean economic recovery received a setback when the two cents per pound tariff on copper imports which the United States had temporarily suspended during World War II was reimposed in June. This would cost the copper industry an estimated \$5,000,000 a year, which, in addition to the drop of approximately seven cents a pound in the price of this metal during 1949, constituted a serious economic blow. Negotiations for a new commercial treaty with the United States were initiated.

The drop of \$12 to \$13 a ton in the price of synthetic nitrates complicated the economic situation still more, but partial compensation was found in the export of petroleum to Uruguay from the Springhill developments in the Straits of Magellan. A steel plant, the second largest in South America, was built in Huachipato near Concepción and the southern port of Talcahuano.

(J. McAd.)

**Education.**—In 1945 the public primary schools had 452,826 pupils and the private primary schools 93,185 pupils. Secondary schools had about 55,000 pupils. University education was available at the state university of Chile, the Catholic university of Santiago and the University of Concepción.

**Finance.**—The monetary unit is the peso, valued at \$0.0122 U.S. currency, free (nontrade) rate, on Oct. 31, 1950. The rate for imports into Chile was \$0.0322 (official), \$0.0232 (banking market), \$0.0166 (provisional commercial) or \$0.02, depending upon their relative importance to the economy. The 1951 budget, as submitted to congress, balanced revenue and expenditure at 21,200,000,000 pesos (1950 as enacted: 15,649,600,000 pesos). Actual revenue in 1949 was 15,823,200,000 pesos, and actual expenditure 15,415,800,000 pesos. The funded foreign debt totalled about \$215,000,000 on Dec. 31, 1949; the direct debt on Dec. 31, 1948, was 6,762,000,000 pesos plus guaranties of 1,397,000,000 pesos. Notes and coins in circulation on Sept. 30, 1950, totalled 5,629,000,000 pesos; gold reserve \$40,200,000; sight and current account deposits 11,426,000,000 pesos; time deposits 4,716,000,000 pesos; government deposits 1,761,000,000 pesos.

**Trade and Communications.**—Exports in 1949 amounted to 1,493,159,000 gold pesos (including bullion and specie); imports were 1,474,979,000 pesos. Leading exports were copper bars (50%), nitrate of soda (21%), cereals, vegetables and fruits (7%) and forest products (3%). Leading imports included industrial machinery and equipment (22%), oils, paints and chemicals (13%), metals and manufacturers (13%) and transport materials, including vehicles (10%). The principal customers were the U.S. (49%), the United Kingdom (8%) and France (8%); the principal suppliers, the U.S. (54%), Peru (10%) and the United Kingdom (8%).

The railway system totalled 5,434 mi. in 1949, of which 3,859 mi. were owned by the government and most of the remainder by the Antofagasta and Bolivia Railway Co., Ltd. Highways (Dec. 31, 1947) included 1,785 mi. of international highway, 3,815 mi. of national highway and 26,300 mi. of provincial roads. According to *Lloyd's Register of Shipping*, the merchant marine had 91 steamers and motorships (100 tons and over) aggregating 175,157 gross tons on June 30, 1949. There were 126,000 telephones in 1949.

**Agriculture.**—Production of the principal crops in the crop year 1949-50 was estimated as follows (in short tons): wheat 915,000; barley 88,000; oats 48,500; potatoes 500,000; maize 71,000; rice (paddy) 92,500. Fruits and vegetables were cultivated extensively. Production of wine totalled 91,977,000 U.S. gal. in 1948. Cattle numbered 2,344,188 in 1949. The last census of other livestock showed 5,749,069 sheep and 810,206 goats. Wool production averaged 17,000 short tons a year. Lumber production averaged about 275,000,000 bd.ft. a year, and landings of fish (including shellfish) about 70,000 short tons. The whale catch in 1948 produced 2,900 short tons of sperm oil and 2,000 tons of whale oil.

**Manufactures.**—Manufacturing establishments were reported to number 5,585 in 1948, with capital of 1,466,587,000 pesos and 296,000 employees. During 1949, the establishment of 482 new industrial enterprises was authorized. There were about 375 textile mills in 1950, including 43 cotton mills, 220 knitting mills and 46 silk and rayon mills. Production figures (1949) included woven cotton fabrics 29,750,000 yd.; wool yarn 400 short tons; cement 545,000 tons; pig iron 20,500 tons; steel in bars 34,750 tons. The index for manufacturing industries stood at 137 in Aug. 1950 (average 1949: 160) and employment in manufacturing was 134 (1937=100). Electric energy is used extensively; production in 1949 was 1,284,000,000 kw.hr. The cost of living index stood at 595 in July 1950 (1937=100).

**Mineral Production.**—Chile is the leading mineral-producing country

in South America. Production in 1949 included copper 409,057 short tons; nitrate of soda 1,947,187 tons; iron ore 3,017,836 tons; coal 2,289,135 tons; gold 179,630 troy ounces; silver 789,654 oz. In the first reported 12 months of commercial production (Oct. 1949-Sept. 1950), wells on Tierra del Fuego produced 68,660 metric tons (about 490,000 bbl.) of crude petroleum. (J. W. Mw.)

**China.** Situated on the southeastern part of the continent of Asia, China has an area of about 3,876,956 sq.mi. and 475,000,000 people (1950 official figure). After the inauguration of the Central People's government on Oct. 1, 1949, China was divided into the People's Republic under the Communists, controlling practically all China's mainland and Hainan and Chusan Islands, and the republic, under the nationalists, on Taiwan (Formosa).

Both the Central People's government in Peking and the national government in Taipei, Formosa, claimed to be the sole legal government for all China.

Shanghai, the largest city of China, had a population of 4,995,163 in 1950. The latest official figures available for the principal large cities were 1948 estimates: Peking 1,721,546; Tientsin 1,772,840; Canton 1,128,165; Nanking 1,113,972; Mukden 1,021,057; Chungking 985,673; Tsingtao 850,308; Harbin 760,000; Hankow 721,598; Sian 628,499; Dairen 543,690; Changchun about 500,000.

Mao Tse-tung (*q.v.*) was chairman of the Central People's government; Chiang Kai-shek (*q.v.*), president of the national government since March 1950.

**History.**—The year 1950 marked the culmination of the Communist revolution in China, the beginning of organizing China's society and economy in accordance with Marxian ideology and Mao's principle of new democracy, and avowed collaboration with the Soviet Union and animosity toward the western democracies. Despite floods and famine and the remaining resistance of the nationalists, the People's government succeeded in consolidating and extending its gain and control on China's mainland and in introducing and carrying out drastic measures—particularly in land reform, which were intended to change completely the social structure of old China. In international relations, while the national government's legal position as the sole representative of China was constantly challenged or ignored, the People's government received *de jure* recognition from several non-Communist countries and extended its influence far and wide. The policy of the People's government of siding with the Soviet Union in opposing the western powers and the question of China's representation in the United Nations brought repeated international crises. Particularly the Peking government's attempt to "liberate" Tibet by military force, open intervention in the battle of the North Koreans against the United Nations forces and complaints and activities against the United States policy in Formosa and Korea sharpened the division and tension between the east and the west and precipitated a major crisis in the United Nations.

A new international balance of power was created by the ratification on April 11, 1950, of the Sino-Soviet treaty of alliance and agreements on the Chinese Changchun railway, Port Arthur and Dairen, and on a credit loan of \$300,000,000 signed on Feb. 14 after the prolonged visit of Mao and his foreign minister Chou En-lai to Moscow. The Sino-Soviet treaty and agreements of 1950 invalidated that of Aug. 14, 1945, and were regarded by the nationalists as evidence of servitude to the U.S.S.R. but by Moscow and Peking as a "powerful safeguard for peace in the far east and the world." Among other things, the Sino-Soviet treaty of friendship, alliance and mutual assistance bound the high contracting parties not to take part in any coalition or actions or measures directed against each other but to consult each other in regard to all important international problems affecting their common interests. Subsequently other economic and trade agreements be-

tween Peking and Moscow were concluded. Important trade and economic agreements signed between the People's government and governments of other Communist countries of 1950 included the Sino-Czech trade agreement, the Sino-Korean communication agreements and the trade agreement between Peking and east Germany. In addition to India and Burma, which extended *de jure* recognition to the People's government in Dec. 1949, other non-Communist countries recognizing or establishing diplomatic relations with the Peking government in 1950 were: Afghanistan, Ceylon, Denmark, Finland, Israel, Indonesia, the Netherlands, Norway, Pakistan, Sweden, Switzerland and the United Kingdom. The British government offered *de jure* recognition to the People's government on Jan. 6 but by the end of 1950 no formal diplomatic relation had yet been established.

The United States policy toward China in 1950 more or less followed these lines: (1) no military aid to Formosa; and (2) withholding recognition of the People's government. On Jan. 4 it was reported that the state department had issued a directive saying that the fall of Formosa was anticipated. On the following day Pres. Harry S. Truman declared that the United States would not pursue a course which might lead it to involvement in China's civil war. On Jan. 14 the United States ordered the withdrawal of all consular personnel from China's mainland.

On June 5 President Truman signed the foreign aid bill which provided \$94,000,000 for aiding the people of "non-Communist China." To prevent the occupation of Formosa by Communist forces during the Korean conflict and to neutralize the position of Formosa, President Truman on June 27 ordered the 7th fleet to station in Formosan waters and requested the national government to cease all air and sea operations against the mainland. He further stated that "the determination of the future status of Formosa must await the restoration of security in the Pacific, a peace settlement with Japan, or consideration by the United Nations." In response to Truman's statement on Formosa both the national government and the People's government declared Formosa to be an integral part of China. The latter regarded the United States' prevention of the capture of Formosa as "an act of open aggression" and began in July to intensify its propaganda campaign directed against "American imperialism in Asia." In order to try to keep Peking out of the war in Korea Secretary of State Dean Acheson and President Truman declared on Aug. 30 and 31 respectively that the United States felt no hostility toward China and had no aggressive intention in the far east and that the 7th fleet would be withdrawn when the Korean conflict was settled. On Oct. 1, Chou En-lai flatly stated that China's army would aid Korea. Toward the end of October United Nations forces pressing toward the Manchurian frontiers encountered Chinese Communist troops, and two days after the U.N. troops opened their "end the war" offensive on Nov. 24, the Chinese Communists mounted strong attacks that halted their advance. Toward the end of 1950 all United Nations forces had been driven in retreat to south of the 38th parallel.

To "liberate" Tibet was one of the fundamental aims adopted by the People's government at its inception. On Jan. 21 it requested Tibet to send representatives to negotiate on a peaceful solution of the problem of Tibet's status. On Aug. 31 Peking informed New Delhi of its planned action and again requested the Tibet delegation in India awaiting visas to Hong Kong to rush to Peking. Early in October the People's Liberation army crossed the Tibetan border and shortly afterward the Indian government expressed regrets and concern. Tibet appealed to the United Nations and the El Salvador delegation formally proposed the inclusion of the question of Tibet on the agenda of the general assembly. However, it decided on Nov. 24 to postpone consideration of the matter. On Dec. 21 the Dalai Lama, spiritual and temporal ruler of Tibet, fled from Lhasa to Yatung in south Tibet.

"WITHOUT FACE," a cartoon by Costello of the *Knickerbocker News* (Albany, N.Y.), published in 1950

Despite the questions of Tibet and Korea, India remained an advocate of the Peking government's admission into the United Nations.

Lack of unity on far eastern problems among the powers presented an impasse on the question of China's representation in the United Nations and hampered United Nations efforts to reach a solution to the problem of Korea. On Jan. 8 the Peking government began to demand the ousting of the nationalist delegation from the United Nations and on Jan. 13 the soviet delegation quit the Security council after the latter had rejected the soviet proposal against the continued membership of nationalist China. Consequently the soviet delegation boycotted practically all United Nations organs. The Security council adopted its resolutions on June 27 and July 7 applying military sanctions against North Korea and the soviet delegation resumed its seat on the council on Aug. 1. In the subsequent debates in the United Nations the questions of China's representation and Korea were linked.

Early in 1950 the United States had declared that it was opposed to the admission of Communist China into the United Nations but that it would not veto such a decision by the Security council were there the necessary majority. Following the Security council's action on Korea the United States maintained that the question of China's representation and the issue of Korea should be kept apart. The United States opposed the proposal that Communist China be admitted as the first step to halt the war in Korea. Giving no excuse for the Chinese Communists to intervene in Korea, the United Nations command turned down the offer of the nationalists to send 33,000 troops to join United Nations forces in Korea. On the opening day of the general assembly on Sept. 19 India and the Soviet Union moved to seat Peking but their resolutions supported by the 16 member states

recognizing the Peking government were voted down by 33 states. Over the objection of the soviet and Chinese nationalist delegations the general assembly decided on Oct. 5 to include the United States proposal of Sept. 21 on the problem of Formosa on its agenda. On Nov. 11 the Peking government turned down the invitation of the Security council to send a representative to explain its action in Korea but agreed to send a delegation to discuss its charge of "American aggression" against Formosa. The prepared statement by Wu Hsiu-chuan, representative of the People's government, before the Security council shattered all hope for an independent policy by Peking and a workable solution to the Korean crisis by the council. A six-power resolution ordering the Chinese forces out of Korea was vetoed by the soviet delegation and the matter was referred to the general assembly.

The crisis brought Prime Minister Clement R. Attlee to Washington, D.C., in early December and in a joint communiqué issued on Dec. 8 Truman and Attlee assured the Peking government once again that their legitimate interests both in Korea and elsewhere would be safeguarded. Despite their disagreement on the question of Formosa and on recognition and admission of the People's government into the United Nations, they stated that both the United States and the United Kingdom were ready to seek an end to the hostilities by means of negotiation. On Dec. 14 the general assembly approved a resolution establishing a committee to seek a cease-fire, made by Asian and Arab countries under the leadership of India's representative. Before Wu left on Dec. 19 for Peking he stated Peking's conditions for a cease-fire to be as follows: (1) admission of the People's government into the United Nations; (2) withdrawal of the 7th fleet from Formosan waters; (3) immediate evacuation of United Nations forces from Korea. On Dec. 23 the Peking government formally replied to the general assembly in a cablegram denouncing its truce team as illegal and reiterating Peking's terms for peace. By the end of 1950 it was evident that the Communist forces were ready to cross the 38th parallel. (See also COMMUNISM; FORMOSA; INDIA; KOREA; KOREAN WAR; TIBET; UNION OF SOVIET SOCIALIST REPUBLICS; UNITED NATIONS.)

**Education.**—On China's mainland emphasis was laid on the inculcation of the new ideology and the training of technical personnel to serve the people. Excluding institutions of higher learning in Formosa, there were

227 colleges and universities, 138 of which were public, on the mainland with about 140,000 students. Official 1950 figures for other schools on the mainland were: about 5,000 secondary schools with more than 1,500,000 students and 300,000 primary schools with more than 20,000,000 pupils.

**Defense.**—1950 estimates of the nationalist forces on Formosa varied between 500,000 and 750,000, of which 200,000 were believed to be well trained and equipped. The national government maintained also a navy of about 100 small vessels with about 45,000 men and an air force of approximately 200 planes with about 25,000 men. Military expenditure occupied the greater part of the nationalist budget. The Communist army totalled about 5,000,000 men equipped with a conglomeration of old and new weapons of Japanese, U.S. and Russian origin. The backbone of the Communist air force, estimated at 200-300 planes, was soviet-built jet planes. Military expenditure occupied more than 38% of the Peking government's budget for 1950. Compulsory military service was enforced in Formosa and on the mainland.

**Finance.**—To check inflation and to control and balance the budget, the Peking government adopted early in 1950 a centralized system of finance, a unified system of tax rate and collection, and a centralized control of economy. All revenues from public grain, customs duties and taxes were put solely at the disposal of the ministry of finance and all expenditure was to be paid by it. Government expenditure was cut to a minimum. The relative price stability tended to support the Peking government's claim that the 1950 budget would be balanced without the estimated deficit. About four-fifths of the total expenditure was to be covered by current revenue, of which 41% was from land tax, 39% from other taxes and 17% from revenue of state enterprises. Only percentage figures for expenditure and revenue were available and the unofficial estimate put the 1950 total budget at U.S. \$900,000,000. The exchange rate of the People's bank dollar was about 35,000 to the U.S. dollar.

A large budget deficit remained with the national government. Unofficial sources estimated its monthly expenditure as more than U.S. \$10,000,000 and revenue could meet only a small portion of this amount. Economic Cooperation Administration aid contributed about \$3,000,000 a month to Formosa's economy. Inflation continued and in Dec. 1949 the note of issue by the Bank of Formosa reached F\$194,000,000 only F\$6,000,000 short of the official currency issue limit of F\$200,000,000. On Dec. 30 the Formosa dollar depreciated to 13 to U.S. \$1 at open-market rate.

**Trade and Communication.**—Trade throughout the mainland was put under the control of the ministry of trade and in March 12 major state companies dealing with domestic and foreign trade were set up to regulate China's economy. To control foreign trade the Peking government also established monopolies for the leading exports and itself handled the major import items. Imports were divided into: (1) permitted to import; (2) prohibited; (3) with special permission. General and normal rates of duties were applied to commodities imported from countries which had concluded trade agreements with the Peking government and higher rates of duties were levied on nonessential and luxury commodities and goods imported from countries which had no treaty or agreement with Peking. To retaliate against the measures adopted by the United States on Dec. 16 to freeze Peking's assets in the U.S. and to prohibit U.S. ships from calling at ports of the China mainland, the Peking government ordered on Dec. 28 the seizure of all U.S. properties and the freezing of all U.S. public and private bank deposits in Communist China. The official figure gave the first half of 1950 total foreign trade value of China's mainland as more than nine trillion People's bank dollars, or U.S. \$262,000,000 at July's official exchange rate of about 34,000 to 1. It was also claimed that the six months' favourable balance of trade amounted to U.S. \$38,000,000.

Including lines in Manchuria, Formosa and Hainan, the total length of China's railways was about 16,000 mi. With the reopening of the Peking-Hankow-Canton railway to traffic on Jan. 1, all trunk lines south of

**CHINESE COMMUNIST ASSAULT** troops invading the beaches of Hainan Island off the southern coast of China in April 1950. The nationalist government announced its abandonment of the island on May 3

the Great Wall were also restored. The Peking government's railroad program for 1950 included the increase of freight traffic to 96,941,987 metric tons, or twice that of the previous year, and the doubling of the passenger traffic. War destroyed or damaged about three-fourths of China's highways totalling about 120,000 mi. The Peking government planned to repair more than 10,000 mi. of highway in 1950. About 80% of China's prewar telephone and telegraphic lines were opened.

**Agriculture, Manufactures, Mineral Production.**—The Peking government claimed that land reform had resulted in the increase of agricultural production and that China was self-sufficient in food and cotton supplies in 1950. Land reform was to proceed by carefully planned stages in areas where conditions were favourable, and had been completed in an area with about 160,000,000 population. In June a new agrarian reform law was adopted protecting the land and properties owned by rich and middle-class peasants from infringement. In industry the Peking government concentrated its efforts on building Manchuria as China's industrial centre and in shifting some industries to the northwest. The tables show the general trend of agricultural and industrial production of China.

Table I.—Estimated Production of Major Industries and Mining in China

Unit	(In thousands of metric tons)			1935-39 average

(H. T. CH.)

**Ching, Cyrus Stuart** (1876– ), U.S. government official and labour-relations expert, was born May 21 in Prince Edward Island, Can. He attended Prince of Wales college at Charlottetown, and the Charlotte-town Business college, but moved to Boston, Mass., in 1900, where he went to work for the Boston Elevated railroad. He continued his studies at Northeastern university, Boston, where he received a law degree, and was admitted to the Massachusetts bar in 1912. As assistant to the railway company president in charge of labour relations, he began the policy of voluntary conciliation between management and labour that he later frequently declared to be the most effective way to keep labour peace. In 1919 he became supervisor of industrial relations of the United States Rubber company, and its director of industrial and public relations in 1929. In 1933 he was appointed to the National Regional Labor board under the National Recovery administration (NRA). In 1941 Pres. F. D. Roosevelt appointed him to the National Defense Mediation board, and during World War II he also acted as chairman of the Office of Production Management (OPM) committee to convert the automotive industry to war production. He served as industry member of the National War Labor board. In Sept. 1947, he was appointed chief of the Federal Mediation and Conciliation service. On Oct. 10, 1950, Pres. Harry S. Truman appointed him chairman of the nine-member Wage Stabilization board of the Economic Stabilization agency, on leave from the mediation and conciliation post. He was sworn in Nov. 28, 1950.

**Chloromycetin:** see CHEMOTHERAPY; MEDICINE.

**Chou En-lai** (1898– ), premier and foreign minister of the Communist People's Republic of China, was born in Huaiyin, Kiangsu province. As early as 1919 he was imprisoned for agitating among students. In March 1927 he helped organize a revolutionary government in Shanghai, but fled when Chiang Kai-shek ordered the arrest of the ringleaders. Chou next helped organize the Chinese Red army. In the struggles against Japan, Chou tried to maintain a united front between the Chinese Reds and Chiang's forces, even (in 1936) helping effect Chiang's release after the latter was kidnapped. In 1946-47 he was the Communist representative in talks with U.S. Gen. George C. Marshall, when the latter sought in vain to end the Chinese civil war. When the Communists won control of China in 1949, Chou on Oct. 1 was named premier and foreign minister of the new People's (Communist) Republic. In Jan. 1950 he went to Moscow to join in negotiations which resulted in the announcement of a 30-year mutual defense and friendship treaty. Chou was spokesman against the U.S. neutralization of Formosa, and voiced the threat (Oct. 1) that the Chinese Communist forces would not stand aside if "the imperialists" invaded North Korea. On Dec. 22 he rejected U.N. requests for cease fire talks until (1) U.N. troops were withdrawn from Korea, (2) U.S. forces were withdrawn from Formosa and (3) Chinese Communist government delegates were given seats in the U.N.

**Christian Science.** Christian Science is a religion founded and established by Mary Baker Eddy.

It is represented by the Mother Church, the First Church of Christ, Scientist, in Boston, Mass., and in 1950 had approximately 3,030 branches located throughout the world. There were also 112 college and university Christian Science organizations founded in accordance with the by-laws of the Mother Church.

The year 1950 marked the 75th anniversary of the publication of the Christian Science textbook, *Science and Health with Key to the Scriptures*, which was published in 1875. This textbook is used in conjunction with the Bible at all Christian Science services.

The Wartime Activities committee continued its service, which was increased because of the hostilities in Korea. Foodstuffs and clothing amounting to more than \$200,000 were supplied during the year to overseas countries. This was in addition to that which was contributed by individual branch churches and individual Christian Scientists.

The work of the Christian Science Camp Welfare Activities was intensified because of the war. Christian Science chaplains were serving with the armed forces in addition to volunteer workers.

This branch of the work of the Christian Science movement was accelerated as the demand for chaplains to serve in the war zone increased.

The church rendered prompt and effectual aid to victims of the flood in Winnipeg, Man., Canada.

The Christian Science Publishing society reported that during 1950 the circulation of all its periodicals, the *Christian Science Journal*, the *Christian Science Sentinel*, the *Christian Science Quarterly*, the *Herald of Christian Science*, which are published in seven foreign languages, and the *Christian Science Monitor*, reached the highest levels since their founding.

Edmund Stevens, chief of the Mediterranean news bureau of the *Monitor*, was awarded the 1950 Pulitzer prize for distinguished reporting on international affairs in his series, "This Is Russia—Uncensored," published in the *Monitor*. (See PULITZER PRIZES.)

The transcribed programs prepared in the Mother Church were broadcast over more than 550 radio stations in the United States and its territories, and in Canada, Panamá, Cuba, Bermuda, New Zealand, Australia, Bahama Islands and Luxembourg. (GE. C.)

**Christian Unity.** A striking example of unity in American interchurch effort was the 1950 United Evangelistic Advance shared by 35 denominations with 35,000,000 members. A million and a half laymen and laywomen invited neighbours to become church members. About 3,000,000 members joined. More than 6,000 new congregations were formed, an average of two a day in the Methodist communion alone.

Three events of major importance—two (international) in Toronto, Canada, and one (national) in Cleveland, O., demonstrated growing consciousness of community among the majority of Anglican, Orthodox and Protestant churches.

In July the World Council of Churches brought its central committee from many lands to Toronto. The delegates faced common problems with determination and proved the will of the churches to stay together. World-wide advances in practical co-operation were reported.

(For an account of the other Toronto event, see RELIGIOUS EDUCATION.)

In December, a quarter of a century of progress culminated at Cleveland in the uniting of 12 formerly autonomous interchurch bodies representing more than 32,000,000 of the 45,000,000 non-Roman Catholic Christians in the United States. The new National Council of the Churches of Christ in the U.S.A. elected Bishop Henry K. Sherrill as its head with S. M. Cavert as its general secretary and R. G. Ross as associate. Twenty-nine Anglican, Orthodox and Protestant bodies jointly achieved this new interdenominational structure. The newly launched *Protestant World*, also born in 1950, described the resulting body as "an organism through which common planning and action might be carried out in the realm of common responsibility and by means of which there might be the sharing of cooperatively created resources and services."

The presence there, among the speakers, of leaders of the World Council of Churches, officially representing virtually the same United States churches and 130 others throughout 45 other nations, emphasized the close co-operation which was contemplated between national and the international combination of non-Roman Catholic Christian churches. Nothing like this degree of voluntary co-operation between them had ever existed before.

The strength of such united effort was illustrated in the fact that the joint World council-International Missionary council Commission of the Churches on International Affairs in 1950 successfully advocated to the United Nations the creation of Peace Observation commissions to deter aggression.

There was in 1950, however, less progress than in most recent years in organic church union. Up to 1950 there had been achieved somewhere in the world on the average at least one organic union every year. The year saw two notable disappointments or deferrals of what had been heralded as assured mergers.

A few hundred congregations among the more than 5,000 composing the Congregational Christian General council blocked through court action a merger with the Evangelical and Reformed Church. The United Presbyterian and the Reformed (formerly Dutch) Church in America failed to achieve an anticipated merger. American (formerly Northern) Baptists and Disciples continued conversations looking to possible union but no concrete progress was reported.

The same was true of the two major U.S. Presbyterian bodies—popularly known as "Northern" and "Southern." Hope for further consolidation among Lutheran bodies in America was

likewise deferred. In contrast, the discussions of union involving Unitarians and Universalists were definitely promising.

Only slight progress was reported from northern India and Ceylon, in both of which areas comprehensive mergers were under consideration after the pattern set by the South India United Church. The latter body, with Anglican, Congregational, Methodist and other Protestant elements merged several years before, constituted the largest non-Roman Catholic church in Asia and the only one in the world containing such diverse elements. There appeared to be possibilities of further accessions to this latter union.

Renewed conversations went on in England between the Anglican and the Free Churches in exploration of proposals of intercommunion and the individual adoption of episcopacy as set forth by the archbishop of Canterbury. A report on the progress of conversations appeared toward the end of the year and was itself under vigorous discussion.

At least two events of the year appeared certain to influence Catholic-Protestant relations: A significant change occurred in official Roman attitudes toward conversations with non-Catholics on matters of faith. The Sacred Congregation permitted bishops to arrange discussions of religious reunion with other Christians. This was commended by many Protestant leaders. The other event, which caused a widespread unfavourable reaction among non-Catholics was the promulgation of the dogma of the bodily assumption of the Virgin Mary which set contemporary Rome still further apart theologically from all Protestantism, including Anglicanism, which had been more favourably inclined to cultivate closer relations with Rome than any other of the non-Catholic churches.

Conversations looking toward closer relations among Eastern Orthodox bodies in the U.S. were continued. Progress in Orthodox relations was shown by a significant experiment in theological education for priests of the U.S. branches of most of the larger Eastern communions. This was developing rapidly at St. Vladimir's Orthodox Seminary and Academy in New York city. The goal of many forward-looking leaders of these bodies—Russian, Serbian, Rumanian, Ukrainian, etc.—was a United Orthodox Church in America. The problems to be overcome were not theological but ethnic, cultural and nationalistic.

Seven more or less similar Protestant bodies which in late 1949 formed a permanent Commission on Christian Union at Greenwich, Conn., completed during the year a definite plan of organic merger to be considered in early 1951 at Cincinnati, O. Many of these same communions, plus Anglicans, held conversations in Canada and Australia. Little resulted in 1950.

The defections which had been taking place from the Kyodan, or United Church of Christ in Japan (which represents a merger under some compulsion during World War II of all non-Roman Catholic churches in the country) had apparently ceased, leaving that body still the strongest and most representative in its potential constituency with a remarkable record of growth in 1950 (14% in membership and 100% in contributions).

The interdenominational postwar Evangelische Kirche in Deutschland (E.K.I.D.—Evangelical Church in Germany), despite serious strains, held together even across the frontier which cuts off east from west Germany, and a more inclusive council of all Protestant bodies in Germany for common planning continued to function. The E.K.I.D., in a meeting in Berlin in December, issued a notable declaration of unity and denounced in bold terms the efforts of the Communists to domesticate and divide the churches.

No notable developments were reported from other parts of the world in the matter of mergers, although co-operative unity of the federal type advanced almost everywhere. (See also RELIGION.) (H. S. LR.)

**Chromium and Chromite:** see MINERAL AND METAL PRODUCTION AND PRICES.

**Chronology:** see CALENDAR OF EVENTS, 1950, pages 1-16.

**Churchill, Winston Leonard Spencer** (1874- ), British statesman, was born at Blenheim palace, Oxfordshire, Eng., on Nov. 30. For his biography and political career during World Wars I and II, see *Encyclopædia Britannica*. After the defeat of his government in the general election of 1945 he led the Conservative opposition in the house of commons.

Winston Churchill's preparations for the general election of Feb. 23, 1950, included broadcasts on Jan. 21 and Feb. 17. In the election, the Conservatives and their supporters were again defeated but by a small margin; the Conservative leader was

"SHADOW AND SUBSTANCE," an illustration by the British cartoonist Vicky, from "Up the Poll!"—*The Sap's Guide to the General Election*, published in London in 1950

returned at Woodford and continued to lead the opposition. At the consultative assembly of the Council of Europe at Strasbourg on Aug. 11, his proposal for the creation of a European army was approved by 89 votes to 5 with 27 abstentions. In a broadcast on Aug. 26 he again gave a warning that Great Britain was in great danger through unpreparedness in defense matters but said that he did not believe a major war to be imminent. On Oct. 1 he celebrated the 50th anniversary of his first election to parliament.

**Church Membership.** The latest information concerning church membership in 56 religious bodies in the United States, each reporting more than 50,000 members, was that published by the *Christian Herald*, New York, N.Y., in July 1950. (see Table I). The total given for continental U.S. was 79,814,775 members, mainly for years ending in 1949, compared with 77,587,690 members reported by the same bodies the year previously. Some religious bodies do not compile and publish figures annually. In a few instances the latest data in the table are for the year 1936, the date of the last census of religious bodies taken by the federal bureau of the census. According to the official reports of the statisticians of the religious bodies, total church membership had been increasing for many years.

Church membership figures published in 1949 and 1950 represented the highest proportion of the total population ever reported in the religious bodies.

The Church of Christ, Scientist, is not included because the manual of that body forbids the numbering of the people and the reporting of such statistics for publication. The figure for the Disciples of Christ, as given for 1949, is a correction of the one previously published. The figure for the Religious Society of Friends is for all Friends' denominations. The name of the Northern Baptist Convention was changed to American Baptist Convention in 1950.

Table I.—Church Membership in Continental United States, as Reported in 1950, for the Religious Bodies with More than 50,000 Members

Body	Members 1950	Members 1949

\*A merger of the Evangelical Church and the United Brethren in Christ, Nov. 1946.

†Name changed from Norwegian Lutheran Church.

‡As of 1936.

The religious bodies having more than 50,000 members had 97.4% of all the church members in continental United States, according to a compilation of the reports of 256 religious bodies published in the *Yearbook of American Churches* (1945). The remaining 2.6% of the members were in more than 200 bodies. Of the total reported church membership in 1945, 32.3% was Roman Catholic, 1.3% Old Catholic, Polish Catholic and Eastern Orthodox, 6.4% Jewish and 60% Protestant. In 1945, mainly for the year ending in 1944, there were reported by 256 religious bodies 72,492,669 members, of whom 59,717,181 were 13 years of age or over. The *Christian Herald* estimated total church membership at 81,862,328 persons in 1950. (B. Y. L.)

\*Includes all Jews whether or not members of a synagogue.

†The great increase over the figure for 1949 does not reflect a marked growth but the correction of a mechanical error in computing the European Catholic population. This correction also affected the total Catholic and total Christian figures.

‡This figure includes Asiatic U.S.S.R. and Turkey.

§Includes Indonesia, but not the Philippine Islands.

||Includes the Philippine Islands.

(Table prepared by Charles S. Braden.)

religions are only very rough approximations. Aside from Christianity, few, if any, religions attempt to keep statistical records; and even Protestants and Catholics employ different methods of counting members. All persons of whatever age who have received baptism in the Catholic Church are counted as members, while in most Protestant Churches only those who join the church are numbered. The compiling of statistics is further complicated by the fact that in China one may be at the same time a Confucian, a Taoist and a Buddhist. In Japan, one may be both a Buddhist and a Shintoist.

**Civil Aeronautics Administration.** During 1950 there was an improvement in the U.S. domestic air-line safety record, but the international and combined records did not equal those set in 1949. There was a decided increase in the number of revenue passenger miles, both domestic and international, but a decline in the number of all types of pilot certificates issued and in the number of civil aircraft manufactured.

The combined accident fatality rate in 1949 for every 100,000,000 passenger miles of domestic and international flying by the scheduled air carriers was 1.0, the lowest in history. The estimated 1950 combined fatality rate was 1.4. In domestic operations, the estimated fatality rate was 1.2, compared with 1.3 in 1949. In international operations, the rate increased from 0 in 1949 to an estimated 2.1 in 1950.

Revenue passenger miles flown by domestic and international scheduled carriers increased 15%, from 8,806,576,000 in 1949 to an estimated 10,115,000,000 in 1950.

Ton-miles of freight carried by both domestic and international scheduled carriers increased by an estimated 33% and ton-miles of express by an estimated 5%. Freight carried in international operations increased by an estimated 131%.

The total number of private, commercial and air-line transport pilots increased from 525,174 as of Dec. 13, 1949, to an estimated 550,000 as of Dec. 31, 1950. During 1950 an estimated 45,400 student pilot certificates were issued, a drop of 8% from 1949. Private certificate issuances totalling an estimated 25,000 were less by 17%; commercial certificate issuances totalling an estimated 5,030 were fewer by 29% and air-line transport pilot certificate issuances numbering an estimated 800 were less by

25%.

Under the Federal Air Airport program, as of Dec. 31, 1950, in the fifth fiscal year of the 12-year program, the administrator had entered into grant agreements for 1,605 projects at 974 locations, involving approximately \$132,700,000 in federal funds and an estimated \$142,400,000 in sponsors' funds.

Progress continued in implementing the important common system of air traffic control and navigation for all users of air space — military, commercial and private. As of Dec. 1, 284 of

the approximately 400 very high-frequency omnidirectional radio ranges (VOR) required to cover the United States, and 96 instrument landing systems (ILS) had been fully commissioned.

Radar was coming into wider use in civil aviation. Airport surveillance radar was purchased for use at 54 airports having high traffic density. Precision approach radar was contracted for in order to supplement the surveillance equipment at 22 airports. The two types of radar, used together, constitute a ground controlled approach system, or GCA. Seven such installations were operating at New York LaGuardia, Chicago Midway, Washington National, Boston Logan, Atlanta, Cleveland and Los Angeles International airports.

The agricultural aeroplane prototype developed at Texas A. & M. college, College Station, Tex., under sponsorship of the CAA and the department of agriculture, in co-operation with the National Flying Farmers association and other organizations, was successfully flight tested on Dec. 1, 1950. Firms engaged in industrial flying operations numbered approximately 2,000, performing such activities as dusting, spraying, seeding and patrolling.

In the technical field, investigations of baggage compartment and power plant fire hazards were conducted. The first experimental self-sealing, break-away fuel line coupling, to prevent fuel spillage in the event of a crash, was developed and tested.

More than 20 instrument landing systems had been installed in the European area, and periodic checks were being performed by the CAA crew at the invitation of the governments concerned. The first instrument landing system in Central and South America was included in the facilities at the new airport at Buenos Aires.

The CAA assisted materially in establishing the civilian airlift operations across the Pacific to the Korean theatre. CAA's communications system was integrated with the military provisions for defense of the coastlines and northern boundary and atomic energy manufacturing areas to assure recognition and control of all civilian flights over strategic areas. (See also AIRCRAFT MANUFACTURE; AIRPORTS AND FLYING FIELDS; AVIATION, CIVIL.)

(D. W. N.)

**Civil Defense, U.S.:** see ATOMIC ENERGY.

**Civil Service.** United States.—Government services in the United States felt the influence of growing world tension and the initial impact of national mobilization during 1950. In the federal service, civilian employment began a steady climb as the staffs of defense agencies were built up. Draft calls of the armed forces, coupled with increased industrial tempo, foreshadowed manpower shortages as the year came to a close.

At the beginning of 1950, employment in the executive branch of the federal service stood at 1,950,000. A large temporary work force of census employees swelled this total during the spring, but subsequent cutbacks in the activity were more than offset when hostilities in Korea spurred the expansion of the national defense program. At year-end federal civilian employment was approaching 2,200,000. By comparison, state and municipal employment levels showed no substantial variations from the levels of the previous year.

Pay levels of public employees remain stable during 1950 for the most part, although rising living costs in the last quarter brought demands in some localities for compensating wage increases. Work stoppages by public employees were rare. In Detroit, a threatened strike by municipal transit workers was averted by last-minute action.

One of several amendments to the Social Security act approved by the 1950 session of congress paved the way for state and municipal governments to place their employees under social security coverage if they so desired. While the amendment barred employees who were already under existing retirement systems, several hundred thousand public employees became potentially eligible for coverage. Indications were that several states would take early advantage of the opportunity offered by the revised law.

The calling of public employees into military service caused public jurisdictions to review and bring up to date their policies on leaves of absence for military service. By executive order of the president, permanent civil service appointments in the federal service were suspended after Dec. 1, 1950, and were replaced by indefinite appointments. In California, state civil service regulations were revised to provide for duration appointments as needed. Several public jurisdictions made surveys of employee skills for potential future use in meeting manpower shortages. Jurisdictions where such studies were made included the states of Illinois and Minnesota, Los Angeles county and the city of Detroit. These studies showed that approximately 10% of male employees were subject to draft call, with city fire and police departments being potentially hardest hit.

Charges of Communist leanings among federal employees brought about a formal investigation by a congressional committee. The committee's report, presented after a series of hearings, did not substantiate the charges. In Kansas City, Mo., and Wayne county, Mich., public employees were required to take loyalty oaths; in New York the state supreme court upheld the constitutionality of a law barring members of subversive organizations from employment in the public school system. The New Jersey supreme court ruled that the legislature lacked authority to prescribe a loyalty oath by public office holders and candidates for office. The Hatch act, prohibiting political activity by federal employees, was amended by congress to permit lesser penalties than automatic dismissal for minor violations.

During the year new civil service systems were set up in a number of smaller communities, but no large groups of public employees were involved. In Arizona a proposed constitutional amendment providing civil service for state and municipal employees failed to pass, and in Louisiana the legislature voted down a proposal to re-establish the state's civil service law despite widespread popular demand. (See also MUNICIPAL GOVERNMENT.)

(J. J. DN.)

**Great Britain.**—In Great Britain, the work of rating valuation passed in Feb. 1950 from the local authorities to the inland revenue; and the post office in April took over the functions of Cable and Wireless Ltd. These new responsibilities added about 6,000 workers to the civil service, but the addition was more than offset by reductions elsewhere. The total number of nonindustrial staff employed fell from 694,000 in Oct. 1949 to 675,400 in Oct. 1950.

More posts previously regarded as temporary were established in 1950. Thus 2,000 established posts in the basic executive grade were made available for competition among temporary executive staffs; and the civil service commission also undertook to select 19,000 temporary clerical staffs to be established clerical officers.

October saw the introduction of the scheme of improved salaries for senior civil servants as recommended by the Chorley committee in Sept. 1948. (It would have been introduced in Oct. 1949 but for the devaluation of the pound.)

During the year rules were made under the Superannuation (Miscellaneous Provisions) act, 1948, to facilitate transfers between pensionable employments in the civil service and in local government, teaching or certain of the new public boards, so that a person who had transferred to or from the civil service might reckon his service in his first employment as if it had been rendered in the second.

(E. E. Bs.)

**Clay and Ceramic Products.** The largest single influence in the ceramic industry during 1950 was the continued high level of construction, which provided a record market for building materials and home equipment.

New construction provided new highs in demand for structural clay products, sanitary ware, enamelled kitchenware and structural and window glass. Plants in all these fields operated at capacity and many expanded their production facilities. Severe credit restrictions in the United States were taking effect at the end of the year, reducing the number of new buildings started, and there were indications that the general level of construction would drop off sharply in 1951.

Materials shortages were also being noticed by the end of the year as defense requirements increased, particularly in respect to chemicals for glass, enamels, ceramic colours and special steels for enamelling.

In the pottery and dinnerware fields British production was generally at capacity, with a very good level of exports. Decorated ware was still restricted to the export market. Some British

PROCESSING PLANT opened at Marietta, O., in 1950, for converting raw clay into "Aglite," a lightweight aggregate used to make building blocks. Using widely available raw materials, the new aggregate was expected to require lower production costs than comparable products on the market

plants, turning to highly mechanized mass-production methods, reported increases of as much as 200% in production per man-hour over best prewar levels. The most significant trend in United States dinnerware was the continued adoption of new styles and shapes and modern decoration, replacing many of the old traditional ideas.

Production of several types of heavy clay products set new records, with United States brick being made at rates 7% to 8% above the previous high in 1948.

In England and Europe brick and tile production could not always meet the demand, and severe local shortages developed at times.

The United States flat glass industry broke all records in supplying window glass and glass for the automobile industry. Glass fibre insulating materials manufacturers enlarged their plants to meet the demand, and the growing television industry required millions of picture tubes. On the other hand, producers of hand-made and decorative glass in the United States had difficulty in meeting the prices of imported ware, and this part of the glass industry did not share fully in the general prosperity. (See also GLASS.)

**New Developments.**—An industry-wide research program in structural clay products was started in the United States. Projects in the experimental stage included prestressed tile beams of light weight and high strength.

Larger, more easily assembled units were a chief aim of this program.

Lightweight clay aggregate was being put to new uses in both England and the United States. Used in clay-bonded blocks and tile and in concrete in place of sand and gravel, this material makes lighter-weight products possible, with better insulating and acoustical properties.

New types of glass were announced for screening out the harmful radiations from atomic fission. One of these, a slow-neutron absorbing glass, contained considerable proportions of cadmium borosilicates and fluorides. Replacing such shielding materials as cadmium sheet, this glass offered transparent protection when used in layers only three times as thick as pure cadmium metal shields. Such glasses made possible visual peep-holes in the safety walls in atomic energy plants, and could be used in eyeglasses to protect the vision of workers exposed to radiation.

Numerous advances in television tube manufacture included new types of glass for screens which eliminate reflection and increase picture contrast and high-speed methods of sealing the screen to the rest of the picture tube.

Porcelain enamelled utensils in a variety of colours were in production in many plants, and European manufacturers were displaying coloured enamelled sanitary ware. Architectural applications of porcelain enamel multiplied during the year, with such items as window sills being manufactured of enamelled steel. Commercial porcelain enamelling of aluminum was started for the first time, mainly for interior wall panelling.

Several projects for the development of ceramic refractories for use in atomic energy installations were continued, with progress reported in the use of pure-oxide porcelains and cermets (ceramic-metal combinations) in this field.

In the field of ceramic art, large-scale ceramic sculpture of distinctly modern design dominated the major United States exhibitions, replacing the traditional figurines. Even in the pottery field, the trend was toward massive, utilitarian pieces rather than the delicate, decorative vases. Enamel-on-steel murals were also taking their place as an important art form in the ceramic field.

**Cleveland.** Cleveland, O., had a population of 905,636 by the federal census (preliminary figures) of 1950. Its area is 73.1 sq.mi.

Voters of Cleveland and Cuyahoga county, of which Cleveland is a part, defeated at the Nov. 7, 1950, election a county charter proposal which would have changed the form of county government, placing under it powers to deal with such problems as sewage disposal and health. At the same time Cleveland voters rejected a proposal to eliminate daylight saving time and approved the following bond issues: \$4,000,000 for airports; \$2,500,000 for police and fire buildings; \$2,500,000 for street widening and opening; \$2,000,000 for street grading and paving; \$1,000,000 for municipal parking lots; \$2,000,000 for sewers; \$1,000,000 for City hospital; \$750,000 for lake-front development; and \$750,000 for parks. Joseph F. Gorman and Henry W. Speeth were elected Cuyahoga county commissioners; John J. Carney, county auditor; and Leslie R. Monroe, county treasurer. The county sent to the Ohio general assembly 1 Republican and 5 Democratic state senators and 5 Republican and 12 Democratic representatives.

Industry in the Greater Cleveland area expanded in 1950 at a rate never before equalled in the city's history. Among the plants which were under construction or which went into production in 1950 were: Ford Motor Co., a \$70,000,000 foundry and engine-assembly plant; Chevrolet Motor division of General Motors Corp., a \$39,000,000 plant; Cadillac Motor Car Co., tooling up the World War II Fisher bomber plant for army tank construction, with the initial contract calling for \$110,000,000; Standard Oil of Ohio, a \$4,000,000 catalytic cracker; an \$8,500,000 new structure for the Lincoln Electric Co., Tinnerman Products, Inc. \$2,500,000; and Euclid Road Machinery Co., \$1,120,000. Announced for 1951 were the following expansions: Cleveland Electric Illuminating Co., \$100,000,000; Republic Steel Corp., \$75,000,000; Jones and Laughlin Steel Corp., \$28,000,000; Thompson Products, Inc., \$13,000,000; and Standard Oil of Ohio, \$5,500,000.

Cleveland city council passed a compulsory fair employment practice ordinance, made a 25-yr. contract with the Cleveland Indians baseball team for the use of the municipal stadium, passed the \$22,200,000 Reconstruction Finance corporation bond ordinance for a rapid transit system, and sustained Mayor Thomas A. Burke's veto of legislation to raise councilmen's pay.

The city's budget for 1950 was \$33,900,000, and that of the board of education \$24,805,316. These budgets were the highest in Cleveland's history. (P. By.)

**Climate:** see METEOROLOGY.

**Clothing Industry.** The year 1950 was one of variation in the clothing industry in the United States. Early in the year the trends of previous months were continued; retailers bought cautiously, inventories were held low and factories caught up on their backlogs and cut production. Essentially it was a buyers' market. Military action in Korea, followed by large federal government orders, completely changed the economic picture in midyear.

Following the inception of defense orders, prices on raw and finished materials rose substantially. Increased consumer purchases, partly caused by a fear of future shortages, created a demand for raw materials. The end of the year saw "voluntary" price freezes that were not observed because manufacturers, stocked with high-price materials, were unable and unwilling to hold to sales price levels which had been based on lower-cost materials.

Wage increases in the industry amounted to approximately 8%. Overtime disappeared during the first six months, but began to

HOPALONG CASSIDY CLOTHES in varying price ranges at a New York department store, one of the numerous expressions of interest in the 1950 idol of U.S. children. "Hoppy" (William L. Boyd) entered thousands of homes during the year via radio, TV, comic strips, breakfast foods, etc.

reappear toward the end of the year.

Certain definite factors were observed in the long-range pattern of the industry. The increased use of synthetics continued. Primarily because of price, more rayon and nylon took the place of wool in men's apparel. The world-wide wool shortage accelerated this movement. The demand for cotton goods was greater at the end of the year than it had ever been. New finishes and weaves appeared, and linen and linenlike fabrics enjoyed popularity.

Machinery manufacturers offered newly perfected machines to make better garments faster. Increased industrial effort was reflected in large equipment purchases by apparel manufacturers. Facing manpower and material shortages, garment factories made heavy investments in new machinery. Backlogs appeared at some machinery supply houses, but suppliers were generally meeting the demand. New developments in self-sharpening cloth cutters appeared. A variety of straight and special sewing machines featured high-speed operation; a new, fast, needle feed sewer was about to be marketed as the year closed. Cloth-spreading and power trimming refinements were developed. A new blind-stitch tacking machine was offered in August. Hydraulic pocket slitters, knit-wear seamers and two needle felling machines appeared in new models.

There were no drastic style changes in men's dress. Shirts had the short wide-apart collar tabs of 15 years before. Ties continued along a more conservative trend. The use of colour in men's wear increased little, if any; plaids were featured. Suit coats and topcoats stressed square, wide shoulders, with raised sleeve heads and little suppression at the waist, and sportswear followed the general clothing pattern. Work garments in the United States were becoming more specialized for particular trades. Research was continued toward making military garments more protective.

Women's wear continued the advances previously made. The industry offered well-styled, low-priced cotton and synthetic garments.

The situation in other countries was similar to that in the United States. Western European countries continued to increase production, but began levelling off when war threats became more ominous. Nations under the influence of the Soviet Union suffered from a lack of special machinery, and relied more on hand work. It seemed probable that export orders for United States equipment would not be filled, regardless of destination, because of shortages and increased domestic demand.

The outlook for 1951 was that prices, wages and taxes would be high, the demand for clothing would be strong and the supply would be somewhat limited. Gone was the competitive market of the first half of 1950. Nevertheless, the retail soft-wares market is usually active when hardwares are unobtainable, and hence the industry could foresee an active year. (See also FASHION AND DRESS.)

(S. L. S.)

**Cloves:** see SPICES.

**Coal.** While the 1949 coal outputs of most of the important world coal producers were higher than in 1948, the decline in the United States offset these advances and cut the total by 4%. The outputs of the major producers, as reported by the U.S. bureau of mines, are shown in Table I. This list of 19 countries includes all with outputs in excess of 1,000,000 tons, and their combined outputs account for about 96% of the world total; the four with outputs over 100,000,000 tons (United States, Germany, U.S.S.R. and United Kingdom) account for nearly three-quarters.

**United States.**—The U.S. bureau of mines reported the salient features of the coal industry in the United States as shown in Table II and the output by states as in Table III.

Strikes in the mines cut the 1949 output to the lowest figure

Virginia . . . . .	20.3	19.5	17.2	15.5	20.2	18.0	13.7
West Virginia . . . . .	158.8	164.7	152.0	144.0	176.2	168.9	123.8
Wyoming . . . . .	9.2	9.5	9.8	7.6	8.1	6.4	5.6
Others . . . . .	28.3	28.3	26.2	23.5	24.9	26.9	23.6
Total Bituminous . . . . .	590.2	619.6	577.6	533.9	630.6	599.5	435.0
Anthracite . . . . .	60.6	63.7	54.9	60.5	57.2	57.1	42.7
Grand Total . . . . .	650.8	683.3	632.6	594.4	687.8	656.6	477.7

since 1939, the bituminous total being 31% under the 1947 record high, while anthracite declined 25%. In 1950, production improved, but only moderately. The totals through the week of Dec. 16 were 485,913,000 tons for bituminous and 42,835,000 tons for anthracite. These figures indicate for the year a grand total of about 550,000,000 tons—the lowest since 1940, except for 1949.

**Canada.**—Coal production increased from 18,449,689 tons in 1948 to 19,120,046 tons in 1949, and 17,070,633 tons through Nov. 1950, as compared with 11,536,501 tons in the same period of 1949. Imports dropped from 31,054,148 tons in 1948 to 20,044,619 tons in 1949, but advanced to 16,395,456 tons through Aug. 1950.

(G. A. Ro.)

**Great Britain.**—During its first year of operation in 1947 the National Coal board accounts showed a deficiency of £23,255,965 but during the succeeding years a real improvement took place. The surplus (profit) was £1,651,965 in 1948 and £9,466,813 in 1949. During 1949 £31,000,000 were spent on capital

account and during 1950 the new capital invested was between £30,000,000 and £35,000,000. The production of deep-mined coal in 1949 was 202,500,000 tons and of opencast coal 12,500,000 tons, a total of 215,000,000 tons. For 1950 the totals were: deep-mined coal 204,100,000 tons and opencast 12,200,000 tons, a total of 216,300,000 tons (revised figures).

During the year 30 collieries were closed and the workers transferred to more profitable mines. The coal in some of the abandoned mines was exhausted and in others the remaining reserves could be more readily worked from neighbouring collieries. The general plan of the National Coal board during the succeeding 15 years was to reconstruct some 250 of the 950 mines in production in 1950. A score of new collieries were to be sunk, some 250 of the existing mines would continue without major reconstruction and some 350 to 400 would probably be abandoned.

When the coal mines were nationalized £165,200,000 was allocated for division among 21 coal mining districts as compensation. This was divided among the various districts but the subdivision of the allotted amounts between the companies in each district had not been completed by the end of 1950.

In November the board announced its long awaited "plan for coal." This envisaged the expenditure between 1950 and 1965 of some £635,000,000 of which £115,000,000 would be spent on ancillary plants such as coke ovens. The balance of £520,000,000 was to be spent on new mines and on modernizing existing ones with the hope of producing 240,000,000 tons of coal a year by 80,000 fewer workers than were employed in 1950. Much of this money would be provided by the board's depreciation funds but it was expected that about a quarter would have to be borrowed. The expenditure on new mines and modernization was being phased as follows: 1950, £30,000,000; 1951-55, £190,000,000 (annual average £38,000,000); 1956-60, £160,000,000 (annual average £32,000,000); 1961-65, £140,000,000 (annual average £28,000,000).

Progress in mechanization was maintained. By the end of 1950 75% of coal was being undercut by machines and 75% loaded onto conveyors.

"CRISIS IN THE COAL BIN," a cartoon by Fitzpatrick published in the St. Louis Post-Dispatch in 1950

During 1950 wages remained relatively stable for skilled underground workers. In October, however, the day-wage men and boys received a substantial increase involving an annual increase in the wages bill of some £4,000,000. The average of the earnings of all mine workers, with allowances, was £9 a week.

**Commonwealth.**—Queensland and Victoria, Austr., were developing their resources; so were the Rhodesias. Some engineers thought the future of the Union of South Africa depended on its coal rather than its gold. (J. A. S. R.)

**Coast and Geodetic Survey, U.S.** During 1950 this bureau of the department of commerce continued the survey of the coastal waters, the production of nautical and aeronautical charts for the protection of water-borne and air-borne commerce, and the establishment of the basic geodetic network in the U.S. and Alaska for general mapping and large-scale engineering projects for flood control and reclamation.

Eighteen ships were engaged in hydrographic surveys along the Atlantic, Gulf and Pacific coasts and in Alaska.

In Alaska, surveys, including the collection of original oceanographic data, were extended into unsurveyed areas in the western Aleutian Islands, in Bristol bay and in the Arctic. Two departures from routine ship hydrography characterized the year's work: the initiation of comprehensive tidal current surveys by a major survey ship in the eastern Aleutian Islands passes, and the commencement of original hydrographic surveys of northern Bering sea by two major ships. As the Bering sea area is ice-bound until late in June, these ships operated in the western Aleutians during the preceding months.

Routine tidal observations were continued at stations located along the Atlantic, Gulf, Pacific and South American coasts. Harmonic analysis of these observations furnished information for the prediction of the times and heights of the rise and fall of the sea, and for the establishment of mean sea level.

The national network of geodetic control established for mapping, surveying and engineering construction projects was further extended during the year. Major geodetic activities covered work in the Missouri river basin to provide basic data for surveys and plans for flood control and reclamation, and in various parts of the U.S. and in Alaska to provide triangulation data in advance of the topographic mapping by the geological survey. In western Alaska, geodetic control was accomplished along the northern and southern shores of Bristol bay; across the Alaska peninsula; in the Kuskokwim and Yukon river valleys; and on the peninsula and islands of the northern Bering sea. Measurements of gravity by pendulum and gravity meter and astronomical observations for latitude, longitude and azimuth were made. Three lines of azimuths were measured across an earthquake fault in the western part of the U.S. to provide data for observation of crustal shifts. Observations were continued at two variation-of-latitude observatories.

Closely allied with these major functions of the coast and geodetic survey are measurements of magnetic declination, intensity and dip. Seven magnetic observatories were maintained at widely separated locations from Puerto Rico to Alaska and the Hawaiian Islands for continuous observations of changes in the principal magnetic elements. Observations were made at 87 magnetic field stations during the year. Information was collected and exchanged with scientific institutions engaged in seismology. Strong-motion instruments were maintained for vibration studies in earthquake areas in the western states.

The bureau extended its aerial photographic coverage of coastal areas in the United States and Alaska with the nine-lens camera. It continued the production of 911 nautical charts for the mariner and 914 aeronautical charts for the aviator. These

charts are produced in several series and are maintained, with frequent revisions, to meet the requirements of marine and air navigation. (See also CARTOGRAPHY; GEOGRAPHY; OCEANOGRAPHY.) (L. O. C.)

**Coast Guard, U.S.** Increasing effectiveness of search and rescue team work was indicated by the quick locating and rescue of 12 men stranded on a floating ice floe in Saginaw bay, Michigan, on Feb. 2, 1950. Within an hour after rescue plans had been set in motion the coast guard stations at Tawas City and Bay City, Mich., had dispatched a Dukw and ice skiff; the naval reserve and police had sent vehicles to the shore near by; and two planes of the coast guard auxiliary finally located the men and took them off the ice.

Shortly before midnight on Feb. 13, 1950, 16 crewmen and 1 military passenger bailed out from a disabled B-36 over the west coast of British Columbia. Through the combined efforts of Canadian fishermen and Canadian and U.S. rescue agencies, including the coast guard, 12 were rescued alive.

A Washington state Taylorcraft was reported overdue with its pilot on March 19, 1950, and air search was inaugurated by coast guard, air-rescue service, civil air patrol and civilian agencies. On March 21 a coast guard JRF sighted the crashed plane 20 mi. north of the airway and 15 mi. from the nearest highway. At this time of year the location was almost inaccessible. Air-rescue service dropped a two-man para-rescue team which located the survivor alive, but in bad condition from attempting to wade through deep snow for 24 hr. in ordinary business clothes. A coast guard helicopter landed in soft snow and successfully evacuated the victim, taking off with difficulty. It then evacuated the para-rescue team and a coast guard mechanic dropped on the original trip.

On April 23, 1950, a coast guard PB-1G departed Brooklyn, N.Y., air station for Bermuda, B.W.I., to assist in the search for a missing 26-ft. boat with nine marines and three civilians on board. Identifying the target by flares the British frigate "Big-bury Bay" was conned to the scene and took the survivors on board.

Four barges loading ammunition at South Amboy, N.J., exploded on May 19, 1950. Seven cutters were dispatched with eight public health officers. Auxiliary flotillas reported promptly to assist army, navy and marine contingents. Fire-fighting equipment from nearby lifeboat stations helped bring fires under control in a few hours.

On June 5, 1950, a twin engined C-46 chartered air liner with 65 passengers from San Juan, Puerto Rico, came down in the Atlantic 270 mi. northeast of Miami, Fla. A coast guard PBM from Elizabeth City, N.C., was the first on the scene, dropping life rafts and rescue equipment. With these aids 45 persons were saved.

The hospital ship U.S.S. "Benevolence" with about 526 persons on board sank 4 mi. west of San Francisco Golden Gate on Aug. 25, 1950, after colliding with a freighter. A dozen cutters were first on the scene, rescuing, with army and navy craft, 504 persons.

A navy F8F crashed southwest of Coalinga, Calif., on Sept. 19, 1950. A coast guard JRF and a helicopter were dispatched from Hamilton Air Field base, Calif. The helicopter landed at the scene, a doctor and a medical corpsman having been parachuted 18 min. before, and transported the injured pilot and doctor to Coalinga where they were transferred by a C-47 to Naval Air station, Alameda, and then to Naval hospital, Oak Knoll, Calif.

Rescue work was not confined to the sea but was carried on along flooded rivers of the interior. In April coast guard details were dispatched to Grand Forks, N.D., to save life and property along the flooded Red River of the north. In November

helicopters evacuated 58 isolated persons in California floods and surface craft took care of 56.

Altogether the coast guard rescued 7,619 persons during the year ending June 30, 1950, which was 50% greater than any previous year in its history.

The icebreaker "Mackinaw," with the aid of a helicopter, broke out ore vessels beset in the Great Lakes' ice in April. The first aerial ice reconnaissance flights were made on Feb. 24, 1950, to protect transatlantic shipping from drifting icebergs off the Grand Banks of Newfoundland. A continuous cutter patrol until June 10 was followed by an oceanographic survey and iceberg census in Baffin bay and Davis strait. The icebreaker "Northwind" brought medical assistance to natives in remote arctic areas while on the Bering Sea patrol for the protection of life and property.

Cutters in mid-Atlantic maintained five and two-thirds ocean weather stations and three in the North Pacific. They cruised a total of 668,643 mi., made 19,660 transocean aircraft contacts, sent in 56,456 weather reports and rendered assistance in 63 cases.

The coast guard maintained 37,700 aids to navigation of all types from spar buoys to lighthouses; thirty loran stations located from Greenland around the coasts of the United States to the Philippines gave mariners and airmen quick and accurate determination of their positions in all weather.

Enforcing the oil pollution act, anchorage regulations, revenue, customs, immigration, quarantine and conservation laws, cutter

and aircraft personnel operated on the high seas and on navigable waters as captains of the port.

Conducting 26,750 annual inspections, dry dock examinations, re-inspections and various others, marine inspectors also numbered 452,327 undocumented vessels and investigated 2,239 marine casualties.

Issuing 75,148 documents to officers and men of the merchant marine, there were details in six European ports conducting 6,050 investigations of negligence, incompetence and misconduct of U.S. merchant marine personnel. Shipping commissioners executed 13,699 sets of articles, shipping and discharging seamen.

The coast guard maintained more than 300 cutters, 4,000 small boats and 800 shore units with about 25,000 military personnel. There were 5,400 civilians. Coast guard aircraft flew a total of 31,183 hr. in 11,333 sorties.

The nearly 4,500 members of the reserve at midyear were augmented by 362 officers and 2,722 enlisted men, most of them to be trained in port security work. The nonmilitary auxiliary's 12,000 members, with their affiliated ownership of 6,251 boats, 317 planes and 156 radio stations, conducted 15,000 courtesy motorboat examinations and provided training for 2,400 nonmembers, in the furtherance of maritime safety and efficiency.

After completing the four-year course at the Coast Guard academy at New London, Conn., 68 cadets were commissioned as ensigns and 500 enlisted men were in training each month at Groton Training station, Groton, Conn., to qualify them for higher ratings.

Coast guard security regulations were imposed on Great Lakes vessels transiting the Sault Ste. Marie canal soon after June 25, 1950, and sentries were posted at the locks.

Congress amended the Selective Service act of 1948 in September, permitting the coast guard to use the draft, call up reserves and extend enlistments for a period of 12 mo. (M. O'N.)

**Cobalt:** see MINERAL AND METAL PRODUCTION AND PRICES.

**Cochin-China:** see FRENCH UNION; INDOCHINA.

**Cocoa** (CACA0). World production of cacao beans for 1950-51 was forecast at 1,687,470,000 lb., only a little lower than the record 1,704,140,000 lb. in 1949-50 and considerably more than the 1935-39 average of 1,579,000,000 lb. The African crop, about two-thirds of the total, was estimated at 1,147,110,000 lb., compared with 1,087,390,000 lb. in the previous year. The Gold Coast production was estimated at 625,000,000 lb., compared with 572,000,000 lb. in the previous year, and Nigeria 235,000,000 lb., compared with 228,000,000 lb. in 1949-50. South American production declined to 385,120,000 lb. as compared with 458,880,000 lb. in 1949, largely because of a decline in Brazilian production to 275,000,000 lb. from 355,000,000 lb. the previous year.

The quantity of cacao beans imported into the U.S. during the first 9 months of 1950 was 548,320,705 lb. compared with 642,035,335 lb. in the same months of 1949. The value of imports increased.

During the year prices in the U.S. fluctuated rather widely between 18 and 40 cents per pound, ending the year slightly above 30 cents. Prices to producers were relatively favourable.

(J. K. R.)

**Coffee.** Consumption of coffee in the U.S. in 1950, all from imported supplies, dropped to an estimated 17.0 lb. per capita, compared with 18.6 lb. in the previous year and 14 lb. as a prewar average (1935-39). Imports of raw coffee beans into the U.S. in 1949 were in excess of 22,000,000 bags, but in the first six months of 1950 imports were at a rate only two-thirds as high.

World coffee production for the 1950-51 crop year, according

ELECTRONIC FOG SIGNAL and radio antenna atop the robot lightship placed in operation by the U.S. coast guard off one of the approaches to New York harbour in 1950. One man at a remote control panel at Sandy Hook, N.J., operated its light, radio beacon and fog signal

PILOT PLANT EQUIPMENT for the high vacuum processing of soluble crystal coffee. A full-scale plant for the new food concentrate was set up in 1950 by the National Research corporation of Cambridge, Mass.

to early season forecasts for the main producing countries, was expected to equal 36,766,000 bags, a 2% decline compared with 37,486,000 bags in 1949-50 and an average of 41,600,000 bags for the prewar period. Because of drought and other reasons Brazil was expected to produce only 17,800,000 bags, compared with 19,250,000 bags in the preceding year; their 1951 crop however, was preliminarily forecast as the largest postwar crop, nearly 3,000,000 bags larger than that of 1950. The Colombian crop was estimated at 5,740,000 bags, only slightly less than the preceding year, but about one-third more than prewar. The African crop was 4,671,000 bags, compared with 4,176,000 bags in the previous year. Prospects in Indonesia were favourable for a crop 4% larger than that of the previous year, but only about one-third as large as prewar.

World total exportable supplies dwindled to an estimated 28,445,000 bags, compared with 29,085,000 bags one year earlier and more than 35,000,000 bags prewar. Prices, both retail and wholesale, continued at high levels. A preliminary coffee report, prepared by the staff of a U.S. senate subcommittee investigating price spreads, attracted national and international attention, and the New York coffee and sugar exchange subsequently modified some of its restricted future contracts. (See also BRAZIL.) (J. K. R.)

**Coinage.** The three U.S. coinage mints located at Philadelphia, Pa., San Francisco, Calif., and Denver, Colo., manufactured a total of 591,539,703 domestic and foreign coins during the government fiscal year 1950.

U.S. coin production was valued at \$22,107,499 and consisted of the denominations given in the table.

The composition of the half dollars, quarter dollars and dimes was 90% silver and 10% copper; five-cent coins, 25% nickel and 75% copper; and one-cent coins, 95% copper and 5% zinc and tin in conformity with U.S. coinage laws.

Foreign coinage during the fiscal year 1950 totalled 94,267,944

Denomination	Number of pieces produced
Half dollars . . . . .	16,118,222
Quarter dollars . . . . .	15,938,994
Dimes . . . . .	28,582,573
Five-cent pieces . . . . .	70,976,554
One-cent pieces . . . . .	365,655,416
Total domestic . . . . .	497,271,759

pieces of various denominations and alloys for the governments of China, El Salvador, Ethiopia, Haiti, Honduras, Mexico and Venezuela.

In addition to the coinage mints, four other mint service institutions comprising the bureau of the mint were in operation in 1950—the assay offices at New York city and Seattle, Wash.; the gold-bullion depository at Fort Knox, Ky.; and the silver-bullion depository at West Point, N.Y. The entire mint service is administered by the director of the mint, with offices in Washington, D.C.

The principal functions of the bureau of the mint, other than the manufacture of domestic and foreign coins, include the safeguarding of the government's holdings of monetary metals, valued at billions of dollars; acquisition of gold and silver bullion; the refining of gold and silver; administration of the issuance of treasury licences for the acquisition, ownership, possession, use and exportation of gold for industrial, professional and artistic purposes; the manufacture of medals for the armed services and the manufacture of medals of historic interest for sale to the public.

At the close of the government fiscal year 1950 the mint institutions held in their custody approximately 24,000 tons of gold bullion valued at more than \$24,000,000,000; and approximately 46,000 tons of silver bullion. (N. T. R.)

**Coke.** Though coke outputs in Germany, Belgium and Japan were still low, other countries had increased so much that the world total in 1949 was 17.5% above the prewar level, but still 13% below the 1943 war peak. Table I shows the outputs of the major producing countries, as reported by the U.S. bureau of mines. This list accounts for 95% of the world total.

\*Not including gashouse coke.

**United States.**—Because of strikes in the coal and steel industries, the demand for and supply of coke in 1949 dropped 15%. Table II presents the more important statistics of the industry, as reported by the U.S. bureau of mines.

Table II.—Coke Production in U.S.

(In thousands of short tons)

	1944	1945	1946	1947	1948	1949
Production . . . . .	74,038	67,308	58,498	73,446	74,862	63,637
By-product . . . . .	67,065	62,094	53,929	66,759	68,284	60,222
Beehive . . . . .	6,973	5,214	4,568	6,687	6,578	3,415
Breeze made . . . . .	5,116	4,721	4,308	5,602	5,874	4,989
Coal charged . . . . .	105,296	95,672	83,527	105,062	107,562	91,409
Consumption, total . . . . .	72,971	66,074	57,322	72,611	73,756	63,191
By iron furnaces . . . . .	57,072	50,653	43,098	57,636	59,286	51,515

The 1949 production rate was improved in 1950, the total for the first three quarters being 52,510,701 tons.

**Canada.**—Coke production (including gas retort coke) dropped from 3,945,776 short tons in 1948 to 3,867,066 tons in 1949 and 1,919,462 tons in the first half of 1950 (G. A. Ro.)

**Cold, Common.** The matter of greatest interest in respect to the common cold during 1950 was the final disposition of the problem of its treatment and prevention with antihistaminic agents. Although an estimated \$100,000,000 was spent on these drugs during the year, successive reports of a number of investigators who tested the effects of antihistaminic agents in controlled studies found them to be valueless for either the prevention or treatment of colds. Allergic rhinitis, which mimics the common cold, may be alleviated with antihistaminic drugs.

Similarly, it had not been established that there was value in treating colds with penicillin, aureomycin, chloramphenicol or terramycin. In fact, it was believed that harm might be done by their use. The suppression of growth of some bacteria appears to permit other pathogenic bacteria and fungi to grow and cause disease. Furthermore, the oral administration of antibiotics is apt to sensitize persons to them so that untoward reaction may occur if antibiotic agents actually are needed and given later.

Among investigators of the common cold, W. J. Kerr still did not believe the disease to be a contagious one caused by a virus or spread by human contact. Physiologic mechanisms disturbed by cooling or other irritating factors presumably were blamed for the symptoms. However, according to C. H. Andrewes, who was conducting extensive research on the subject, a virus causes the common cold, and A. L. Bloomfield held that no serious student of the common cold problem doubted that the essential cause is a filtrable virus.

Several investigators had previously reported success in the cultivation or propagation of the virus of colds in artificial media, but Andrewes was not able to confirm the results, nor had he succeeded in transmitting the disease to a variety of small animals. T. G. Ward's laboratory reported that a virus isolated from a patient with a cold was propagated in five transfers in the chick embryo. In several controlled studies, colds developed in 61% of 23 volunteers in whom such cultures were instilled into the nose. No colds developed in 24 other volunteers to whom material not containing the virus was given.

**Collins, J(oseph) Lawton** (1896— ), U.S. general, was born on May 1 in New Orleans, La. He was graduated from the U.S. Military academy at West Point, N.Y., in 1917. He served in the army of occupation in Germany after World War I, taught at West Point for four years, then attended various U.S. army schools. From Dec. 17, 1941, to May 8, 1942, he was chief of staff of the Hawaiian department. In Dec. 1942 he led the 25th infantry division into Guadalcanal. In Feb. 1944 he took over command of the U.S. 7th corps in England, and it was under his command that the corps led the break-through at St. Lô, France, after the European invasion. He led this corps through France and Germany to a junction with the Russians on the Elbe. He was made a permanent major general on Jan. 24, 1948, with the temporary rank of full general.

From Aug. to Dec. 1945, General Collins was deputy commanding general and chief of staff of the army ground forces in Washington, D.C. He was for two years war department director of information, in 1947 becoming deputy chief of staff, the following year vice-chief of staff and in Aug. 1949 chief of staff of the U.S. army. In July 1950 and again in August he went to Tokyo, Japan, for top-echelon discussions on the progress of the war in Korea. On the second trip he toured the Korean front.

**Colombia.** A republic situated in northwestern South America adjoining the isthmus of Panamá, Colombia is the only South American country with both Caribbean and Pacific coast lines. Area: 439,714 sq.mi.; pop. (1949 official est.): 11,015,000. Approximately 68% of the population is classified as mixed blood, 20% as white, 7% as Indian and 5% as Negro. Most of the inhabitants live in the highlands and mountain valleys of the interior. The capital is Bogotá (pop. in 1947: 482,480). Other principal cities are Barranquilla (225,430), Bucaramanga (71,240), Cali (147,160), Cartagena (106,820), Cúcuta (77,480), Ibagué (84,840), Manizales (117,760), Medellín (237,220), Neiva (39,490), Pasto (63,430), Popayán (35,960), Santa Marta (43,950) and Tunja (27,080). Language: Spanish, religion, predominantly Roman Catholic. Presidents in 1950: Mariano Ospina Pérez and, from Aug. 7 Laureano Gómez.

**History.**—The year 1950 marked a complete break from the traditional practices of minority representation in the national government and adherence to constitutional principles. A state of siege continued in force throughout the year; the congress remained prorogued; the supreme court remained ineffectual in judicial review; and control over presidential succession was changed from a congressional to an executive function. The Liberal party, which had virtually boycotted the presidential election in Nov. 1949, refused to recognize the legality of the Conservative administration of Laureano Gómez and resorted to protest strikes in the capital and guerrilla warfare in the provinces.

In May the announcement by Pres. Mariano Ospina Pérez that the congress (scheduled to convene in July) would not meet during the year virtually eliminated Liberal party participation in the government. Liberal influence was further impaired by rigorous press censorship and by a renewed clerical campaign against secular education.

Spotty reports in the controlled press indicated that most of the guerrilla resistance was in the departments of Santander, Antioquia, Bolívar and Tolima. Casualties numbered in the hundreds, and there was widespread emigration of noncombatants from one department to another to escape persecution.

Gómez succeeded Ospina Pérez as president on Aug. 7 and selected his cabinet exclusively from the Conservative party. The question of presidential succession arose when the new chief executive suffered a serious but temporary illness. Congress had previously designated former Pres. Eduardo Santos, a Liberal, but in September Gómez decreed that Santos' eligibility had expired with the inauguration of the new administration; that, in case of death or disability, the president would be succeeded by the members of his cabinet, in the order of their seniority. The Liberals protested this ruling as a flagrant violation of the constitution, and a strike was declared by the university students on Sept. 27.

In August a national convention of Liberals pronounced the Gómez administration illegal and adopted a policy of noncollaboration. A manifesto written by Darío Echandía asserted that the party would abstain from the state and municipal elections of 1951, because it was being denied freedom of speech, press, assembly and movement; that constitutional guarantees had been suspended in 1949 solely to prevent a Liberal victory at the polls.

On the economic front, the government appointed a committee

to study the report of the International Bank for Reconstruction and Development commission's survey of Colombia's economy. The bank's report suggested a five-year, \$2,500,000,000 over-all development program to promote and integrate the industrial and agricultural resources of the country. Pending completion of negotiations for the World bank loan, the government and private industry went ahead with their program of borrowing to develop hydroelectric power, irrigation, highways, railroads, pipe lines and the petroleum, steel and rayon industries.

In foreign affairs, Colombia approved the United Nations' decision to intervene in Korea, and offered the use of a 1,430-ton frigate plus unspecified general economic assistance. The dispute with Peru over Colombia's right to grant asylum to the outlawed political leader Víctor Raúl Haya de la Torre (sheltered by the Colombian embassy at Lima since Jan. 3, 1949) was given a ruling, Nov. 20, by the International Court of Justice. The decision, however, left undecided the question of whether Colombia was required to surrender the fugitive to the Peruvian government, and tension between the two countries continued.

A disastrous earthquake, occurring July 9-11 in the department of Santander, killed an estimated 150 persons, left about 40,000 homeless and caused several million dollars worth of damage. Some small towns were totally destroyed.

**Education.**—In 1947, 11,320 primary schools reported enrolments totaling 738,716 pupils with 17,528 teachers; 1,005 secondary and vocational schools listed 92,112 students and 7,480 teachers; 57 colleges and universities reported 8,032 students and 1,335 professors. In addition, 1,206 primary, 630 secondary and 2 higher educational institutions did not report enrolments. In 1949, 19,854,944.07 pesos (5.5% of the national budget) was allocated to public education.

**Finance.**—The monetary unit is the peso, valued officially at 51.02 cents U.S. and on Oct. 31, 1950, at 29.59 cents on the free market. The national budget for 1950 called for receipts and expenditures balancing at 422,431,000 pesos. For the first six months of the year, revenues reached 201,365,000 pesos; appropriations, 192,505,000 pesos; accumulated deficit, 27,000,000 pesos; total currency in circulation, 1,001,873 pesos. On June 30, 1950, the internal debt was 361,571,017 pesos; the foreign debt, 147,285,089.66 pesos. As of Aug. 31, 1950, the total assets of the Bank of the Republic amounted to 755,075,450.82 pesos; major liabilities, 439,539,816.50 pesos in circulating bank notes and 157,971,800.21 pesos in deposits; gold and foreign-exchange holdings, 225,656,293.30 pesos.

**Trade and Resources.**—In 1949 exports were valued at \$337,000,000 excluding monetary gold and silver (\$291,600,000 in 1948 including same); imports, \$282,000,000 (\$335,000,000 in 1948), excluding monetary gold and silver. The United States took 81% of the exports and supplied 69% of the imports. Coffee (5,410,000 bags of 132 lb.) accounted for 74% of the export value in 1949; petroleum (about 22,800,000 bbl. of 42 gal.) 18%; bananas (about 6,000,000 stems) 3%; gold (403,590 troy ounces) 3%; and platinum (18,961 troy ounces) 0.5%. Approximately 86% of the imports were manufactured and semifinished goods.

**Transportation and Communication.**—During the first ten months of 1949, ten railroad lines totalling 2,159 mi. carried 11,289,883 passengers and 2,128,866 tons of cargo (10,935,186 passengers and 2,529,800 tons in the same period of 1948). At the end of 1948 there were 11,166 mi. of improved highways, 25,657 automobiles and 22,830 trucks and buses. There were 4,620 mi. of navigable rivers and 72.5 mi. of aerial cables. In 1949 the two major and eight minor domestic air lines flew 14,828,256 mi., carrying 797,184 passengers and 157,958 tons of cargo (13,446,192 mi., 703,929 passengers and 120,844 tons in 1948). In 1947 there were 29,095 mi. of telegraph and 118,676 mi. of telephone lines, 62,414 telephones and about 200,000 radios.

**Agriculture.**—The basic industry in Colombia is agriculture, and coffee (approximately 6,140,000 bags of 132 lb. in 1949) is the main commercial crop. Other crops (with 1949 production figures) are: corn 709,500 tons; potatoes 528,000 tons; sugar 152,295 tons; rice 143,000 tons; wheat 132,000 tons; barley 33,000 tons; cotton 7,134 tons; and bananas approx. 6,000,000 stems.

**Manufacturing.**—In 1949 manufactured goods were valued at 2,008,000,000 pesos, representing a 25% increase over the value of production in 1948. Processed foodstuffs accounted for 720,000,000 pesos; textiles 331,000,000 pesos; beverages 288,000,000 pesos; clothing 121,000,000 pesos; leather goods 88,000,000 pesos; minerals 74,000,000 pesos; chemicals 74,000,000 pesos; and tobacco 66,000,000 pesos.

**Mineral Production.**—The chief extractive industries (with 1949 production figures) are: petroleum 29,722,406 standard bbl.; gold 359,475 troy ounces; silver 106,678 ounces; platinum 19,739 ounces; salt 125,920 tons; and cement 474,726 tons. Petroleum production during the first half of 1950 was 15,874,000 bbl. (14,803,000 in the first half of 1949).

(M. L. M.)

**Colorado.** A Rocky mountain state of the United States in the west-central part, Colorado has a mean elevation above sea level of 6,800 ft., the highest of any state. Admitted to the union in 1876 as the 38th state, it is known as the "Centennial state." Its area of 104,247 sq.mi. includes 280 sq.mi. of water surface. The U.S. owns 34.5% of the total land area and 59.3% is in private ownership, the remainder belonging to state, county and municipal governments.

Population (1940) 1,123,296; 52.6% urban, 47.4% rural; 93.6% native, 6.4% foreign-born; white 98.5%, Negro 1.1%, other .4%; 102.6 males per 100 females. The 1940 census reported 2,734 Japanese, the largest in number of all races other than white and Negro. The 1950 census as of April 1 showed a population of 1,325,089, a gain of 18% from 1940. Capital, Denver, pop., preliminary 1950 census, 412,856. Other cities (with preliminary 1950 populations): Pueblo 63,561; Colorado Springs, 45,268; Greeley, 20,286.

**History.**—An extraordinary session of the Colorado state legislature was called by Gov. Walter W. Johnson in Aug. 1950, at which time an income tax reduction bill for a flat 20% reduction in all 1950 individual and corporation state income taxes was passed. Three other major bills enacted into law were:

A bill to provide for civilian defense in cases of war emergencies.

A bill to permit all members of the Jewish faith to vote by absentee ballot in the Sept. 12 Colorado primary election. The primary date coincided with the Jewish New Year holiday of Rosh Hoshana.

An appropriation of \$275,000 to rebuild at Colorado Springs the State Deaf and Blind school's main building, which had been destroyed by fire.

Democrats occupied all but one of the major state offices during 1949 and 1950. Gov. Walter W. Johnson, former lieutenant governor, began his term as governor when William Lee Knous was appointed a federal district judge in April 1950. Other principal officers were: George J. Baker, secretary of state; Myron G. McGinley, state auditor; John W. Metzger, attorney general; Homer F. Bedford, state treasurer; Mrs. Nettie S. Freed, the only Republican, commissioner of education.

Three constitutional amendments were voted on at the Nov. 7, 1950, off-year election: The first was to provide a more flexible method of amending the charters of home-rule cities. This was passed by a big majority. Another was the requirement for the legislature to meet each January (not just in January of odd-numbered years), and to change procedures in the legislature and state government. This was also passed. The third was a proposal to remove department heads from civil service. This amendment was defeated.

Republicans swept to full command of the Colorado state legislature. The turnover meant a major shift in party bloc leadership when the 38th general assembly would convene in Jan. 1951.

Eugene D. Millikin (Rep.) was re-elected to the U.S. senate. Other state officers elected were Daniel I. J. Thornton (Rep.), governor; Gordon Allott (Rep.), lieutenant governor; George J. Baker (Dem.), re-elected secretary of state; Homer F. Bedford (Dem.), auditor; Earl E. Ewing (Rep.), treasurer; Duke W. Dunbar (Rep.), attorney general.

DAN THORNTON, Republican, elected governor of Colorado, Nov. 7, 1950

**Education.**—The state appropriation for education in the public schools for 1949-50 was \$8,861,007. The average current expense per pupil in average daily attendance for the school year 1948-49 was \$204.19; the total average daily attendance was 193,362. The total average daily attendance increased to 194,497 during 1949-50. The school population, including persons 6 through 21 years of age, increased from 305,068 in 1949 to 314,399 in 1950. A total of 10,067 teachers and administrators were employed in the Colorado public schools.

During the year 1949, Colorado's 130 public libraries spent \$922,671.74 to improve and expand their services.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Disbursements from the state public welfare fund for assistance and administration in 1949 amounted to \$52,012,647.55. Of this amount, \$40,252,100.37 was expended for pensions, including burials; \$4,867,830.48 for aid to dependent children; \$289,300.69 for aid to the blind, for awards, treatment and burials; \$3,970,478.88 for general assistance; \$369,997.02 for tuberculosis hospitalization including outpatient care and burials; \$224,356.09 for child welfare; and \$2,038,584.02 for state office administration expenses and allotments to counties for the state's share of salaries and travel. In addition to the above, there was a transfer to the general fund of \$1,678,899.00. Federal participation during 1949 in old-age pensions, aid to dependent children, aid to the blind, child welfare and administration amounted to \$18,929,690.07.

The average monthly number of recipients by program was as follows: for old-age pension, 47,718 received an average of \$70.25; 13,940 child recipients of aid to dependent children received an average of \$29.18 per child; and 387 aid to the blind cases received an average of \$55.75.

**Communications.**—Total highways (state and federal aid and county) totalled 78,789 mi. Improved roads totalled 23,337 mi.; unimproved 55,432 mi. The state highway system measured 12,415 mi. Total funds disbursed for highways in 1949 amounted to \$25,963,109.75. Registered motor vehicles in 1949 numbered 532,440. In 1950 there were 54 bus companies serving the state, and 19 railroads had a total railroad mileage within the state of 4,301 mi. There were five scheduled air lines serving the state. There were 170 airports and landing fields operating, of which approximately 55 were personal-use ranch-type fields.

Telephones in use on Dec. 31, 1949, numbered 404,500. There were 33 standard AM radio stations and 3 FM stations.

**Banking and Finance.**—As of Dec. 1949 there were 77 national banks and 67 state banks. Deposits in all banks at the close of 1949 were \$1,042,000,000. Clearings in Denver (1949) \$5,175,420,859.90; in Pueblo \$107,823,196; in Colorado Springs \$121,219,312.

The cash balance in the treasury on June 30, 1950 was \$46,297,985.21. Total revenue in the fiscal year ended June 30, 1950, was \$156,747,612.40. All expenditures, including functional services, debt services and transfers amounted to \$155,229,320.87. Debts—bonded, \$436,900 and anticipation warrants \$7,290,000; outstanding warrants, cash and general revenue \$6,293,671.84. Investments of \$32,309,958.76 plus a cash balance on June 30, 1950, of \$46,297,985.21 made a total of \$78,607,943.97 in liquid assets. The state surplus at the close of its fiscal year on June 30, 1950, was \$19,135,000.

**Agriculture.**—In 1949 the value of agricultural products marketed was \$245,286,000. Livestock and livestock products brought \$280,847,000, for a combined total of \$526,133,000. Production of the leading crops during 1950 is given in Table I.

**Manufacturing and Industry.**—The department of commerce estimate for the value added by manufacture in Colorado in 1947 (latest manufacturing census) was \$290,300,000, an increase of 221% over 1939. In 1950 there were 1,602 industries in the state, employing 54,300 persons, with an annual pay roll of \$145,000,000. The principal industries were food and kindred products, machinery (except electrical), printing and publishing, petroleum and coal products and stone, clay and glass products. Colorado is primarily a state of small industries, only 7 plants out of each 100 employing more than 50 persons.

Table I.—Leading Agricultural Products of Colorado

Crop	1950	1949	Average 1939-48
Corn, bu. . . . .	14,496,000	17,314,000	14,122,000
Wheat, all, bu. . . . .	39,924,000	49,551,000	32,247,000
Oats, bu. . . . .	4,940,000	7,470,000	5,798,000
Barley, bu. . . . .	9,555,000	23,256,000	15,182,000
Sugar beets, tons. . . . .	2,190,000	1,878,000	1,849,000
Potatoes, bu. . . . .	18,600,000	18,810,000	16,618,000
Dry beans, 100-lb. bags. . . . .	1,816,000	2,537,000	1,944,000
Broomcorn, tons. . . . .	6,500	11,600	11,460
Hay crops, tons. . . . .	1,984,000	2,360,000	2,177,000
Apples, commercial, bu. . . . .	903,000	1,628,000	1,469,000
Peaches, bu. . . . .	1,219,000	2,109,000	1,901,000
Pears, bu. . . . .	142,000	204,000	184,000

Table II.—Leading Mineral Products of Colorado

Mineral	Production 1949	Value 1949
Molybdenum . . . . .	2,025,440 lb.	\$ 1,822,896
Zinc . . . . .	47,703 short tons	11,830,344
Gold . . . . .	102,618 fine oz.	3,591,630
Lead . . . . .	26,853 short tons	8,485,548
Silver . . . . .	2,894,886 fine oz.	2,620,018
Copper . . . . .	2,408 short tons	946,782

Tourist travel in Colorado is the third largest industry in the state. In 1949 the income derived from 2,626,000 travellers was \$211,780,000.

**Mineral Production.**—Colorado ranks first among the states in the production of vanadium, third in zinc, fourth in lead and high in molybdenum. The total number of persons employed in the state's mineral industries in 1949 was 7,679. The total coal produced was 4,579,589 tons, valued at \$22,699,426. The number of men employed in the coal mines was 5,289.

A contract to renew work upon Leadville's drainage tunnel was awarded in 1950. Completion of the tunnel would restore the opportunity to enter mines long flooded by subterranean water.

‡1948 census.

§1948 est.

**Communism.** Throughout 1950 communism in its world-wide ramifications followed and accentuated the trends which had developed since 1945. The victory of communism in China and the dynamic imperialism which the "new" China quickly made its aim for the whole of Asia increased Communist confidence in its final total triumph. Communists insistently proclaimed their dogmatic faith that "socialism" is infinitely superior to and immeasurably more just than "capitalism." By "capitalism" they understood every form of government and of political and social organization which did not accept the unquestioned authority of Joseph Stalin—whether it was the communism of Tito's Yugoslavia, or the democratic socialism of the British and Norwegian labour parties, or the New Deal in the United States, or the traditional free enterprise system. According to the Communists, the Soviet Union was the model "socialist" state, and whatever it did was thereby "socialist," morally good and politically wise. Therefore the Soviet Union and its satellites had the right to interpret pacts and agreements. Should any country oppose their "socialist" and "just" demands, the Communists for the sake of socialism and justice would be forced to realize their demands by any means possible. For their "socialist" and "just" demands aimed at a true "peace" as understood by Communist theory in which all the "capitalist" forces hostile to "peace" would be destroyed or at least rendered innocuous. Should a conflict ensue, according to the Communist theory it would not be the Communist aggressor which would be guilty but the attacked party which had "wickedly" resisted the demands

of justice and the course of history.

This trend of mind made fruitful conversations between communism and the non-Communist world difficult and increased a tension which in 1950 assumed a world-wide and acute character. It made itself felt with equal intensity in the western world and in Asia. Dissensions and crises in the Communist countries were veiled by the "iron curtain" but doubtless in spite of terror-enforced conformism there existed serious tensions even within the Soviet Union. The death penalty which had been abolished in the Soviet Union on May 26, 1947, was reintroduced by a decree of Jan. 12, 1950, for "traitors to the fatherland, spies and saboteurs." This was a very wide and all-inclusive classification, for in Communist countries any casual information on economic facts which nowhere else would be regarded as secret represented a most serious crime. In spite of the widely advertised "enthusiasm of the whole soviet population for its democratic regime" no other country harboured apparently as many "traitors" and "saboteurs" as the Communist countries did.

These "saboteurs" seemed numerous even among the highest Communist officials. Men who had been glorified for years as models of "socialism" and public virtue were revealed time and again as criminal characters who committed their "crimes" at the very time when they were acknowledged communist leaders.

Resistance in the Soviet Union seemed centred chiefly in the national minorities, of which the most important were the Ukrainians who inhabit the southwestern part of the Soviet Union, and the Mohammedans in central Asia. Part of the resistance

may also be explained by the almost unbearable burden which the economic demands of the five-year plans imposed upon the workers and farmers.

One of the symptoms of a general tension was the need for Premier Stalin to "reinterpret" Marxist theory. In the Moscow newspaper *Pravda* of June 20, 1950, he demolished the school of philology founded by Nikolai Yakovlevich Marr (1864-1934). Yet this school had taught for 25 years the only officially recognized and "truly Communist" theory of language. Marr, once praised by Stalin as "the only genuine Marxist philologist" was now condemned as completely false and his school's (typically Communist) persecution of any criticism or dissent was branded as reactionary. Marr had taught that languages were superstructures of class divisions and that the language of the "most progressive proletarian culture," Russian, would become the international world language. Now Stalin rejected both these positions.

Stalin's article, published on Aug. 1 in the party monthly *Bolshevik* in a reply to "Comrade A. Kholopov," tried to explain to those Marxists who believed that after the successful revolution the state would "wither away," why this did not happen and why on the contrary the "socialist" state had grown more and more oppressive. He assailed the Marxists as doctrinaire "exegetes" and "Talmudists." Marxism after its victory in one state must lead, according to Stalin and contrary to former Marxist theory, to a strengthening of the state, its machinery and its armed forces. Only after the world-wide victory of the Communist revolution could the state terror system relax and ultimately vanish. In his polemic against Marxist "Talmudists," Stalin arrived at the rather unexpected conclusion that "Marxism is the enemy of all dogmatism," thereby theoretically opening the way to a reinterpretation of Marxism according to Stalin's needs in the world crisis produced by Communist aspirations.

The number of Communists who were convinced of this right and duty to lead and transform the world according to their doctrine represented only a small minority of mankind. The number of members of the Communist parties throughout the world was estimated in 1950 at 26,000,000. Of this number 7,000,000 lived in the Soviet Union; the Chinese party, the second largest in the world, claimed 4,000,000 members, twice the figure mentioned for 1947. The strongest parties in Europe were in Italy (2,532,000), Czechoslovakia (2,300,000), Poland (1,360,000) and Rumania (1,000,000). Several European parties acknowledged great losses in numbers, among them the French whose membership declined from 1,300,000 in 1947 to 800,000 in 1950. Some Communist parties were organized in the Communist Information bureau or Cominform. The Cominform included, however, only the Russian satellites in Europe, besides the French and Italian parties, and served in 1950 primarily in connection with Stalin's struggle against Tito's Yugoslavia and Stalin's design to control the whole of Germany.

The Communist International or Comintern which was dissolved in 1943 had not been revived, probably because its absence gave to the Kremlin a greater liberty for undisputed Russian leadership over the whole Communist movement.

However, Communist national party congresses served as meeting grounds for the international Communist leadership. Thus in May 1949 Communist leaders from 55 countries assembled in Prague, Czechoslovakia, while in July 1950 Communist leaders from Europe and Asia met in Berlin as guests of the third annual convention of the German Socialist Unity party, the official name of the Communists in the soviet-occupied portion of Germany. In their outward manifestations these meetings emphasized "the anti-imperialistic peace front" against Anglo-American "war mongers." Yugoslavia, though ruled by Communists, was one of the chief targets of Stalinist attacks. As a result Marshal Tito's government was forced into an ever more definite

opposition to the Soviet Union and its satellites.

Outside the officially Communist-controlled countries, the movement continued in 1950 to lose heavily in influence throughout the western world. Even in the soviet-occupied parts of Austria and Germany the Communist leaders complained of serious setbacks. In western Germany the disintegration of the Communist party progressed far and rapidly.

Every election held in western Europe during 1950 bore witness to the decline of the Communist party in numbers and influence. In the United States the Communist party reached its lowest mark in 1950.

While thus communism was successfully contained in Europe and the western world, its weakness there was balanced by its spread in Asia, where its aggressive expansionism led to the war in Korea and offered an open challenge to the authority of the United Nations. The Chinese Communists vied with the Kremlin in attacks against the United States. On the eve of the anniversary of the establishment of the Chinese People's Republic, Chou En-lai, its premier and foreign minister, denounced the United States as "the most dangerous enemy" of the "Chinese people." Following in the wake of the other nations accepting Moscow's leadership, the Chinese ministry of cultural affairs began to remould China's cultural traditions in the Marxist-Stalinist sense and to swamp the country with translations from soviet Russian literature. An all-encompassing program for the basic indoctrination of Chinese youth was drawn up. Chinese influence strengthened also the Communist movements in Thailand, Malaya and the Philippines where there were large Chinese settlements. In the Philippine Islands the Hukbalahap, an armed Communist uprising, threatened the order in central Luzon. In French Indochina the Communist forces gathered military strength. On the other hand the influence of communism had diminished, at least temporarily, in Japan and India. This was partly the result of government measures and partly because of internal dissensions and rivalries within the Communist parties. Communist efforts to capture Asiatic labour were organized at the Asian Trade Union conference, called in Peking, China, in April under the lead of the Communist-dominated World Federation of Trade Unions. Delegates from Burma, Ceylon, China,

SENATORS Henry C. Lodge, Jr. (left), Bourke B. Hickenlooper and Millard E. Tydings reading a document presented during 1950 hearings on the charge that Owen J. Lattimore was a soviet agent. Lattimore was cleared of the charge in July, after a four-month subcommittee investigation

India, Indonesia, Iran, Korea, Malaya, Mongolia, Philippines, Thailand, Viêt-Nam and Australia attended.

The non-Communist world countered the Communist threat in three principal ways: military preparedness and unification; plans to alleviate the economic misery especially in the "backward" countries; and legislative measures for a stricter control of domestic Communist activities. The South African parliament passed an anti-Communist bill on June 20. An Australian law ordering dissolution of the Communist party became effective Oct. 19, but enforcement was barred by a high court order Nov. 2 pending a ruling on its constitutionality. In Latin America, Bolivia and Venezuela joined Brazil, Chile and Peru in outlawing the Communist party. The centre of Communist agitation in Central America was located in Guatemala. The Confederation of Latin American Workers, under the chairmanship of the Mexican labour leader Vicente Lombardo Toledano, resumed its Communist-controlled activities directed against "Yankee imperialism" but was weakened in its effects by the activities of the Inter-American Confederation of Labor which co-operated with the American Federation of Labor. In the United States the International Security act of Sept. 1950 provided for the registering of Communists and their internment in times of emergency.

**Community Chest.** The community chest is the name given to a local federation made up of health, welfare and recreation agencies supported by voluntary contributions. Its purpose is to raise annually, by a single united campaign, funds for the support of its member agencies, and, through community welfare councils financed by chest funds, to promote joint planning for health and welfare in the community.

Community Chests and Councils of America, Inc., the national association of local community chests and welfare councils, was organized in Feb. 1918.

Of the 1,799 community chests and welfare councils in operation in Aug. 1950 (1,389 chests and 410 councils), 1,324 chests and 406 councils were in the continental U.S.; 5 chests and 4 councils in Hawaii; 51 chests and 22 councils in Canada; 2 chests in South Africa; 1 chest in the Virgin Islands; 1 chest in Puerto Rico; 1 council in the British West Indies; 3 chests in Japan; 1 chest in the Philippines and 1 chest in Alaska. Almost every city in the U.S. (except New York city, which has a limited joint-financing organization and a welfare council) in 1950 had a community chest or similar plan of federated financing for its voluntary social services. In 1,318 cities in 1949, more than 18,000,000 contributions totalling \$192,933,988 were given to community chests to be used during 1950 for voluntary health and welfare services in their communities. In 1950, following the dissolution of the United Service organizations (U.S.O.), the Associated Services for the Armed Forces, Inc., was established and received its major support through chests.

National promotion of chest campaigns is carried on under the name "The Community Chests of America," using the national symbol of the red feather.

Officers of C.C.C., Inc., for 1950 were: honorary president, Gerard Swope, New York city; president, Stanley C. Allyn, Dayton, O.; treasurer, H. L. R. Emmet, Erie, Pa.; secretary, Mrs. Oswald B. Lord, New York city. Ralph H. Blanchard was executive director.

FILMS OF 1950.—*E Pluribus Unum* (Magazine Service, Community Chests and Councils of America, Inc.). (B. A.)

**Community Trusts.** Aggregate assets of \$100,135,527 were reported by community trusts and foundations in the United States, Canada and Hawaii at Jan. 1, 1950. During 1949 these composite foundations appropriated \$3,855,283 for charitable projects and received new resources totalling \$5,638,335.

The largest of these foundations was the New York Community trust, whose 100 funds were valued at \$19,258,489. The Chicago Community trust held \$14,533,977; the Cleveland foundation, \$11,294,011; the Permanent Charity fund, Boston, \$8,703,925; and the California Community foundation, Los Angeles, \$7,488,261.

Of the disbursements made in 1949, the New York Community trust paid out \$1,065,065; Chicago, \$416,680; Cleveland, \$412,297; and Boston, \$407,846.

Funds newly received during that year included \$1,204,500 accruing to the Indianapolis foundation; \$1,130,195 reaching the California Community foundation; and \$639,316 added to the New York Community trust. Newly established units in Cedar Rapids, Ia., Hamilton, O., Lansing, Mich., and Vancouver, B.C., became operative during 1949.

Of 76 community trusts surveyed in the forefront of 1950, 66 were holding principal resources and 58 were making current distributions out of 829 funds on hand. The cumulative disbursements of community foundations since 1930 were \$34,468,635.

A community trust consists, ordinarily, of a number of trust funds of varied sizes and for diverse charitable uses. Fiscal management of the administered units is usually lodged in trustee banks selected by the contributors of the funds. Appropriations are made by the authority and under the supervision of a central distributing committee, which undertakes to give expression to the specific desires of a founder and which is likewise empowered by him to take appropriate remedial action if originally expressed preferences subsequently became impossible or impractical of execution.

**Congo, Belgian:** see BELGIAN COLONIAL EMPIRE.

**Congregational Christian Churches.** The Congregational Christian Churches are religious groups of Christian disciples organized on a democratic basis. The local churches are united in district associations, state conferences and the National General council for fellowship, planning and mutual help.

The Congregational principle of church organization has been implicit in Christianity from the beginning but became active in the 16th century in England. The Congregationalists went to America (Plymouth, Mass.) in 1620 and in the following 150 years spread over New England and southward until at the time of the Revolution these churches numbered approximately 800 out of a total of 1,700 colonial churches.

As of Jan. 1, 1950, the total number of Congregational Christian Churches in the United States was 5,679 with 1,204,789 members, 5,744 ministers and 567,800 church school members. These churches contributed \$5,423,929 to benevolences and \$28,491,418 to local church support during 1949.

For some years the Congregational Christian Churches had been planning a merger with the Evangelical and Reformed Church. During 1949, however, an antimerger faction in the Congregational churches secured a court injunction against further moves toward merger, and at the close of 1950 the matter rested with the appellate court for review. (See also CHRISTIAN UNITY; CHURCH MEMBERSHIP.)

**Congress, United States.** The 82nd U.S. congress convened for its first session on Jan. 3, 1951. It comprised the following members (as of Jan. 3, 1951):

#### United States Senate

Presiding Officer: Alben W. Barkley of Kentucky

Majority Leader: Ernest W. McFarland of Arizona

Minority Leader: Kenneth S. Wherry of Nebraska

Democrats: 48; Republicans: 47; Democratic-Liberal: 1.

**Congress of Industrial Organizations:** see LABOUR UNIONS.

**Connally, Tom (Thomas Terry)** (1877– ), U.S. senator, was born on Aug. 19 in McLennan county, Tex., and studied at Baylor university, Waco, Tex., and the University of Texas, Austin. He served in the Texas house of representatives for two terms beginning in 1900, and went to the U.S. house of representatives for six successive terms beginning in 1916. He was elected to the U.S. senate in 1928 and re-elected in 1934, 1940 and 1946. During most of World War II and the postwar years he served as chairman of the senate foreign relations committee, with the exception of the 80th congress when Republicans controlled that body. He, with Republican Sen. Arthur H. Vandenberg, exemplified the postwar bipartisan foreign policy. Early in 1950 Connally was one of the staunchest supporters of the U.S. Asiatic policy, including the announced decision not to give aid to Chinese nationalist forces in Formosa. In August, when Republicans on the for-

eign relations committee made an issue of foreign policy for the forthcoming congressional elections, Connally accused the Republicans of "plain and palpable" politics, asserting they had participated in the actions whose results they criticized.

**Connecticut.** One of the 13 original states and the southwesternmost of the New England states, popularly known as the "Nutmeg state," the "Land of Steady Habits" or the "Constitution state." Connecticut has an area of 5,009 sq. mi., including 110 sq.mi. (approximately) of water. Its population in 1950, according to final 1950 U.S. census reports was 2,007,280, an increase of 17.4% over 1940. This was the largest increase of any of the New England states. Population figures for the principal cities (preliminary 1950 census) were: Hartford, the capital, 176,634; New Haven, 164,076; Bridgeport, 158,678; Waterbury, 104,209; Stamford, 73,869; and New Britain, 73,663.

**History.**—At the regular 1949 session of the general assembly, a commission had been appointed to study the organization of state government, make recommendations and draft proposed legislation to carry out its recommendations. By Feb. 1950, the commission had completed its work and was ready to make its report. Gov. Chester Bowles called a fourth special session (he had already called three in 1949) to meet March 9. The commission, in brief, recommended that the approximately 180 departments, agencies, institutions and commissions of the executive branch be grouped and managed in 14 operating departments, to which would be added six others; i.e. (1) executive office of the governor, (2) office of personnel services, (3) office of general services, (4) office of public works services, (5) judicial department and (6) legislative department. The draft of a proposed new constitution was also submitted.

In general, opinion on the report strictly followed party lines. The Democratic governor and the Democratic-controlled senate favoured the report, but the Republican-controlled house opposed it. After more than two months' debate, no real agreement was reached and the session adjourned May 26. Two compromise bills passed, establishing a central purchasing department and a public works department, but they were far from the recommendations of the commission. The debate on the new constitution seemed to arouse the most controversy. A stopgap act concerning temporary rent control was passed in case the federal congress did not continue rent control.

Gov. Bowles called a fifth special session on Sept. 5, 1950, to consider the matter of civilian defense and also to increase the authorized amount of the housing bond issue. Both houses of the general assembly were in agreement on civilian defense, so that a director and suitable appropriation were quickly authorized.

On the question of increasing the existing housing bond issue of \$30,000,000 the governor wished an additional \$60,000,000, but the house would approve only \$30,000,000 increase, which the governor finally accepted.

A few other bills were passed, among them an increase in salaries for state employees in the classified service, and the session adjourned on Sept. 15.

State officers in 1950 were: governor, Chester Bowles; lieu-

JOHN D. LODGE, Republican, elected governor of Connecticut, Nov. 7, 1950

tenant governor, William T. Carroll; secretary of state, Mrs. Winifred McDonald; treasurer, Joseph A. Adorno; comptroller, Raymond S. Thatcher; attorney general, William L. Hadden; superintendent of education, Finis E. Engleman. U.S. senators were Brien McMahon and William Benton.

The election campaign, at which state officers were to be elected for four-year terms instead of two years, resulted in a Republican victory for all state elective offices. John Davis Lodge won over Chester Bowles for governor by a plurality of 17,014; the pluralities in the voting for the other state offices were even smaller. The Democrats retained control of the state senate by a majority of two, 19 to 17. In the previous session, the majority had been 10. In the house, the Republicans increased their majority to 108 from 86.

For the U.S. senate, Democrat Brien McMahon was re-elected over Joseph E. Talbot by a plurality of almost 45,000, and William Benton, Democrat, for the short term defeated Prescott S. Bush by 1,102 votes. The Republicans elected four out of six congressmen.

**Education.**—The state department of education reported the following statistics for the school year 1949-50: there were 678 elementary day schools in the state with 206,214 pupils and 5,694 teachers; 90 high schools with 61,083 pupils and 2,385 teachers; 34 junior high schools with 16,266 pupils and 687 teachers; 197 parochial, ecclesiastical and private schools with 64,587 pupils and 2,692 teachers. The expenditure of the state on public education was \$11,780,069, and local expenditure was \$60,940,424. For the school year 1949-50 there were in the state 30 institutions of higher education, including four state teachers colleges and six junior colleges. Total enrolment was 31,603. There were also 12 vocational-technical schools wholly supported by the state with 307 teachers and 16,756 students. The establishment of four more such schools had been authorized.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—The state public welfare department reported in June 1950 that there were 73,551 persons in the state receiving assistance, compared with 64,393 in June 1949, an increase of 14.2%. The cost of this assistance was \$3,887,420, compared with \$3,204,584 in 1949, an increase of 21.3%. The various types of relief making up the above total were: general local relief, 18,772 persons, costing \$623,752; old-age assistance, 19,715 persons, costing \$1,270,727; aid to dependent children, 17,072 children, costing \$575,852; aid to 334 blind, costing \$19,676; aid to 12,419 persons in mental, feeble-minded and tubercular state institutions, costing \$1,210,923; aid to 3,343 county wards (6-18 years), costing \$143,461; and aid to 2,133 state wards (under 6 years), costing \$43,029. For the year the total welfare outlay was \$26,555,465, an increase of \$7,000,000 over the previous year and \$4,000,000 more than was appropriated. The total expenditure by the state for the year ending June 30, 1950, for charities and hospitals was \$51,709,086, and for health and sanitation \$1,473,307.

**Communications.**—The Federal Communications commission reported that in 1950 there were 27 standard AM broadcasting stations in the state, 14 with frequency modulation (FM), one licensed television station and two experimental stations.

Railroad mileage in Connecticut in 1950 was 830.9 mi. Most of this, 766.76 mi., was operated by the New York, New Haven and Hartford Railroad company (freight and passenger); 59.94 mi. was operated by the Central Vermont Railway, Inc. (freight only); and 4.20 mi. was owned and operated by the Branford Steam railway (freight only).

There were 2,985 mi. of roads in the state highway system, more than 880 mi. of which were concrete. During the fiscal year ending June 30, 1950, 748,488 motor vehicles were registered and 841,564 operators were licensed. Total receipts of the motor vehicle department reached a peak of \$29,446,094.

**Banking and Finance.**—The financial condition of the state at the end of the fiscal year June 30, 1950, according to the state treasurer was as follows: cash balance June 30, 1949, \$26,716,086.22; receipts, July 1, 1949, to June 30, 1950, \$448,881,623.44; total, \$475,597,709.66; payments July 1, 1949, to June 30, 1950, \$456,555,382.19; cash balance, June 30, 1950, \$19,042,327.47. The bonded indebtedness of the state was \$84,039,000 and the bond retirement fund was \$4,189,316. The unemployment compensation fund deposited with the secretary of the treasury of the United States was \$148,537,561.11.

The tax department reported total tax collections for the fiscal year of \$68,454,785 (not including the gasoline tax or motor vehicle fees) as compared with \$59,036,313 in 1949.

The state banking department reported the total assets of banks as of June 30, 1950, as follows: 72 mutual savings banks had assets of \$1,516,185,334; 60 state banks and trust companies had assets of \$849,115,061;

48 national banks had assets of \$777,733,000; seven industrial banks had assets of \$6,819,889; two private banks had assets of \$1,648,187; and 31 building or savings and loan associations had assets as of Sept. 30, 1949, of \$60,461,352.

**Agriculture.**—The department of farms and markets reported that the total cash receipts from farm marketing in 1949 were \$156,294,000, compared with \$162,614,000 (revised) in 1948. From commodity crops, receipts were \$58,198,000; from livestock and livestock products, \$97,703,000; and government payments, \$393,000.

**Manufacturing.**—In Aug. 1949 only 689,820 persons were employed in nonagricultural industries and 106,290 were unemployed. From that time, conditions slowly improved, and by Jan. 1950, 712,370 were employed and the number of unemployed had dropped to 70,500. By Aug. 1950, 757,970 were employed and unemployment was down to 25,400, the lowest since Dec. 1947. In some selected industries, actual labour shortages occurred. Overtime increased the factory time to an average of 42.2 hours per week and the average weekly earnings rose to a record level of \$60.27. Preliminary reports indicated that in Sept. 1950 employment had risen to 775,590 and that unemployment had fallen to 21,600 on Oct. 1.

**Mineral Production.**—The mineral production of Connecticut is all in the nonmetallic field. The value of mineral products for 1948 totalled \$6,745,000. The three chief products in the order of their importance were clay products, stone and sand and gravel. (J. Br.)

**Conservation, Soil:** see SOIL EROSION AND SOIL CONSERVATION.

**Consumer Co-operatives:** see CO-OPERATIVES.

**Consumer Credit.** As the economy of the United States during the year 1950 expanded with an unprecedented volume of production, earning power and retail sales, the credit used by consumers also increased in amount and their outstanding indebtedness at the end of the year exceeded \$20,000,000,000. Simultaneously, because of the supposed influences of credit buying upon the price level and upon consumer expenditure patterns, and as a result of the greater use made of credit, consumer credit was again during 1950 brought under federal regulation. This increase of debt and the resumption of credit regulation were the two outstanding events of the year in this field.

The importance of the increase in consumer credit and debt, however, is not fully apparent merely in the fact that the outstandings increased about \$4,000,000,000, or about 28%, during the year from Sept. 1949 to Sept. 1950. In the first place, this increase in debt does not represent an increase of that amount in goods bought through the use of credit. Price inflation accounted for a large portion of the increase, for according to the Index of Retail Prices published by the U.S. department of commerce, prices rose from 169.1 in Sept. 1949 to 192.3 in the same month of the following year (1935-1939 = 100). When, therefore, the debt outstanding in those respective months is adjusted for the change in the price level, it is found to have increased by but 17% in 1950. This was not much different from its increase in 1949 over 1948, similarly measured, when the deflated volume of debt rose 15.8%. Thus it is apparent that consumer debt increased steadily and at a slightly increasing rate but that the magnitude of the dollar debt was attributable in part to price conditions.

The increase in consumer debt, moreover, was not uniform throughout the various types of outstandings. While on the whole the debt increased 28%, charge accounts outstanding increased but 19% and all noninstalment credit 20%. The largest increase during the 12-month period ending in Sept. 1950 was found in instalment credit, which increased 33%. This was mainly the result of disproportionately large expenditures being made by consumers for automobiles and other durable household goods and of the somewhat longer terms and lower down payments which were then characteristic of instalment selling.

The significance of the volume of consumer debt, however, is appreciable only in the light of the general economic conditions which surrounded the debt. This premise is especially important in view of the fact that conclusions are sometimes based upon dollar data alone or upon percentages unrelated to other facts.

#### Leading Crops of Connecticut

	1950	1949	1939-48 (Average)
Corn, bu. . . . .	1,935,000	1,800,000	2,039,000
Oats, bu. . . . .	190,000	222,000	176,000
Hay, tons . . . . .	481,000	464,000	448,000
Tobacco, lb. . . . .	27,509,000	26,568,000	23,527,000
Apples, bu. . . . .	1,406,000	1,640,000	1,188,000
Peaches, bu. . . . .	104,000	164,000	126,000
Pears, bu. . . . .	52,000	57,000	51,000
Potatoes, bu. . . . .	3,481,000	3,013,000	3,431,000

For example, whereas total consumer debt in 1949 amounted to 8.1% of personal disposable income, in 1950 the ratio was 9.4%. Similarly, whereas in 1949 that debt was 8.3% of personal consumption expenditures, the following year it was 9.7%. Thus it is seen that consumer debt during 1950 increased relatively faster than some other aspects of the economy, but it was still not out of proportion to consumers' disposable income in comparison with the condition existing in 1939 when the debt was 10% of such income. Moreover, while instalment debt increased relatively more than other forms of consumer debt, that was a result of consumers buying commodities commonly sold on instalment plans and it does not appear that the sale of such goods was increased by inordinate use of instalment credit. In Sept. 1949, total instalment debt outstanding was 40.1% of durable goods expenditures; one year later it was but 39.7% of such expenditures.

One may conclude from these facts that while consumer credit and debt reached new highs in 1950, they had not increased out of proportion to other economic phenomena and were more or less normally related to current consumer expenditures.

Nevertheless, because of the impelling necessity to restrain inflation and exorbitant consumption expenditures in an economy faced with preparations for war, consumer credit was viewed as an area where restraining regulations would accomplish several objectives: to relieve upward pressure on prices; to reduce demand especially for specific goods; and to release materials and labour for defense production.

Consequently, the controls on instalment credit known as regulation W were reissued by the federal reserve board, effective Sept. 18 and revised effective Oct. 16, stating requirements of down payments and maturity periods as follows:

*Minimum Down Payments and Maximum Maturities Under Regulation W*

Listed articles and loans	Minimum down payment (per cent)		Maximum maturity (months)	
	Sept. 18— Oct. 15	Oct. 16	Sept. 18— Oct. 15	Oct. 16
<b>Listed articles</b>				
Passenger automobiles . . . . .	33½	33½	21	15
Major appliances . . . . .	15	25	18	15
Furniture and floor coverings . . . . .	10	15	18	15
Home improvement materials, articles and services . . . . .	10	10	30	30
<b>Loans</b>				
To purchase listed articles . . . . .	Same as on instalment sales of articles			
Unclassified . . . . .			18	15

Source: *Federal Reserve Bulletin*, p. 1430 (Nov. 1950).

The immediate effect of this regulation was to decrease the demand for automobiles and for some of the other listed articles. After a short period the market adjusted itself to the conditions and demand increased somewhat. Prices of used automobiles dropped. By the end of the year, however, there was no conclusive evidence of the effect of the regulation upon the general price level, for prices continued to increase and expenditures were thought to be transferred from hard to soft goods.

Thus effort was made to control general conditions of the economy indirectly through restraints upon consumer credit, whereas there is reason to think that consumer credit and debt are mainly effects rather than causes of general economic conditions. (See also *FEDERAL RESERVE SYSTEM*.) (R. BA.)

**Canada.**—In September the dominion bureau of statistics reported that during the second quarter of 1950 instalment buying in the 16 major credit-dealing trades rose to 9.3% of the total sales, compared with 9.2% in the first quarter of 1950 and 8.3% in the second quarter of 1949. During the second quarter of 1950 unpaid instalment accounts increased by 22% and charge accounts by 3% over the first quarter of the year.

The total figure and percentages, from a dominion bureau of statistics estimate for all of 1950, were: total estimated retail trade of \$8,000,000,000; cash sales at the rate of 62.8% (cash

sales stood at 67% in July 1945); instalment sales at 9.3%; charge sales at 27.9%.

In the face of such serious inflationary threats, the August-September special session of the federal parliament passed consumer credit controls, which went into effect on Nov. 1. The government created a consumer credit administration. Restrictions included higher down payments and shorter time to pay off balances. During 1950, up to Nov. 1, the only restrictions on instalment buying in Canada were certain types confined to the provinces of Quebec and New Brunswick.

A survey of the associated credit bureaus of Canada at key points disclosed that in eastern Canada down payments averaged 10% on hard goods whereas in western Canada down payments on similar goods ran from 20% to 33%; 70% of those answering the survey set \$5 as the most desirable minimum monthly payment.

(C. CY.)

**Great Britain.**—During 1950 the main changes in the position of consumer credit in Great Britain occurred in the fields of instalment-purchase and credit sales, in both of which considerable extensions took place. These increases would undoubtedly have been greater but for the government's continuing to hold the opinion that undue instalment-purchase credit had an inflationary tendency and that such transactions, so far as they affected consumer goods, should be therefore restricted. The money available for instalment-purchase sales in these articles was thus still limited; and for this reason many retailers, especially those whose liquid capital was already fully employed, could not handle as many transactions as were offered to them, being unable to obtain additional finance from their bankers or from the specialized houses that cater to this particular need.

The Hire Purchase and Credit Sale Agreement (Maximum Prices and Charges) order came into force on Jan. 23, 1950. Although closely following the previous control orders on this subject, the new regulations had several important effects. The principal one was that, for the first time since the restrictions necessitated by World War II were imposed, a service charge could be made for instalment-purchase facilities upon all articles. The only question which faced the retailer was whether the article that he wished to sell was subject to instalment-purchase control or not: if it was, then the deposit, the maturity and the service charge were all regulated, together with one or two minor matters, mainly of detail; if it was not, then the terms could be negotiated between the trader and his customer. Although it might seem that the new order greatly widened the field over which instalment-purchase transactions could be extended, in effect the change was not so great as would appear, as in the main the majority of items suitable for instalment-purchase had already been covered.

The position at the end of 1950 therefore was that instalment-purchase terms were controlled: (1) upon all price-controlled goods, other than new sewing machines, dictaphones, typewriters, and office machinery generally; (2) upon all domestic furniture, whether price-controlled or not; (3) upon all bedding, whether price-controlled or not. Upon all other items, deposit, maturity and service charge were matters for agreement between the two parties.

In all cases (whether the control order applied or not) the agreement was subject to the provisions of the Hire Purchase act of 1938 for such transactions as fell within its scope; *i.e.*, generally speaking, transactions where the total instalment-purchase price was £100 or less.

A further legislative change affecting instalment-purchase credit was the repeal as from Oct. 9, 1950, of the Courts Emergency Powers act. This repeal made it legal again for an owner (subject to the relevant provisions of the Hire Purchase act) to recover goods let on an instalment-purchase agreement, where

the customer had become in arrears with his payments, without first having to obtain the sanction of the courts. (C. C. Ws.)

**Contract Bridge.** Bridge-playing in the United States was not much affected by the sudden popularity of canasta (*q.v.*) except that those taking up card playing for the first time were apparently learning canasta instead of contract bridge, as evidenced by a sharp drop in the sale of bridge instruction books while the sale of bridge playing cards remained about the same. Attendance at bridge tournaments increased.

There was no change in the laws of contract bridge during 1950 since the existing laws, published in 1948, were guaranteed to remain unchanged for at least five years. For the first time in several years, however, new trends in bidding appeared. Principal among these was a shift in methods of hand valuation. Millions of players who for years had valued their hands by "honour-tricks" began instead to use a "point count" in which an ace counts 4 points, a king 3, a queen 2 and a jack 1, with various methods of valuing long and short suits. A bidding innovation that became popular was the "Stayman convention" of no-trump responses, which spread more rapidly than had any other convention since Easley Blackwood's slam method was introduced in the 1930s.

The international team matches played in Bermuda in November between teams from the United States, Great Britain and the European Bridge league came much closer than had any matches before to representing a world championship contest (*see below*). However, South America was not represented, nor were Negro bridge players of the United States.

Winners of the principal championship contests of the American Contract Bridge league in 1950 were:

*Masters' individual:* Morrie Elis, New York city.

*Masters' teams:* Howard Schenken, George Rapee, Samuel M. Stayman, New York city; John Crawford, Sidney Silodor, Philadelphia, Pa.

*Masters' pairs:* C. W. Yorke, Manuel Sherwin, Flint, Mich.

*Open teams, cumulative scoring (Vanderbilt cup):* Schenken, Rapee, Stayman, Crawford and Oswald Jacoby of Dallas, Tex.

*Open teams, match-point scoring:* Charles H. Goren, Sidney Silodor, Philadelphia; Mrs. Helen Sobel, Myron Field, B. Jay Becker, New York city.

*Open pairs:* Jack Kushner, Springfield, Mass.; Mark Kelleher, Stratford, Mass. (A. H. Md.)

**Great Britain and Europe.**—The three-cornered world championship match at Bermuda was won by the U.S., with Europe second and Great Britain third. The U.S. team comprised H. Schenken, J. Crawford, G. Rapee, S. Stayman, C. Goren and S. Silodor; the European, J. Werner, N. Nilliehook, R. Coch and J. Wohlin (Sweden) and E. Thorfinnsson and G. Gudmundsson (Iceland); and the British, M. Harrison Gray (captain), J. Tarlo, L. W. Dodds, K. W. Konstam, L. Tarlo and N. Gardener. Each team played 144 boards against each other team. The margins were: the U.S. beat Britain by 3,660 and Europe by 4,720; Europe beat Britain by 1,940.

For the third year in succession Great Britain, after a very close finish, won the European championship, which was held at Brighton from June 4 to June 11. Sweden was again second, Iceland was third and Italy fourth. Great Britain also won the ladies' championship, for the first time; Belgium was second and France third.

The Camrose cup, an international contest between England, Scotland, Wales, Northern Ireland and the Bridge Association of Ireland, was easily won by England.

The Waddington cup for masters' pairs was won by R. Sharples and J. Sharples; K. W. Konstam and G. Mathieson were runners-up. The Gold cup was won by J. T. Reese's team (J. T. Reese, B. Schapiro, A. Meredith, H. Leist, S. Lee and Mrs. A. L. Fleming). Crockford's cup was won by Mrs. A. L. Fleming's team (Mrs. A. L. Fleming, E. Bruce Parker, J. T. Reese, B. Schapiro,

K. W. Konstam and G. Mathieson).

Four major congresses were held during the year: by the English Bridge union at Harrogate, by the London association at Earls Court and two, by the Tournament Bridge association and the English Bridge union, at Eastbourne.

On the technical side the Acol system strengthened its hold among leading tournament players and was played by 15 of the 22 partnerships in the masters' pairs. (T. REE.)

**Co-operatives.** During 1950 the co-operatives made substantial progress in almost every field. Total membership in the U.S. was considerably in excess of 10,000,000 and the estimated world membership was 140,000,000.

The credit co-operatives or credit unions, which had the largest membership of any type of co-operative in America, added more than 100,000 new members in a special campaign, and reported more than 5,000,000 members in the U.S. with another 1,000,000 in Canada, Hawaii, Puerto Rico and Jamaica.

The rural electric co-operatives, which constituted another large section of the co-operative movement, added 380,000 subscribers. Rural electric co-operatives served more than 3,000,000 members in the U.S. and brought electric light and power to millions of farm homes. Twenty co-operative telephone lines or extensions of existing co-operative lines were launched during the year.

In the field of co-operative housing, the U.S. congress rejected by a narrow margin a proposal to create a co-operative housing administration which would be responsible for the promotion and development of co-operative housing projects in the country, with low-cost government loans and 50-year amortization mortgage payments. The law as adopted established a co-operative section within the Federal Housing administration to assist in development of co-operatives as part of the regular work of FHA. By the close of 1950 applications had been submitted for \$200,000,000 worth of co-operative housing projects under this program, and a few of these projects were already under construction. More than 100 co-operative housing projects serving 30,000 families were in operation before the FHA program got under way.

#### Consumer Co-Operatives in the U.S., Jan. 1951

Type of associations	Number of Associations	Membership†	Volume of business
<b>Commodity co-ops</b>			
Co-operative stores . . . . .	2,400	1,356,000	\$ 828,000,000
Service stations . . . . .	2,500	960,000	385,000,000
Farm supply . . . . .	1,353	710,000	480,000,000

\*Includes Canada.

†Includes only those organizations affiliated with the Insurance Conference of the Co-operative League of USA. Mutual insurance companies reported by the U.S. bureau of labour statistics include 2,000 associations, with 11,300,000 members and business of \$207,500,000.

‡Many individuals are members of several co-operative associations. Source: Compiled from figures issued by the U.S. Bureau of Labor Statistics, the Farm Credit Administration and the Cooperative League of USA.

Very few co-operative food stores were opened during the year, but most of the established retail units continued to grow in membership and volume of business. About 1,000 co-operative food stores handled an estimated \$100,000,000 worth of food-stuffs during the year.

Bulking largest in all co-operative activity in the United States were the co-operative marketing and farm supply associations. The marketing associations reported 3,600,000 members

with a business of \$7,195,000,000 by the close of 1948. The marketing co-operatives handle such diverse commodities as cotton, dairy products, fruit and vegetables, grain, dried beans and rice, livestock, nuts, poultry, tobacco, wool and other products.

The parallel co-operative purchasing associations buying feed, seed, fertilizer and other farm supplies, numbered in their membership 2,260,000 farmers. Business for the 1950 season was estimated at well above the \$1,440,000,000 mark which had been its previous record.

Co-operative petroleum associations weathered a severe economic storm which wiped out many other small independent refining companies as the industry went further into catalytic cracking and other expensive processing methods. The oil squeeze ended with the invasion of Korea when petroleum again came into short supply. Petroleum co-operatives, in addition to serving 960,000 farm and city consumers, operated 20 petroleum refineries, 1,500 oil wells and nearly 2,000 miles of pipe line.

The Insurance Conference of the Cooperative league, made up of 14 companies, reported continued rapid growth in this field. The number of individuals insured was 4,045,000 by the end of 1950. Insurance in force, which had reached \$830,000,000 by the end of 1949, was estimated to have passed the \$1,000,000,000 mark. A more accurate measure of operations was the premium income of \$67,000,000 with admitted assets of \$95,910,000. For the first time the investments by these insurance companies in other co-operatives became a substantial figure.

In the international field the co-operatives loomed large as a factor in the United States Point Four program for aid to underdeveloped countries. They also became an important factor in the technical assistance program of the United Nations. Under these programs co-operative marketing of farm products, purchasing of farm machinery, fertilizer and other farm supplies, co-operative development of irrigation systems, electric power, handicraft industries, etc., were essential in increasing the standard of living in all of the underdeveloped countries.

Both the agricultural marketing co-operatives and the consumer co-operatives participated actively in the programs of the Food and Agriculture organization and the Economic and Social council of the United Nations.

Two operating co-operatives in the international field continued to perform an outstanding international public service. They were CARE (Cooperative for American Remittances to Europe), which had distributed more than \$100,000,000 in food and textile packages overseas since 1945, and the International Cooperative Petroleum association which supplied oil and other products from co-operatively owned oil wells, pipe lines and refineries to farm and city consumers in such diverse areas as South Africa and the Scandinavian countries.

Characteristic of all of these co-operatives was open membership, democratic control and nonprofit operation which had been cardinal principles of co-operative enterprise for more than 100 years. (See also FARM CREDIT ADMINISTRATION.) (W. J. CL.)

**International Co-operative Alliance.**—During 1950 the International Co-operative alliance held together formally, but was rent by serious disputes between two groups, one from either side of the "iron curtain." The principal controversies during 1950 turned on the soviet demand that the I.C.A. should associate itself with the peace congress movement and on the conditions to be laid down for dealing with new applications for membership. Among the applicants were the reorganized co-operative movements of Hungary and eastern Germany which the committee decided not to consider individually until it had made a general interpretation of the rule governing membership and which were eventually refused admission. Administratively, the I.C.A. was firmly in the hands of the western co-operators.

In 1950 the I.C.A. submitted to the United Nations Economic

and Social council a resolution demanding that world oil resources be brought under the control of the United Nations. To increase its influence with U.N., the I.C.A. decided to appoint permanent co-operative representatives at Geneva and at Lake Success; it also acquired new headquarters in London and decided to increase its contribution rates to cover these additional costs. It was further determined to set up an agricultural auxiliary (to represent various agricultural co-operatives) and to make special efforts to promote joint working between the agricultural and the consumers' movements.

**Great Britain.**—In Great Britain the Co-operative union recorded for 1949 further increases in both membership and trade but experienced a further fall in rates of dividend on purchases. Membership of retail consumers' societies rose by 250,000 to 10,413,618, and the value of retail trade increased by £46,000,000 to £549,000,000; but the average rate of dividend fell from 1s. 5½d. to 1s. 4½d. on the £1. This continuing fall in dividend rates was partly the result of the societies' reluctance to raise prices; but the policy adopted had little effect in diverting trade from the movement's rivals. As far as it was possible to judge, the co-operative share in total retail trade fell a little, or at best was barely maintained, partly because it was greatest in the trade in basic foods, on which consumers spent a diminishing fraction of total income (on account of public subsidies as well as of changing demand).

During the last months of 1949 and the early part of 1950 the co-operative leaders complained to the Labour party that they had not been consulted on the plans for further nationalization included in the election program and demanded prior consultation about any future projects. The Labour party, under pressure, abandoned its scheme for nationalizing industrial insurance, which threatened the Co-operative Insurance society, and substituted a scheme of "mutualization," of which nothing was heard after the election.

**Other Countries.**—In Europe governments east of the "iron curtain" took further steps to bring the co-operative societies under Communist control, especially the peasant co-operatives, which were being gradually forced into the framework of a collective system. In Yugoslavia on the other hand the tendency was to encourage more co-operative autonomy and to stimulate measures of workers' control in the factories as a counterblast to soviet insistence on "democratic" centralism. There was a further recovery of consumers' co-operation in western Germany, including a notable revival of wholesale co-operation. Italian co-operation also recovered further, but was rent by doctrinal disputes. The Chinese movement underwent extensive reorganization after the Communist victory; but the government appeared to be handling the situation carefully, in order not to disturb the foundations of rural credit.

(G. D. H. C.)

**Copper.** World production of copper declined by 4% in 1949 in spite of sharp increases in Northern Rhodesia and Canada, the gains being more than offset by losses in Chile, the United States and Belgian Congo. The outputs of the major producing countries and the world totals during recent years are

Total . . .	972.5	772.9	608.7	847.6	834.8	752.8

Mine and smelter output in 1949 declined 10%, refinery output 16%, and refinery output from domestic ores 19%. Imports increased, and although exports and secondary recovery declined, the supply available for use was down 16%. The drop was partly caused by strikes in the mines and smelters, and partly by a shift to a 40-hr. week.

In 1950 higher prices and increased demand advanced mine output to 666,943 tons in the first three quarters.

**Canada.**—An advance in primary copper output from 240,732 tons in 1948 to 262,991 tons in 1949 continued in 1950, with 173,906 tons in the first seven months; the corresponding refinery figures were 221,275 tons, 226,083 tons and 160,872 tons. (See also MINERAL AND METAL PRODUCTION AND PRICES.)

FILMS OF 1950.—*Copper Mining and Smelting* (Encyclopædia Britannica Films Inc.). (G. A. Ro.)

**Corn** (MAIZE). The 1950 U.S. corn crop of 3,131,790,000 bu., of which 2,845,000,000 bu. were harvested for grain, was 7% less than the 3,379,436,000 bu. of 1949, but 8% above the 1939-48 average. It appeared that this crop would not be sufficient to meet the feeding needs of the expanding livestock population, and that the Oct. 1, 1950, record carry-over of corn (859,280,000 bu.) would be partially used.

Table I.—The U.S. Corn Crops

	1950	1949	1948	Average, 1939-48
Total production (thousands of bu.) . . .	3,131,009	3,379,436	3,681,795	2,900,932
Acres harvested (thousands) . . .	83,302	87,029	86,067	88,007
Yields (bushels per acre) . . .	37.6	38.8	42.8	32.9

Acres harvested in 1950 declined to 83,302,000, as compared with 87,029,000 in 1949 and 88,007,000 average for 1939-48. The farmers only partially complied in 1950 with the government request for a sharp cut in acres planted in corn; by late 1950, the situation was sufficiently changed that all acreage restrictions were removed from the 1951 crop and something like

90,000,000 ac. were hoped for. Average yields per acre also declined to 37.6 bu. compared with 38.8 bu. in 1949, but continued well above the ten-year average of 32.9 bu.

Table II.—U.S. Corn Production by Leading States

(In thousands of bushels)						
State	1950	1949	Average, 1939-48	State	1950	1949

Michigan . . .	64,796	85,920	56,482	West Virginia . . .	9,287	11,748

Corn prices tended generally upward during much of the year. The average price for the 1950 crop was preliminarily estimated at \$1.45 per bushel, as compared with \$1.24 per bushel for the 1949 crop, or a total value for the 1950 crop of \$4,535,607,000. The government support level was \$1.47 per bushel national average on the 1950 crop. Exports were estimated at 125,000,000 bu. in the year beginning Oct. 1, as compared with 110,000,000 bu. in the previous year.

The world corn crop of 1950-51 was forecast at 5,285,000,000 bu., compared with 5,580,000,000 bu. in the previous year and a prewar average of 4,750,000,000 bu. (See also FOOD SUPPLY OF THE WORLD; LIVESTOCK; VEGETABLES.) (J. K. R.)

**Cortisone:** see ARTHRITIS; BIOCHEMISTRY; CHEMOTHERAPY; ENDOCRINOLOGY; HEART AND HEART DISEASES; INTOXICATION, ALCOHOLIC; MEDICINE; PHYSIOLOGY.

**Cosmic Rays:** see PHYSICS.

**Costa Rica.** A Central American republic, Costa Rica is located between Nicaragua and Panamá. Area: 19,238 sq.mi.; pop. (Dec. 31, 1949, official est.): 850,659, classified as about 80% white, 16% mixed, 3% Negro and less than 1% Indian. The capital is San José (pop. in 1949: 79,694); other principal cities are: Alajuela (11,187), Cartago (11,624), Guadalupe (15,966), Heredia (10,730), Liberia (3,061), Limón (12,666), Puntarenas (12,329), Tibás (5,227) and Turrialba (5,316). Language: Spanish; religion: predominantly Roman Catholic. President in 1950: Otilio Ulate Blanco.

**History.**—The political highlight of the year 1950 was the discovery and frustration of a revolutionary plot. According to the official announcement, issued Aug. 12 by President Ulate, the conspiracy involved several partisans of former Pres. Rafael Angel Calderón Guardia and a number of Communists. Among the 300 persons arrested as suspects was Manuel Mora, leader of the Vanguardia Popular, the outlawed Communist party. Mora had returned to the country in April after two years of exile in Mexico. Many of those arrested were released shortly afterward, and the incident passed without a suspension of constitutional guarantees.

Financial matters occupied the bulk of the government's attention during the year. The black market in foreign exchange was undercut early in April by a law creating a legal free market, and the free rate for the national monetary unit fell in a few days from 8.9 to 7.4 per U.S. dollar. On Sept. 22 a stock exchange was opened in San José with a capital of 600,000 colones. Although about 60% of the shares were owned by the nationalized banks and other government organizations, the market was reportedly under private management.

On July 27 the council of ministers decided that Costa Rica would support the United Nations' action in the Korean crisis, and offered volunteer soldiers and sites for air and naval bases to the U.N. forces.

**Education.**—In 1948 there were 919 primary schools with 99,550 students and 44 secondary schools with 10,055 students. The national university had 907 students and 180 professors in 1945. With the abolishment of the army in Jan. 1950, the country had more school teachers than soldiers. Approximately 17% of the 1950 national budget was allocated to public education.

**Finance.**—The monetary unit is the colón, valued officially at 17.6 cents U.S. and on the uncontrolled market at 11.3 cents on Oct. 31, 1950. The national budget for 1950 provided for expenditures of 108,000,000 colones; the proposed budget for 1951, 134,824,000 colones. In 1949 actual expenditures were 125,397,000 colones; actual revenues, 125,423,000 colones, leaving the first recorded surplus since 1940. At the close of 1949 the foreign debt amounted to 147,117,139 colones; the internal debt, 267,761,789 colones. At the end of June 1949, the central bank held gold reserves totalling 11,547,000 colones; total bank deposits were 63,128,000 colones; currency in circulation, 103,410,000 colones.

**Trade and Resources.**—Exports in 1949 were valued at \$31,440,000 (\$31,839,000 in 1948); imports, at \$43,350,000 (\$42,344,000 in 1948). During the first 6 months of 1950 exports were up 5.5% and imports down 11.0%. The chief exports (with 1949 values) were: bananas (\$11,815,410), coffee (\$10,005,000), abacá fibre (\$2,534,000), cacao (\$2,319,000) and sugar (\$1,038,000). The United States took 75% of the exports and supplied 75% of the imports in 1949. Increased banana planting during 1950 was expected to make Costa Rica the leading producer in the world by 1951 with a yield of more than 13,000,000 stems. The 1950 coffee crop was 500,000 bags of 132 lb. each, about 150,000 bags over the 1949 crop. In 1949 industrial production was valued at approximately \$44,652,000, of which \$13,728,000 was paid to about 65,000 workers.

**Communications.**—At the end of 1947 there were 414 mi. of public and 255 mi. of private railroad and 1,014.9 mi. of improved highways. At the end of 1948 there were 4,005 automobiles and 2,845 trucks and buses registered. Domestic air-line passenger flights reached a record in 1949 with 120,000 passengers and 13,000,000 lb. of cargo being flown; international flights carried 34,000 passengers and 2,300,000 lb. of cargo. At the end of 1949 the merchant marine had one ship of 1,000 tons. In 1948 the country had 32,000 radios and 7,100 telephones.

**Cost of Living:** see BUSINESS REVIEW; PRICES.

**Cotton.** **Cotton Manufacture.**—The increased rate of activity in the U.S. cotton industry which began in the second half of 1949 continued in 1950, with additional stimulation provided by international events in June and thereafter, pushing the industry to boom levels. At the year's end, mills were booked up with orders well into the second quarter of 1951.

Production in 1950 was about 26% more than in the previous year and the largest since 1943. On a linear yardage basis, 1950 production was up about 1,700,000,000 yd. Production during the first nine months of the year was 7,245,449,000 yd., compared with 6,091,669,000 yd. in the corresponding period of 1949. In the final quarter production was running 25% higher than in the same quarter of 1949; operation during November was at a rate of 143% capacity on a two-shift 80-hr. week basis. Prices advanced as much as 27% on some standard cotton textiles during the year; a price index for 17 basic cotton gray goods registered 69.07 cents per pound in January, declined to 64.65 cents in May, then rose to 89.16 cents at the end of October.

The U.S. continued to hold a considerable share of the world's textile export market, but cotton cloth exports declined 41% during the first ten months of 1950 to 457,126,000 yd. as compared with 771,476,000 yd. for the same period of 1940.

**United States Production.**—Unlike 1949, when the raw-cotton surplus and its temporarily unsolved problems were the dominant factors in the situation, the short 1950 crop in the face of a mounting demand presented a new and very different set of problems. The U.S. cotton crop of 1950 of 9,884,000 bales (of 500-lb. gross weight) was one of eight since 1900 of less than 10,000,000 bales, whereas the 16,128,000-bale crop of 1949 was the largest since 1937 and the fourth largest on record. The average for the preceding ten-year period was

11,599,000 bales. Because of unfavourable weather and heavy boll weevil damage, the estimated lint yield per acre dropped to 265.4 lb., little more than the ten-year average of 261.3 lb. and low compared with 284 lb. in 1949 and 312.6 lb. in 1948. Acreage harvested in 1950 was 17,850,000, the third smallest since 1884 and comparable with 27,230,000 ac. in 1949 and the 21,282,000-ac. average for 1939-48. Only 18,654,000 ac. were planted to cotton, the smallest since 1885, partly because of wet weather at planting time and some labour shortage, but more especially because the government, with what then appeared to be a serious surplus of cotton on its hands, and fearful of another large crop, set the acreage allotment at 21,600,000 ac. and put cotton under marketing quota controls. Texas produced about 30% of the crop.

The 1950 crop of American Egyptian cotton was 58,300 bales, whereas only 4,000 bales were produced in 1949, but the average for 1939-48 was 27,800 bales.

U.S. Cotton Production by States

(In thousands of 500-lb. bales)

State	1950	1949	Average 1939-48
Texas	2,900	6,040	2,729
Mississippi	1,340	1,487	1,653
Arkansas	1,100	1,632	1,393
California	930	1,268	501
Alabama	570	852	912
Georgia	495	604	769
Arizona	440	543	188
Louisiana	430	650	536
South Carolina	400	554	738
Tennessee	400	633	541
Missouri	253	462	373
Oklahoma	230	610	502
New Mexico	190	276	133
Florida	14	16	13
Virginia	5	20	23
Other states	7	15	16

Cotton prices during 1950 set a new record high since 1870 when they reached 44.14 cents per pound on the December futures on the New York Cotton exchange. The previous record was 43.75 cents per pound made in July 1920. Prices to growers which stood at 26.47 cents per pound in January, before the condition and probable size of the 1950 crop was indicated, and before international affairs took a serious turn, rose to 40.36 cents per pound in December. The probable average price for the 1950 crop was indicated at 40 cents per pound, compared with 28.58 cents average for the 1949 crop, though there was some concern near the year's end about the level of a probable ceiling price, inasmuch as cotton was one of the few agricultural products well above parity, which in Dec. 1950 was 32.36 cents per pound.

The average government loan rate on 1950 seven-eighths-inch upland cotton to producers was 27.90 cents per pound but only small amounts were included because of the higher market price, which by the year's end had allowed the C.C.C. (Commodity Credit corporation) to dispose of practically all of its once large

COTTON CROP in the United States. The figure for 1950 is the department of agriculture's estimate

holding (which amounted to about 6,500,000 bales at the beginning of 1950) at a profit.

Exports of cotton from the U.S. were a problem in reverse of the usual. In 1949 and early 1950 exports were strongly pushed. Later in the year when it became clear that world demand was insistent, prices inflating, C.C.C. stocks melting and the 1950 crop a small one, export allocations were ordered, the first comprising 2,000,000 bales for the period Aug. 1, 1950, to March 31, 1951. This caused some controversy; the allocation for the eight months was later increased to about 3,854,000 bales.

In summary, the 1950 crop of 9,884,000 bales, plus a carry-over of 6,748,000 bales, provided a total U.S. supply of about 16,632,000 bales against a probable domestic consumption of at least 10,000,000 bales and an export of perhaps 4,500,000 bales, thus leaving a probable carry-over as of Aug. 1951 of about 2,000,000 bales. This rapidly emerging tight supply situation, in contradistinction to a worrisome surplus only a year before, resulted in the U.S. department of agriculture's announcing that all curbs in the form of acreage allocations and marketing quotas were removed for the 1951 crop; that at least 27,000,000 planted acres and a 16,000,000-bale crop were officially desired; and that the 1951 crop would be supported at 90% of parity instead of a lower price level, which would have been permitted under the law.

**World Cotton Production.**—World cotton production in 1950 was 14% smaller than in 1949. The preliminary estimate for the crop for 1950–51 indicated 26,925,000 bales compared with the 31,190,000 bales of the previous year, and 31,695,000 bales average during 1935–39. Acreage declined to 65,370,000 from 68,770,000 in 1949, but was substantially below the 81,142,000 ac. of pre-World War II. Mexico harvested 1,800,000 ac. against 1,416,000 ac. in 1949, producing a record crop of 1,040,000 bales, or three times the prewar average. India increased production to 2,650,000 bales from 2,300,000 bales the previous year. Egypt reported a near record crop of 2,000,000 bales. The crop was also believed to be larger in China and the U.S.S.R. than in 1949.

World total cotton carry-over from previous crops increased to 16,600,000 bales, from 14,900,000 bales in 1949, but was low compared with the 1935–39 average of 17,352,000 bales. The carry-over was expected to drop sharply by Aug. 1, 1951. Total world consumption was expected to increase to at least 29,200,000 bales or fully 800,000 bales more than in the previous year. World cotton export was 12,300,000 bales in 1949–50, or 1,600,000 bales larger than in the previous year.

**Cottonseed.**—U.S. production of cottonseed, a derivative of fibre production, which is used as an edible oil base for margarine, was estimated preliminarily at only 4,005,000 tons for 1950, compared with 6,559,000 tons in 1949, and a ten-year average of 4,730,000 tons. The government support price program on cottonseed, set equal to 75% of effective parity price, translated into a loan of \$51 per ton or purchase at \$47 per ton, was not much used because the average price to producers at harvest-time was about \$71 per ton and in December \$102 per ton. World cottonseed production was estimated at 12,800,000 tons, 11% less than in 1949–50 and 16% less than the pre-World War II average.

**Cricket.** In the winter of 1949–50 a visiting Australian team beat the South Africans in four out of five tests (the other was drawn). A second Australian team visited New Zealand and asserted clear superiority in the five first-class matches played. In the domestic Australian season South Australia secured the Sheffield shield. For the first time in 15 years Wellington won the Plunket shield in New Zealand.

A commonwealth eleven had a long and successful tour in India and Pakistan but lost the odd game of the three unofficial tests finished.

The main interest of the English season of 1950 centred around the visit of the West Indian team (captain, J. D. Goddard). The burden of their attack was in the hands of two young bowlers of less than medium pace and with practically no previous experience of first-class cricket: A. L. Valentine and K. T. Ramadhin in the four matches together took 59 wickets at an over-all average cost of 21 apiece, bowling 367 maidens in a total of 800 overs, more than double the number bowled by all the other members of the side. In batting the West Indies could command an invaluable combination of soundness and aggression. The opening pair were generally A. F. Rae and J. V. Stollmeyer. After these two would come E. D. Weekes, F. M. Worrell and C. L. Walcott.

The visitors' defeat by the Marylebone Cricket club at Lord's was rather unexpected; and their defeat by 202 runs in the first test, at Manchester, at the beginning of June, greatly disappointed them. They were 97 behind England's 312 on the first innings. England's second total was 288.

A fortnight later, however, on a perfect wicket, the West Indian team won the next test match at Lord's by the devastating margin of 326 runs. When Valentine and Ramadhin took complete charge of the bowling, 10 wickets fell for 89 runs in England's first innings.

In the third test, on the Trent Bridge ground at Nottingham, England made 223 and the West Indies 558 in the first innings. In the second, when England had lost only 5 wickets for 408, there seemed a good chance of a draw. But in the end the West Indies had but 105 runs to win, which their opening pair made.

In the last test match at the Oval the West Indies began by making 503, and the last English wicket fell with 9 runs still needed. In the second innings England could make nothing of Valentine (6 for 39) or Ramadhin (3 for 38).

In the domestic English season the Gentlemen set the Players 253 to get in two and one-half hours; and when time came, with the last batsman in, only 11 runs were needed.

Cambridge university's eleven had G. H. G. Doggart, J. G. Dewes and D. S. Sheppard, who all played for England in test matches, and P. B. H. May, like Sheppard a freshman, who was little behind them in skill. In the university match Oxford did very well, mainly because of C. B. Van Ryneveld's spinners, to dismiss so strong a batting side for 200 on the first day, but the game drifted to a draw.

In county cricket Surrey, by a victory over Leicestershire in their last match, caught Lancashire on the tape and tied with them for the championship. Yorkshire, with a young side, trod hard upon their heels; and Warwickshire, which finished fourth, was the only county to defeat the West Indian team.

In school cricket Harrow had rather the better of Eton in a drawn match.

(H. S. A.)

**Crime.** **United States.**—Crime in 1950 continued the upward course recorded in 1949. The net increase in cities was not large, but in rural areas the sharp upswing that followed the urban and rural declines of 1948 was extended into 1950 at an undiminished pace.

Cities showed marked changes chiefly with respect to negligent manslaughter (chiefly highway traffic deaths) which reversed a marked 1949 decline with an amazing rise in 1950. Auto thefts also reversed their downward tendencies in 1949 with a 1950 rise.

Table I compares 1950's crime fluctuation in city and country. Among other contrasts, this table shows that the three crimes which declined in city frequency (murder, rape and robbery) increased in the rural districts.

**Table I.—Crime Changes in U.S. Cities and Rural Areas—January to June 1949 and 1950**

Offense classification	Per Cent Change in 1950	
	Cities	Rural Areas
Murder and nonnegligent manslaughter . . . . .	- 1.1	+ 1.6
Negligent manslaughter . . . . .	+19.8	- 3.7
Rape . . . . .	- 4.6	+ 4.8
Robbery . . . . .	- 3.8	+ 3.4
Aggravated assault . . . . .	+ 0.4	+ 4.7
Burglary . . . . .	+ 1.9	+14.9
Larceny . . . . .	+ 2.2	+ 5.6
Auto theft . . . . .	+ 3.2	- 3.9
Total . . . . .	+ 1.9	+ 7.4

Based upon returns from more than 3,000 cities, villages and rural townships, 2,000 sheriffs and most state police organizations, the estimated national total of major crimes and larcenies in 1949 was 1,763,000, representing an increase of 77,000 over 1948. Thus an average day in 1949 produced almost 300 homicides or felonious assaults, 162 robberies, more than 1,100 burglaries, almost 450 auto thefts and some 2,800 larcenies of other property.

Urban and rural crime rates for 1950 appear in Table II.

**Table II.—Urban and Rural Crimes: Semiannual Rates per 100,000 Population, January to June 1950**

Offense classification	Urban	Rural
Murder and nonnegligent manslaughter . . . . .	2.76	2.83
Negligent manslaughter . . . . .	1.77	2.27
Rape . . . . .	6.03	6.00
Robbery . . . . .	30.0	10.1
Aggravated assault . . . . .	39.4	18.6
Burglary . . . . .	211.5	92.2
Larceny . . . . .	499.1	113.3
Auto theft . . . . .	83.8	23.1

In 346 cities with more than 25,000 population (total population 37,480,000) the value of property stolen in 1949 totalled more than \$108,000,000. Auto thefts recorded the highest average value at \$835. This was followed by robberies at \$172, burglaries at \$116 and miscellaneous larcenies at \$56. In the group of cities specifically under review, recovered property represented 62.4% of the theft total in 1949. But if the high recovery rates for motor cars is excluded from the reckoning the recovery rate drops to 22.6%. Nonetheless the record of recoveries improved in 1949 over 1948.

Among the nine geographic divisions, the south Atlantic and south central cities led in murders and in assaults with lethal weapons.

The Pacific coast, on the other hand, was consistently highest for all of the property crimes, with cities of the mountain area generally in runner-up position. As in past years the New England and middle Atlantic cities divided honours for the lowest region-wide rates.

During the first six months of 1950, the FBI in Washington, D.C., received and filed the arrest and identification records of 402,383 individuals who had been taken into custody by local, state and federal law enforcement officers. The peak age of such arrests was 21 years, followed by those who were 22, 23, 19 and

"THE GREAT GAMBLING INVESTIGATION," a cartoon by Pease published in the *Newark Evening News* during 1950

20 years of age. Women represented only 9.4% of the total. The white race predominated with 293,298 arrests in this six months period, 103,677 were Negroes, and the small balance was made up of Indians, Chinese, Japanese and other races.

**Table III.—Range in Semiannual Crime Rates per 100,000 Population in Cities Grouped by Geographic Divisions; January-June 1950**

Offense classification	Highest Rate	Lowest Rate
Murder and nonnegligent manslaughter . . . . .	East south central . . . 8.26	New England . . . 0.68
Robbery . . . . .	Pacific . . . . . 57.3	New England . . . 9.0
Aggravated assault . . . . .	South Atlantic . . . 121.4	New England . . . 5.5
Burglary . . . . .	Pacific . . . . . 362.3	Middle Atlantic . . 120.8
Larceny . . . . .	Pacific . . . . . 1,078.5	Middle Atlantic . . 213.4
Auto theft . . . . .	Pacific . . . . . 149.0	Middle Atlantic . . 149.0

A feature of the year was the program of the U.S. senate's special committee to investigate organized crime in interstate commerce. Its hearings, conducted under the chairmanship of Senator Estes Kefauver of Tennessee, were directed chiefly at gambling offenses in major urban centres. (See also FEDERAL BUREAU OF INVESTIGATION; JUVENILE DELINQUENCY; LAW; MUNICIPAL GOVERNMENT; POLICE; SECRET SERVICE, U.S.).

**BIBLIOGRAPHY.**—Federal Bureau of Investigation, *Uniform Crime Reports for the United States and Its Possessions* (semiannual bulletins) for 1949 and first half of 1950. (Br. S.)

**Great Britain.**—In 1949 the number of persons in England and Wales found guilty of offenses of all kinds was 650,497, of whom 114,294 had committed indictable offenses, 523,563 nonindictable offenses and 12,640 offenses against defense regulations, a decline of 15,090, 4,003 and 7,523 respectively against the figures for 1948. Traffic offenses accounted for 50.2% of the total. Of those found guilty of indictable offenses, 99,054 were males and 15,240 females. The age-distribution remained almost unchanged: 22% were less than 14 years old, 13% between 14 and 17, 11% between 17 and 21, 23% between 21 and 30 and 31% over 30.

Indictable offenses known to the police decreased from 522,684 in 1948 to 459,869. In the metropolitan police district the figure per 1,000 of the population went down from 15.1 to 12.6 (before World War II it had been between 10 and 11). The decline was largely confined to the various categories of theft and breakings, whereas the more sophisticated types of offenses against property, such as receiving, frauds and false pretenses, showed a considerable increase. Sexual offenses also rose from 10,922 to 12,015, crimes of violence only slightly—from 5,183 to 5,235. In view of the alarm caused by a number of serious acts of violence committed by young people, which led to debates

in the houses of parliament and demands for the reintroduction of corporal punishment (abolished by the Criminal Justice act, 1948), a special home office paper giving statistical information on the subject for the years 1946 to 1949 was published in May 1950. From this it appeared that the total of "floggable" crimes of robbery known to the police had declined from 978 in 1948 to 860 in 1949, and the number of persons found guilty of such acts from 448 to 414; but the numbers of offenders between 14 and 17 years of age and between 17 and 21 had risen slightly, from 44 to 50 and from 87 to 96 respectively. One hundred cases of murder, involving 114 persons aged one year and over, became known to the police. Sixty-one persons were arrested in 59 cases, involving 67 victims: 12 of them were found unfit to plead, 12 guilty but insane and 1 insane after conviction and 17 were executed; 34 committed suicide.

In Scotland the total of persons convicted or found guilty in 1949 was 92,778, of whom 90.9% were males. The highest incidence was in the 17-20 age group for males and in the 30-39 age group for females. The total number of crimes and offenses known to the police was 162,498, a decrease of 9,631 or 5.6% against the total for 1948; 60% of them were committed in the four counties of cities, which together included only 37.7% of the total population. Sentences of imprisonment went down by 649. Fourteen cases of murder became known to the police; but of eight persons proceeded against, seven were acquitted and one was found insane and unfit for trial. The percentage of crimes and offenses cleared up was 72.4, as against 68.9 in 1948.

**Europe.**—In France the total number of cases dealt with declined from 720,461 in 1948 to 670,962 in 1949, but the percentage of arrests increased from 47 to 58. Crimes against life went up from 9,138 to 14,969, sexual offenses from 6,557 to 8,094; but thefts remained stationary, and offenses against police regulations of an economic character decreased from 18,919 to 11,585.

In Austria the total number of cases brought to the notice of the police declined from 301,103 in 1948 to 221,097 in 1949. The decline was particularly noticeable for murder and manslaughter (155 as against 227) and for crimes against property (53,485 as against 82,619), whereas sexual offenses increased (from 2,060 to 2,691).

In Italy too there was a decline in the number of cases brought to the notice of the police (1,281,408 in 1949 as against 1,357,193 in 1948) for all categories of crime except sexual offenses, which increased from 6,760 to 7,377.

In Switzerland the figures available for the whole country referred only to the number of persons found guilty. There was a slight decline in the total from 18,672 in 1948 to 18,296 in 1949 for practically all categories except sexual offenses, which increased from 1,772 to 1,818. (See also JUVENILE DELINQUENCY; POLICE; PRISONS.) (H. MM.)

**Crude Oil:** see PETROLEUM.

**Cuba.** The republic of Cuba occupies all of the island which lies between 20° and 25° N. lat. and 74° and 85° W. long. Area: 44,217 sq. mi., including Isle of Pines and smaller islands. The population (est. 1950) was about 5,400,000, approximately half of European and half wholly or partly of non-European origin. Greater Havana had a population in excess of 800,000 (1949); other important cities (1946), Santiago de Cuba, 152,000; Camagüey, 87,000; Pinar del Río, 64,000; Matanzas, 55,000; Santa Clara, 54,000; Cienfuegos, 53,000. Cuba took no census in 1950, but expected to do so in 1951. President during 1950: Carlos Prío Socarrás.

**History.**—In domestic affairs, Cuba went through 1950 on a basis of expanding activity, full employment and rising de-

mand for its principal product, sugar. By the end of the sugar-producing season (June 14) the output attained 6,126,000 tons, the third largest crop on record. The outlook for a larger crop in 1951 was considered reasonable. The public leaders, as well as contract farmers, sugar refiners and labour leaders seemed all to agree in 1950 as to the need of a new agreement, embracing the regulation of production and marketing as well as of price movement.

The projected foreign loan of 200,000,000 pesos (the peso is generally on a parity with the U.S. dollar), proposed in 1949, encountered much opposition, and the constitutionality of the legislation was challenged in the supreme court. Negotiations with the International Bank for Reconstruction and Development (*q.v.*) were carried on during the year. Meanwhile, a public works program was launched under an internal loan of \$45,000,000, and some road-construction contracts were let in the autumn. Government revenue for the fiscal year ending June 30, 1950, on all accounts, amounted to \$301,000,000. The budget for 1950-51 was not approved until the closing days of the congress, in late December. A number of minor technical changes in tax laws were enacted during the session. The congress enacted a law creating an agricultural and industrial bank, and others reorganizing the structure of the provinces and their government. The only other law of importance was that sent to the president on Dec. 12 granting women equal civil rights with men with respect to marriage and property rights. The right to vote was conferred on women in 1936. Legislation requiring all labels on food containers to be printed in Spanish was given effect during the year, and the date in 1951 after which this must be done was fixed.

The National Bank of Cuba, created in 1949, began formal operation in April as the central bank, and shortly after, as the national clearinghouse for all banks in the republic. In August its first statement disclosed that it had assumed responsibility for about \$37,000,000 of treasury demand notes issued in 1947, in part for the purpose of paying the Cuban share in the capital of the International bank.

Prices of consumer goods continued to rise, and wages and other costs followed. The expansion of the capital and large provincial cities could not take place sufficiently rapidly to provide adequate housing, in spite of great building activity.

Cuban-Dominican tension subsided in 1950. When the Nationalist outbreak occurred in Puerto Rico, some sovietophil members of congress proposed resolutions advocating the independence of Puerto Rico from the United States.

Eighteen countries of the western hemisphere were represented at the first regional conference of the United Nations Educational, Scientific and Cultural organization, which opened at Havana on Dec. 8. (C. ME.)

**Education.**—In the school year 1944-45 there were 498,286 children in attendance at public schools and 72,000 at private schools. There were 21 institutes for advanced education and a normal school and a commercial school in each province. University education was available at the University of Havana.

**Finance.**—The monetary unit is the peso, officially pegged at par with the U.S. dollar. As of Dec. 31, 1949, the national debt was \$105,880,000, of which \$73,912,700 was foreign and \$31,967,300 was domestic. Notes in circulation (including U.S. currency) on March 31, 1950, totalled \$722,000,000; the gold reserve was \$299,000,000. The composite statement of the 15 principal banks on Dec. 31, 1949, showed assets of \$662,518,500; total deposits amounted to \$554,462,128.

**Trade and Communications.**—Exports in the year 1949 amounted to \$578,306,696; imports were \$451,390,279. The chief exports were sugar and molasses (88%) and tobacco and its products (4%). The U.S. supplied 83% of the imports. Leading customers were the U.S. (64%), the United Kingdom (12%) and Germany (5%).

Cuba in 1949 had 3,017 mi. of main-line public railroad and about 660 mi. of sidings and yards. In addition, there was a total of 7,870 mi. of industrial trackage. Roads on Jan. 1, 1949, included 1,720 mi. of paved highways and 600 mi. of improved highways. As of Dec. 31, 1948, there were 40,878 passenger cars, 2,795 motorcycles, 24,634 trucks and 4,118 buses. There were two domestic aviation companies—Compania Cubana de Aviacion and Aerovias "Q," both of which had international routes.

In addition, international service was supplied by Pan American World Airways and several other air lines. The merchant marine had 34 steamers and motorships (100 tons and over) aggregating 36,135 gross tons on June 30, 1949.

On Dec. 31, 1948, there were 93,426 connected telephones and about 100 long- and short-wave broadcasting stations. A television station began operation in Oct. 1950; there were about 1,500 television receivers.

**Agriculture.**—Sugar cane continued to be by far the most important crop. Production in the 1949–50 season amounted to 6,126,000 short tons (1948–49: 5,763,500 tons). Production of blackstrap molasses totalled 265,000,000 gal. Production of other crops in 1949 included leaf tobacco 30,000 short tons; coffee 30,500 tons; henequen fibre 17,500 tons; pineapples 138,500 tons; and rice (milled) 42,500 tons. The livestock census of July 1, 1946, showed 4,136,000 cattle, 1,338,000 pigs, 154,000 sheep and 141,000 goats.

**Manufactures.**—The manufacture of sugar from sugar cane is the principal industry. There were in 1950 approximately 160 sugar mills scattered throughout the island. Industrial production in 1949 included cigars 514,254,000 units; cigarettes 7,808,000,000 units; cement 1,837,000 bbl.; cotton piece goods 27,611,387 yd.; tires 53,050 units; paper 24,000 short tons; beer 96,513,920 litres; leather footwear 5,850,000 pr. The cost-of-living index (food) stood at 236 in Aug. 1950 (July-Dec. 1937=100).

**Mineral Production.**—Refractory chromite was the most important mineral in volume of output; 92,287 long tons were produced in 1949. Other minerals included copper concentrate 53,489 long tons; chemical manganese ore 10,982 tons; and metallurgical manganese ore 50,534 tons.

**Curaçao:** see NETHERLANDS ANTILLES.

**Curling.** The Gordon international medal was returned to the United States in March 1950 when U.S. skips captured 15 of 28 matches from their Canadian rivals in a two-day bonspiel at the Utica (N.Y.) Curling club. The victors tallied a total of 332 points against 299 for the Canadian stars.

Ross Tarlton became the first skip ever to win the Douglas medal three times by pacing his Hamilton (Ontario) Thistles to victory in the 15th annual contest at the St. Andrew's Golf club. The Thistles gained the prize with a 19-7 victory over the Mahopac rink in the final match.

The Utica club numbered among its many victories a triumph in the Royal Caledonian trophy series while a team led by Roy Read won the Gordon Grand National medal and another skipped by Ward Murray captured the Mitchell medal for Utica. The Country club of Brookline, Mass., won the Mohawk trophy bonspiel and St. Andrew's of Hastings-on-Hudson, N.Y., took the Utica cup. (T. V. H.)

**Currency:** see COINAGE; EXCHANGE CONTROL AND EXCHANGE RATES. See also under various countries.

**Cycling.** Bobby Pfarr of Kenosha, Wis., pedalled his way to the senior men's title in the 22nd annual national cycling championships held at New Brunswick, N.J. Pfarr scored 9½ points to edge out Bob Travani of Detroit, Mich., who tallied 9. Harry Backer of San Diego, Calif., took the junior men's crown and Doris Travani rode off with the women's laurels in 1950 for the fourth straight year.

Maurice Verdeun of France won world amateur sprint honours, Sid Patterson of Australia captured the pursuit title and Jack Hoobin of Australia the road-race crown. World professional champions were: Reginald H. Harris of England, sprint; Antonio Bevilacqua of Italy, pursuit; Brik Schotte of Belgium, road; and Raoul LeSueur of France, motor-paced.

Ferdinand Kubler of Switzerland led home a huge field of stars in the classic Tour de France, the blue-ribbon event of European bicycle racing. Win van Est of the Netherlands triumphed in the Bordeaux-to-Paris race of 365 mi.

Ed Troll of Ridgewood, L.I., N.Y., finished first in the 21st annual 100-mi. handicap road race of the German Bicycle Sports club at Old Westbury, L.I., N.Y. His time was 4 hr. 17 min. 15 sec. Barney Vander Valk of Hawthorne, N.J., took the best time award with a record 4 hr. 15 min. 33 sec.

(T. V. H.)

**C.Y.O.:** see SOCIETIES AND ASSOCIATIONS: *Catholic Organizations for Youth.*

**Cyprus.** An island in the eastern Mediterranean, Cyprus is a British colony. It lies south of Turkey and west of Syria and Lebanon. Area: 3,572 sq.mi.; pop. (1946 census): 450,114, (1949 est.): 467,000. Chief towns (pop. 1946): Nicosia (cap., 34,463); Larnaca (14,746); Limassol (22,693); Famagusta (15,912). Languages: Greek 80%, Turkish 18%; English also is spoken by about 10%. Religions: Greek Orthodox 80%, Moslem 18%. Governor in 1950: Sir Andrew Wright.

**History.**—The *enosis* movement for union with Greece filled the political stage during 1950, being supported both by the authorities of the Greek Orthodox Church in the island and by the political Left. The Turkish population of the island were opposed to union with Greece and continued to support the British connection. The attitude of the British government remained that the issue of *enosis* was closed and could not be reopened.

It was announced at the beginning of the year that the malaria-eradication campaign could now be regarded as completely successful. The number of cases of malaria had been reduced from about 18,000 in 1946 to less than 100 in 1949; none of these 100 cases was a new infection. The cost of the campaign was £300,000 or 13s. a head of the population. In March the government contracted for the construction of a new power station at Dhekelia to cost £182,962 as the first instalment of a project to supply electric power to almost the whole island, and in May it was announced that a colonial development grant of £46,000 had been made for a geological and geophysical survey of the colony. In his budget speech in March the governor said that Cyprus had reduced its adverse trade balance from £9,700,000 in 1948 to less than £3,000,000 in 1949. A further reduction of more than £700,000 followed in the first half of 1950. There were 611 co-operative societies with a membership of 98,485. An archaeological expedition, financed by the Ashmolean museum, Oxford university, and Sydney university, Sydney, N.S.W., arrived in August to investigate an Iron Age site near Myrtou.

**Finance and Trade.**—Currency: the Cyprus pound of 180 piastres (£1=£1 sterling=280 cents U.S.). Budget (est. 1950): revenue £4,225,610; expenditure £4,053,062. Foreign trade (1949): imports £11,026,971; exports, incl. re-exports, £8,243,353. Principal exports: cuprous concentrates, iron pyrites, asbestos, wine and agricultural produce. (K. G. B.)

**Cyrenaica:** see LIBYA.

**Czechoslovakia.** A people's republic of central Europe, Czechoslovakia has an area of 49,330 sq.mi. Pop.: (1949 est.) 12,463,000. Languages: Czech and Slovak. Religion: mainly Roman Catholic. Chief towns (pop. 1947 census): Prague (cap., 921,416); Brno (272,760); Moravska Ostrava (181,181); Bratislava (172,664); Plzeň (118,152). President of the republic: Klement Gottwald; prime minister: Antonin Zápotocký.

**History.**—The Slovak Communist party held a congress at the end of May 1950. The main theme of the discussions was the "sin" of nationalism, of which prominent Slovak Communists had proved guilty. These included the premier of the Slovak regional government, Karel Husak, the regional commissioner of justice, Laco Novoměsky, the former chairman of the Slovak party, Karel Šmidke, and the former foreign minister of the republic, Vlado Clementis. According to vice-premier and foreign minister Vilem Široky, Novoměsky had tolerated nationalism in Slovak schools, where "liberalism was making itself felt." Education had been left in the hands of "outspoken enemies of the republic." As for Clementis, his most serious crime was that "in 1939, after the conclusion of the Soviet-German pact, which had such great importance for progressive mankind because it marred the base and treacherous plans of the Anglo-American (*sic*) imperialists.

STATE COURT HEARINGS during a mass trial of Catholic priests in Prague, Czech., during 1950. The Redemptorist monk shown testifying was reported to have pleaded guilty to treason and was sentenced to ten years in prison

he stood up against the Soviet Union, he took up the position of a class enemy." His impious attitude persisted during the Finnish-Soviet war and the "liberation of western Ukraine and western White Russia." At the congress all four heretics appeared and abased themselves. Husak and Novoměsky were accepted as penitents, but the "self-criticism" of Šmidke and Clementis was rejected. The obdurate heretics were handed over to the secular arm, and nothing more was reported on their fate.

Spy trials continued to flourish during 1950. In the first five months of the year there were six, involving accusations of espionage for the United States, Great Britain and the Netherlands. The most important was concluded on May 31. The chief accused, the former member of parliament and prominent figure in the Czech Socialist party, Mrs. Milada Hořáková, was hanged. The authorities paid special attention to the police and army. On May 23 a new ministry of national security was set up, distinct from the ministry of the interior. It was entrusted to the Communist Ladislav Kopřiva. In June an order of the defense minister Alexěj Čepička gave greater powers to the political commissars and urged greater activity by the branches of the Communist party and of the youth organization within the army.

Official spokesmen continued to complain of insufficient efforts by the industrial workers. At a meeting of the Miners' union in Moravská Ostrava on Sept. 8, Premier Antonín Zápotocký stated that before World War II the average hourly output of coal had been 213 kg., and in 1950 was only 175 kg.

Collectivization of agriculture had not gone so far in Czechoslovakia as in other countries of eastern Europe. There were three forms of "unified agricultural co-operative" in the republic. The most widespread was one in which members shared agricultural machinery but farmed their own holdings independently. At the end of Feb. 1950 there were 2,400 of these in the country, with 110,000 members. Preparatory committees existed, to prepare such co-operatives, in a further 1,300 villages. The second type of co-operative provided for joint harvesting, but the crop was distributed according to the acreage held by

each member. The third type was one in which the crop was distributed mainly according to the labour of the members, but some account was also taken of the size of the holdings which members brought with them into the co-operative. Of this last type, which resembled that which was being rapidly developed in Bulgaria and Hungary, there were only 30 in Czechoslovakia in the first months of 1950. The slow rate of collectivization in Czechoslovakia could be explained partly by the comparative prosperity of the peasants, especially in the Czech lands. There was not much land shortage, methods of cultivation were comparatively good and peasants could do well from individual small and medium holdings. There was no destitute rural proletariat. In such conditions peasants were not eager to join collective farms and strongly opposed them. The government did not wish to antagonize the whole peasantry and so was going slowly. Another reason was that, as industry was already well developed and the skilled working class numerous, industrial planning did not require such a large and rapid increase in the unskilled labour force.

In the conflict with the Catholic Church there was no change in policy. The government's efforts to organize a group of collaborationist clergy, to denounce the reactionary aims of the Vatican and the hierarchy, continued. The archbishop of Prague, Josef Beran, remained confined to his palace. On April 18 the government took over monastery buildings throughout the republic, on the grounds of housing shortage, and concentrated all monks in a few selected buildings.

In foreign policy, the Moscow-sponsored *rapprochement* with eastern Germany continued. On June 21 a German delegation led by the Communist leader Walter Ulbricht visited Prague and signed a declaration accepting the present western frontiers of Czechoslovakia as definitely binding on the German people. Among other features of Czechoslovakia's foreign relations may be mentioned the propaganda campaign started in July which accused the United States of dropping Colorado beetles from aircraft over Czechoslovak territory.

(H. S.-W.)

Education.—Schools (1948): elementary 12,019, pupils 1,059,010; higher grade 2,280, pupils 463,295; secondary 292, pupils 70,440; vocational

1,243, pupils 91,160; universities 7, students 31,769; institutions of higher education 10, students 23,127.

**Finance and Banking.**—Budget: (1949) revenue 89,320,000,000 koruny, expenditure 89,278,000,000 koruny; (1950 est.) revenue 131,930,000,000 koruny, expenditure 131,556,000,000 koruny. National debt (Sept. 1949) 116,177,000,000 koruny. Currency circulation (March 1950) 72,000,000,000 koruny. Bank deposits (Jan. 1950) 146,000,000,000 koruny. Monetary unit: koruna, with an official exchange rate of 50.15 koruny to the U.S. dollar.

**Foreign Trade.**—(1949) Imports 39,399,000,000 koruny; exports 40,308,000,000 koruny.

**Transport and Communications.**—Roads (Dec. 1946) 43,969 mi. Licensed motor vehicles (Dec. 1949): cars 161,000; commercial 63,000. Railways (1947) 8,161 mi.; passenger-miles (six months 1949) 5,502,000,000; freight net ton-miles (six months 1949) 4,401,000,000. Air transport (1949): flights 16,833; miles flown 4,884,000; passenger-miles 40,931,000; freight net ton-miles 2,598,000. Telephones (1948) 350,708. Radio receiving set licences (Aug. 1949) 2,229,000.

**Agriculture.**—Main crops (metric tons, 1949): wheat 1,573,000, (1950) 1,590,000; rye 1,339,000, (1950) 1,250,000; barley 1,116,000; oats 1,107,000; maize 231,000; potatoes 6,263,000; sugar, raw value, 627,000; grapes 60,000. Livestock (Jan. 1949): cattle 3,663,000; pigs 3,242,000; sheep 459,000; horses 640,000; chickens 13,737,000. Food production (metric tons, 1949): milk 2,618,000; butter 30,000; cheese 13,000; meat 294,000 of which beef 104,400.

**Industry.**—Persons employed in manufacturing industries (Nov. 1949) 1,477,700. Fuel and power (1949): coal 17,004,000 metric tons; lignite 26,520,000 metric tons; manufactured gas 2,189,000,000 cu.m.; electricity 8,268,000,000 kw.hr. Raw materials (metric tons, 1949): pig iron 1,875,000; steel ingots and castings 2,745,000. Manufactured goods (1949): cotton piece goods 318,000,000 m.; cotton yarn 75,800 metric tons; wool yarn 35,400 metric tons; rayon filament yarn 5,500 metric tons; rayon staple fibre 20,500 metric tons; sheet glass 135,500 metric tons; cement 1,740,000 metric tons. Production of motor vehicles (1948) 25,200.

**Dahomey:** see FRENCH UNION; FRENCH WEST AFRICA.

**Dairy Industry, Bureau of:** see AGRICULTURAL RESEARCH ADMINISTRATION.

**Dairy Products.** Production of milk on farms in the U.S. in 1950 was estimated at slightly more than the 119,136,000,000 lb. produced in 1949, perhaps as much as 120,500,000,000 lb., compared with a record production of 121,504,000,000 lb. in 1945. This provided for a total civilian milk consumption (in all forms) per person of 763 lb., compared with 801 lb. per person as an average for 1935-39 and 760 lb. in 1949. Of the total, 390 lb. were used as fluid milk and cream in 1950, or 15% more than the 340 lb. of 1935-39.

The output of milk per cow again set a new record, 5,310 lb. in 1950, as compared with 5,239 lb. in 1949 and a pre-World War II average of only 4,403 lb. The number of milk cows on farms at the beginning of the year was 24,625,000, compared with 24,416,000 in 1949 and 26,175,000 average for the previous decade. The average value per head dropped to \$177 as of Jan. 1, 1950, from \$193 a year previous.

A slight general decline in the price to the farmer for milk and milk products was in evidence until after the outbreak of the war in Korea. The seasonal low reached in June was \$3.45 per hundredweight, rising to \$4.45 in December, as compared with \$4.21 per hundredweight a year earlier. Cash farm receipts for the sale of milk and dairy products in 1950 were estimated at about \$3,710,000,000, as compared with a record of about \$4,441,000,000 in 1948 and \$3,781,000,000 in 1949. Retail prices averaged about one cent per quart higher at the year's end.

The Agricultural act of 1949 made price support mandatory on milk and butterfat at from 75% to 90% of revised parity. In carrying this out, support prices were set to reflect 79% of parity. The department of agriculture announced that farm prices through March 1951 for butterfat and manufacturing milk would be supported at a national average of approximately \$3.07 per hundredweight for milk and 60 cents per pound for butterfat. Cheese would be purchased at 31 cents per pound and evaporated milk at \$3.95 per case. Dried milk solids also would be purchased. The dairy product-feed price ratios were below average and even less favourable than a year earlier.

Stocks of dairy products rose to record levels. Consumption

in the U.S. of butter remained about the same as in 1949, but the 10.5 lb. used per capita was only 63% as much as pre-World War II. Meanwhile, production of butter in the U.S. in 1950 was estimated at more than 1,600,000,000 lb., compared with nearly 1,700,000,000 lb. in 1949 and 2,170,000,000 lb. annually before World War II. With increased consumption of whole milk, supplies of milk for manufactured dairy products were reduced and a record low amount of cream was forecast for 1951. Much of the butter output was accumulated in storage in carrying out the price support provisions of the Agriculture act. Storage stocks of butter on Nov. 30 were 159,297,000 lb., as compared with 130,452,000 lb. a year previous. Near the end of the year, large withdrawals from storage took place because of a rise in price; fair amounts had been exported, especially to Italy; butter was taken off the list of surplus commodities for sale by the Commodity Credit corporation (CCC).

The wholesale price of butter fluctuated near the government support level of approximately 60 cents per pound until late in the year when inflationary trends carried it up a few cents. Retail prices averaged about 10 cents per pound higher than wholesale prices.

The U.S. production of cheese in 1950 was estimated at 1,190,000,000 lb., almost the same as the 1,193,000,000 lb. in 1949; the average for 1935-39 was 669,000,000 lb. Production per capita was 7.8 lb. in 1950, but consumption was estimated at only 7.1 lb. per capita. Thus stocks accumulated, and late in the year were 246,500,000 lb., compared with 153,000,000 lb. a year earlier. More than 109,000,000 lb. of cheese, valued at nearly \$39,000,000, were included in the inventory holdings of the CCC at the end of Oct. 1950, but late in the year it was removed from the list of surplus commodities available for sale by the CCC.

American cheddar, as in previous years, was the major type produced. Wisconsin continued to hold first place among the states with both standard and specialty types, producing about

CHEMICAL APPARATUS at the National Dairy Research laboratories which were dedicated at Oakdale, L.I., N.Y., June 2, 1950. Shown above are the ion exchange columns used to remove mineral salts and acids from whey

one-half of the total for the U.S. Prices were comparatively stable near the government support price, averaging about 31 cents per pound

The 1950 production of ice cream was estimated preliminarily to have used 6,320,000,000 lb. of milk, or 41.4 lb. per person, as compared with 6,640,000,000 lb. in 1949 and a record in 1946 of 8,196,000,000 lb. of milk. Consumption in 1950 in this form was about 3 lb. less per capita than in 1949.

Production of nonfat dry milk solids in 1950 was a record of 950,000,000 lb., compared with 918,000,000 lb. in 1949 and 243,000,000 lb. average pre-World War II. Domestic requirements were only one-half of production, so about half of the output in 1950 was purchased by the government as a price support measure for manufacturing milk—hence the modest increase in exports of this product, of which the CCC had an inventory of 383,510,481 lb. in October.

Production of dry whole milk declined further in 1950 to 125,000,000 lb., compared with a peak 217,000,000 lb. in 1945. Domestic consumption accounted for less than half the total.

Production of evaporated milk in the U.S. in 1950 was substantially below previous record levels, but at 2,850,000,000 lb. was somewhat larger than the 2,756,000,000 lb. of 1949. Stocks late in the year were nearly 20% lower than in 1949.

U.S. exports of dairy products in 1949-50 dropped sharply as to cheese and condensed and evaporated milk, but increased slightly in dried milk. There was a substantial increase in milk production in other countries, particularly in western Europe where production in 1950, due to good pasture, expanding herds and increased supplies of concentrate feeds, generally surpassed pre-World War II levels.

(J. K. R.)

**Dakar:** see FRENCH WEST AFRICA.

SHASTA DAM in California, under multicoloured floodlights as thousands of spectators watched the water flowing over the spillways for the first time at formal dedication ceremonies June 17, 1950

**Dams.** The construction of dams increased during 1950 as the development of water resources continued to expand in most parts of the world.

In the United States, the Columbia river basin projects were pushed to increase the government-controlled power supply for the northwest power pool. At Hungry Horse dam, the world's fourth largest concrete dam, concrete placing reached a rate of 6,618 cu.yd. in 24 hr. on Sept. 4, 1950. An innovation in its construction was the substitution, for 30% of the cement, of fly ash, a by-product of the burning of pulverized coal. Its use results in a more easily placed concrete mixture which has less heat of hydration and less shrinkage and cracking of the concrete mass.

On the main stem of the Columbia river, 51 mi. below Grand Coulee, the world's largest concrete dam, preliminary construction was under way at Chief Joseph dam. On Nov. 9, 1950, bids were opened for the second stage of construction.

Further downstream, at McNary dam, the difficult task of diverting the Columbia river from its main channel was largely accomplished when more than 2,000 concrete tetrahedrons, weighing 12 tons each, being dumped into the gap, broke the water surface the morning of Nov. 16, 1950. The tremendous volume of water flowing through the 240-ft.-wide, 60-ft.-deep gap, was too swift to be withstood by any available stone. Six weeks were required to fill the gap, during which time the river flow increased from about 100,000 cu.ft. per second to 152,000 cu.ft. per second.

On the Missouri river, nearly three quarters of the U.S. army engineer's joint program with the U.S. bureau of reclamation for the development of the Missouri river basin was under contract, and Garrison and Fort Randall dams, largest projects of the program, were more than 25% complete in 1950.

In Canada, the Ladore dam, at the outlet of Lake Campbell

## Chief Dams Completed or Under Construction During 1950

Name of Dam	River	Place	Type	Maximum Height, Ft.	Crest Length, Ft.	Volume (Cu.yd.)	Purpose*	Built by	Progress†
Alvaro Obregón (Oviachic) . . . .	Yaqui	Sonora, Mexico	Earthfill	187	—	11,143,300	I	Secretaría de Recursos Hidráulicos	U
Bull Shoals . . . . .	White	Arkansas, U.S.	Concrete gravity	283	2,256	2,100,000	F,P	U.S. army engineers	U
Castelo-do-Bode . . . .	Zezere	Portugal	Concrete arch	377	—	523,000	P	—	U
Fort Randall . . . . .	Missouri	South Dakota, U.S.	Earthfill	160	10,000	30,000,000	F,N,P,W	U.S. army engineers	U
Gal Oya . . . . .	Gal Oya	Ceylon	Earthfill	154	4,000	6,000,000	I,P	—	U
Garrison . . . . .	Missouri	North Dakota, U.S.	Earthfill	210	12,000	68,511,000	I,F,N,P	U.S. army engineers	U
Hungry Horse . . . . .	Flathead, S. Fork	Montana, U.S.	Concrete arch gravity	564	2,115	3,331,000	I,F,P	U.S. bureau of reclamation	U
Ladore . . . . .	Lake Campbell	British Columbia, Canada	Concrete gravity	140	342	—	P	British Columbia Power commission	C

St. Mary . . . . .	St. Mary	Alberta, Canada	Earthfill	191	2,536	4,500,000	I	Prairie Farm Rehabilitation administration	U
San Angelo . . . . .	North Concho	Texas, U.S.	Earthfill	128	37,540	18,000,000	F	U.S. army engineers	U

\*F—flood control, I—irrigation, N—navigation, P—power, W—water supply. †C—completed in 1950, U—under construction.

on Vancouver Island, B.C., was dedicated in 1950 by the British Columbia Power commission. It was an element of the John Hart project.

In India, because of lack of funds, construction work was delayed in 1950 on Hirakud dam, India's largest, and on the Damodar valley project. Preliminary work on the Bhakra dam in east Punjab was completed in 1950, but later progress was interrupted.

In Africa, the Edfina dam on the Rosetta branch of the Nile river was under construction in 1950.

In Europe, on the Vajont river, tributary of the Piave river in Italy, Vajont dam, to be the second highest dam in the world (Hoover is the highest), was under construction in 1950. A concrete arch dam, it would be built to a height of 662 ft. Ultimately it was planned to raise the dam to a height of 833 ft. It was one of four dams being built to develop 820,000,000 kw.hr. per year from the Piave river and its tributaries. Pieve di Cadore dam, completed in 1950, formed the principal reservoir in the development, storing 52,000 ac.ft. of water.

On the Zezere river in Portugal, placing of concrete in the Castelo-do-Bode dam continued during 1950 at monthly rates of 40,000 cu.yd., with daily rates as high as 2,100 cu.yd. It would be the first of four dams to develop 905 ft. of fall in 85 mi. of the river to produce 400,000 h.p.

In the Ruhr basin in Germany, work was expected to be completed in 1950 on the Verse dam, a 197-ft.-high, 1,050-ft.-long, 1,770,000-cu.yd. earth dam, to store 25,000 ac.ft. of water. Started in 1929, interrupted in 1936 by money and labour shortages and stopped by war in 1944, the work had resumed in 1948.

The accompanying table lists 15 of the important dams of the world under construction during 1950. (See also AQUEDUCTS; IRRIGATION; TENNESSEE VALLEY AUTHORITY.) (B. O. M.)

**Dance.** The year 1950 was marked by extensive international exchange of ballet companies and individual dance artists. Ballet Theatre, the New York City Ballet, Les Ballets Americains and Martha Graham's company appeared in Europe, while the Sadler's Wells Ballet, Ballets de Paris and the Marquis de Cuevas' Grand Ballet de Monte Carlo danced in America.

**United States.**—The New York City Ballet presented three new works choreographed by George Balanchine: *Pas de deux romantique*, with music by Carl Maria von Weber; *Pas de deux* from *Sylvia*, music by Léo Delibes; and the *Mazurka* from *A Life for the Tsar*, by Michael Glinka. *The Prodigal Son* and *Le Baiser de la fée* were revived, and William Dollar's *The Duel* produced in a new version. Frederick Ashton staged *Illuminations*, with a score by Benjamin Britten and costumes by Cecil Beaton. Jerome Robbins choreographed *The Age of Anxiety*, with music by Leonard Bernstein, and collaborated with Balanchine on *Jones Beach*. Patricia Wilde, Diana Adams, Hugh Laing and Harold Lang joined the company, headed by Maria Tallchief,

Tanaquil le Clerq, Janet Reed, Todd Bolender, Herbert Bliss, Francisco Moncion and Nicholas Magallanes. In October Balanchine made his American debut as a performer, miming the father in *The Prodigal Son* and dancing in the *Mazurka*. During the summer the company appeared for six weeks at Covent Garden Opera house, London, and toured England.

Ballet Theatre celebrated its tenth anniversary, presenting *Nimbus*, choreographed by Antony Tudor with music by Louis Gruenberg; *Caprichos*, choreographed by Herbert Ross with music by Béla Bartók; *Joux*, choreographed by Dollar with music by Claude Debussy; and *Design for Strings*, choreographed by John Taras with music by Peter Tschaikovsky. Renamed the American National Ballet Theatre, the company toured Europe, appearing at the Edinburgh and Venice festivals and in Belgium, England, France, the Netherlands, Italy and Switzerland. Mary Ellen Moylan joined the company, which was headed by Nora Kaye, Igor Youskevitch, John Kriza, Norma Vance and Paul Godkin. Alicia Alonso, Allyn McClerie and James Mitchell appeared as guest artists during the European tour. Ballet Theatre was selected to form a new ballet for the Metropolitan Opera, and appointed Tudor as director, with Nana Gollner as prima ballerina. The Metropolitan revived the Walpurgis Night ballet in *Faust*. The Opera Ballet school was reorganized under Tudor and Margaret Craske. Ballet Theatre's production of *Giselle*, with Kaye and Youskevitch, was televised.

Alexandra Danilova, Frederic Franklin, Leon Danielian and Nina Novak headed the Ballet Russe de Monte Carlo, which toured the United States. Yvette Chauviré appeared as guest artist. Ruthanna Boris resigned; Nathalie Kravosvka returned after a year in Europe. New works were *Prima Ballerina*, choreographed by Tatiana Chamie, music by Charles Lecocq; and *Nocturne*, choreography by Victor Gsovsky, music by Wolfgang Mozart.

The Marquis de Cuevas' Grand Ballet, headed by Rosella Hightower, André Eglevsky, Marjorie Tallchief, George Skibine, Ethery Pagava and Ana Ricarda, made its American debut, presenting several works new to America: *Del Amor y de la muerte*, choreography by Ricarda and music by Enrique Granados Campina; *A Tragedy in Verona*, Skibine's first choreographic work, to music by Tschaikovsky; *Salome*, choreography by Hightower, music by Richard Strauss; *Persephone*, arranged by Taras, the company's ballet master, to music by Robert Schumann; and *Les Biches*, choreography by Bronislava Nijinska and music by Francis Poulenc.

Sadler's Wells Ballet danced for three weeks at the Metropolitan Opera house in New York city and made its first transcontinental tour, breaking all box-office records for ballet. New to America were its productions of *Giselle*, *Dante Sonata* and *Don Quixote*. Margot Fonteyn was prima ballerina, with Moira Shearer, Beryl Grey, Violetta Elvin, Pamela May, Michael Somes and Alexis Rassine in prominent roles.

JOSÉ LIMON AND LETITIA IDE in *The Exiles*, a ballet composed by Limon, which was first performed at the American Dance festival held at New London, Conn., during the summer of 1950

Roland Petit's Ballets de Paris appeared in New York and California, presenting American premières of Petit's *Les Forains*, *Les Chaises musicales* and *La Croqueuse de diamants*. Renée Jeanmaire, Colette Marchand and Gordon Hamilton headed the company.

The Jacob's Pillow Dance festival, directed by Ted Shawn, presented Ruth St. Denis, Patricia Bowman, Anna Istomina, Iva Kitchell, Myra Kinch, La Meri, Lillian Moore, Pearl Primus, José Limon, Paul Petroff and others, as well as works choreographed by Aubrey Hitchens, David Tihmar, Herbert Ross and Shawn.

The third American Dance festival, at Connecticut college, New London, presented new works by Limon, Jane Dudley, Sophie Maslow and William Bales. Dancers who appeared included Nina Fonaroff, Pauline Koner, Katherine Litz and Merce Cunningham.

The San Francisco Ballet, directed by William Christensen, gave *Nothing Doing Bar*, music by Darius Milhaud; and *Prelude*, music by George Frederick Handel. San Francisco Ballet guild, Pacific Dance theatre and the Lester Horton Dance theatre were active in California. *Ballet Ballads* was revived in Hollywood.

Chicago saw performances by the Stone-Camryn Ballet, directed by Bentley Stone and Walter Camryn, the Chicago Ballet guild, Chicago Dance theatre and Berenice Holmes' Palette Ballet. Ruth Page staged the ballets in *Aida* during the visit of the New York City Opera company.

There was increasing dance activity in other centres. The National Ballet was founded by Marion Venable in Washington, D.C. Thelma Biracree produced the ballets for the annual Festival of American Music in Rochester, N.Y. Marion Miller founded the Houston Ballet. André van Damme choreographed Maurice Ravel's *Beauty and the Beast* in Charleston, W.Va.

Ted Shawn, Ruth Page, Bentley Stone, Iva Kitchell, Sujata and Asoka, Talley Beatty, Marina Svetlova, Mark Ryder and Emily Frankel, Mata and Hari, and the Viennese Ballet ensemble made extensive tours, while Katherine Dunham, Ruth St. Denis, Uday Shankar, Rosario and Antonio, Valerie Bettis and Carmelita Maracci appeared in New York city.

**England.**—Sadler's Wells Ballet presented *Don Quixote*, choreographed by Ninette de Valois, the company's director, to music by Roberto Gerhard; *Ballabile*, choreography by Petit, music by Emmanuel Chabrier; and *Ballet Imperial*, choreography by Balanchine, music by Tschaikovsky. With a small company, Margot Fonteyn and Robert Helpmann toured England. At a gala performance celebrating the 21st anniversary of Sadler's Wells Ballet, De Valois reappeared as a dancer.

Sadler's Wells Theatre Ballet produced *El Destino*, *Summer Interlude* and Balanchine's *Trumpet Concerto*. Svetlana Beriosova joined the company.

The Ballet Rambert toured England and Germany, and had seasons in Paris and London. David Paltenghi choreographed *St. Agnes' Eve*, to music by César Franck, and *Prismatic Variations*, with music by Beethoven. *Winter Night* was produced by Walter Gore.

Anton Dolin and Alicia Markova formed the Festival Ballet, which opened in London Oct. 24. The repertoire included *Giselle*, *Petrouchka*, *Capriccioso* and Ricarda's new *Fiesta*. Léonide Massine and Yvette Chauviré appeared as guest artists.

Massine revived *Gaité parisienne* for the International Ballet, headed by Mona Inglesby, which toured England and Switzerland. The British Broadcasting company formed its own ballet, to present *Ballet for Beginners* and other dance programs on television.

The Marquis de Cuevas' Grand Ballet, Mariemma, and Rosario and Antonio appeared at the Edinburgh festival, the New York City Ballet danced at Covent Garden and the American National Ballet theatre appeared at both Edinburgh and London. Angna Enters, Juana, Cilli Wang, Angelo Andes, Consuelo Carmona, Ram Gopal and Raden Mas Utomo appeared in London concerts.

**France.**—Tamara Toumanova was engaged as guest ballerina at the Paris Opera, and appeared in *Phèdre*, by Jean Cocteau, with choreography by Serge Lifar and music by Georges Auric. Lifar also produced *Septuor*, music by Jean Lutèce, and *L'Inconnue*, music by André Jolivet. Albert Aveline revived *La Grande Jatte*, *Les Éléments* and *Fêtes d'Hebé*. Liane Dayde was promoted to *première danseuse* and Alexander Kalioujny to *premier danseur*. Nina Vyroubova made her debut in *Giselle*.

Massine produced Ravel's *La Valse* and revived *Le Beau Danube* and *La Boutique fantasque* for the Opéra Comique, while Jean-Jacques Etcheverry choreographed a ballet to Tschaikovsky's *First Piano Concerto*.

Roland Petit produced *Les Chaises musicales*, music by Auric, and *La Croqueuse de diamants*, music by Jean-Michel Damase, for his Ballets de Paris. In September Jeanmaire returned after an absence resulting from a leg injury, during which time Shearer and Marchand replaced her in *Carmen*.

In May Les Ballets Americains, headed by Ruth Page, Bentley Stone and José Limon, presented *Frankie and Johnny*, *Billy Sunday*, *The Bells*, *The Moor's Pavane* and *La Malinche* at the Théâtre des Champs Élysées, Paris.

For the April coronation festivities of Prince Rainier III of Monaco, Massine produced *Suite de danses*, music by Jean Philippe Rameau, and *Concertino*, music by Jean Francaix. The Marquis de Cuevas' Grand Ballet presented *Persephone* and *Divertissement pour un couronnement* for the celebration. With Janine Charrat as guest artist, this company toured Germany and France, and, with Jean Babilée and Nathalie Philippart, danced at the Venice festival. After a New York season, the company was completely reorganized, returning to France in late December.

**Austria.**—For the Vienna State Opera Ballet, Erika Hanka choreographed Theo Berger's *Homeric Ballad* and Igor Stravinsky's *The Firebird*. The Opera Ballet danced *Coppélia* and *Austrian Peasant Wedding* at the Bregenz festival. At the Austrian Dance competition, prizes were awarded to Christel Florian, Hertha Bade, Inge Fiala, Grete Bauer and Richard Novotny.

**Canada.**—At the third Canadian Dance festival, held in Montreal in November, outstanding works were given by Kay Armstrong of Vancouver, Elizabeth Leese of Montreal, Arnold Spohr of Winnipeg, Irene Apine and Juris Gotshalks of Halifax. Ruthanna Boris presented her *Sonata*, with music by Johannes Brahms, in Montreal.

**Germany.**—For the Berlin Staedtische Opera, Jens Keith choreographed *Chiarina*, music by Boris Blacher, and *Wundertheater*, music by Hans-Werner Henze. Lee Spiess choreographed *Don Quixote* for the Staatsoper. Victor Gzovsky was appointed ballet master, and Irene Skorik prima ballerina, of the Munich Opera. In Hamburg, Dore Hoyer choreographed Ravel's *Bolero* and Stravinsky's *Suite in D Minor* for the Opera, while *Vita Nostra*, by Lola Rogge, was presented at the Deutsches Schauspielhaus.

**Italy.**—For the May festival in Florence, Aurel Milloss choreographed Sergei Prokofiev's *Chout* and the operas *Olympia*, by Gasparo Spontini, and *Armide*, by Jean-Baptiste Lully, with Maria Dalba, Genevieve Lespagnol, Vladimir Skouratoff and Boris Trailine as leading dancers. The Paris Opera Ballet, with Toumanova, Vyroubova and Lifar, appeared.

*Les Sylphides* and *The Sleeping Beauty* were presented by Margarete Wallman at La Scala, Milan, where Fonteyn, May, Chauviré, Helpmann and Skouratoff appeared as guest artists. Boris Romanoff was engaged as choreographer and Vera Volkova as head of the school at La Scala.

Euripides' *Le Baccanti* and Aeschylus' *I Persiani* were presented in the Greek theatre at Syracuse, with choreography by Chladek.

For the Venice Festival of Contemporary Music, Milloss choreographed *The Wooden Prince*, music by Bartók, and *Ballad without Music*. Leading dancers were Skorik, Skouratoff and Yurek Shabelevsky. American National Ballet theatre and Marquis de Cuevas' Grand Ballet also appeared.

**Netherlands.**—The Ballet of the Low Countries, headed by Max Dooyes; Ballet Recital, directed by Sonia Gaskell; and Han Rijnbeck's group were active. Rosario and Antonio and the Marquis de Cuevas' Grand Ballet danced at the Scheveningen festival.

**Scandinavia.**—Fonteyn and Helpmann appeared in Oslo, Nor., at a benefit for the New Norwegian Ballet, which presented *Spanish Fantasy* and *Mot Ballade*. Later this company danced in England.

Tudor completed his guest contract at the Stockholm Opera, where he presented *Gala Performance*, *Lilac Garden*, *Giselle* and a new ballet, *Arabesque*. The Stadtsteatern in Malmö presented *The Princess and the Swineherd*, choreography by Gustaf Kruuse,

music by Kurt Atterberg.

Margot Lander retired after 17 years as prima ballerina of the Royal Opera, Copenhagen, Den., and was presented with the king's gold medal. During a summer season, the Royal Opera Ballet, headed by Kirsten Ralov, Margarethe Schanne and Mona Vangsaa, presented 21 ballets choreographed by Augusteournonville, Harald Lander, Borge Ralov, Nini Theilade and Birger Bartholin. Nina Stroganova and Vladimir Dokoudovsky appeared as guest artists.

**South America.**—Ballet Alicia Alonso obtained a subsidy from the government of Cuba, and produced *Ensayos sinfonicos*, Alonso's first choreographic work, to music of Brahms. Alicia Markova, Anton Dolin and Mia Slavenska toured the Caribbean. José Limon and his company danced in Mexico City.

The Teatro Colon, Buenos Aires, Arg., presented Werner Egk's *Joan de Zarissa* and Arnoldo d'Esposito's *Ajedrez*, both choreographed by Tatiana Gzovsky. Tatiana Leskova was the new ballet mistress at the Teatro Municipal, Rio de Janeiro, Braz. Katherine Dunham, Pilar Lopez and the Paris Opera Ballet, headed by Toumanova, Vyroubova, Lifar and Kalioujny, appeared in South America.

**U.S.S.R.**—A conference of 14 choreographic schools was held in Moscow, with Agrippina Vaganova presiding. Peter Andrianov, 19, made his debut in *La Fille mal gardée* and was hailed as a future Nijinsky. At Leningrad, the new ballet, *Youth*, choreographed by Boris Fenster, received the Stalin prize. At Stalingrad *Swan Lake* was restaged by Konstantin Sergeyev, after Marius Petipa and Lev Ivanov. (LN. M.)

**Ballroom Dancing.**—The year 1950 brought a widespread return of the Charleston, a dance first seen in 1925. Swift impetus was added to the revival through contests held in Hollywood, Calif. Newsreel and candid camera pictures were taken of film stars dancing the Charleston, and further interest in the dance was awakened by the Broadway musical revue *Gentlemen Prefer Blondes*. Many big-name bands made new Charleston recordings.

The mambo, an advanced and syncopated form of rumba, increased in popularity, with all new rumba tunes of 1950 written in mambo tempo. Samba, the easiest of the Latin-type dances, continued in popularity. Toward the end of 1950, interest in the tango was evidenced. Jitterbug or "swing" dancing continued to quiet down, adopting less frenzied patterns, and there were few new popular swing tempo tunes.

Square dancing found many new enthusiasts. In the early fall the world's largest square dance jamboree took place in Santa Monica, Calif., where 8,000 dancers were guided by 36 "callers."

FILMS OF 1950.—*The Desperate Heart* (D. D. Livingston); *Fable of the Peacock*, *People Dance*, *The Moor's Pavane* (Brandon Films, Inc.); *Mask* (A. F. Films, Inc.); *Steps of the Ballet* (Encyclopædia Britannica Films Inc.). (A. Mu.)

**DDT:** see AGRICULTURAL RESEARCH ADMINISTRATION.

**Deafness.** In 1950 there were approximately 10,000,000 people in the United States who were hard-of-hearing to some extent in one or both ears, but only about 4,000,000 were believed to have serious handicaps. Approximately 100,000 people in the United States were totally deaf.

In Jan. 1950, there were 20,252 deaf children being educated in 73 public residential schools, 139 public day schools and 37 denominational and private schools for the deaf in the United States. Approximately 1,000,000 children in public schools were hard-of-hearing but not sufficiently handicapped to require hearing aids or lip reading. Mothers of deaf children were advised to seek medical and professional advice about the early training so

that the child's native ability might not necessarily be retarded. Lip reading was preferred to sign language.

Otologists were becoming more familiar with the fenestration operation for the rehabilitation of the hard-of-hearing. This operation, no matter how well done, did not re-establish normal hearing. Reliable information indicated that approximately 12,000 fenestration operations had been performed in the United States. The operations that gave practicable, serviceable hearing without a hearing aid were estimated to be 60%. Another 10% were so much improved that hearing aids were found of value in rehabilitation.

Most of the hard-of-hearing persons continued to be rehabilitated by means of a hearing aid. It was estimated that about 3,000,000 required hearing aids or the use of lip reading or both, and that less than 1,000,000 used hearing aids. A hearing loss of 30 to 35 decibels (sound level units) in both ears within speech frequency range was declared as a handicapping loss. Hard-of-hearing persons were advised to have their ears examined by a physician before purchasing a hearing aid. A comfortable ear mould fitted before attempting to select a hearing aid was essential to good performance. Several clinics were established in medical schools for appraising the hearing of deafened persons and to provide an opportunity to try out a large number of acceptable hearing aids.

Twenty-one hearing-aid bureaus were a part of the service of at least 119 local branches of the American Hearing society in as many cities. Seventy-two of these branches gave instruction in lip reading. Practically all of the hearing aids available in 1950 were of the single unit type in which all of the components were packed in a single case with the exception of the earphone and its connecting wire. Hearing aids weighed approximately four to five ounces complete and cost from \$75 to \$225. In general, the difference in price was attributed largely to the amount of free service rendered to the hard-of-hearing after the purchase of a hearing aid. The upkeep for maintaining a battery was approximately ten cents a day on an eight-hour operational basis. A list of accepted hearing aids and requirements for acceptance is obtainable from the Council on Physical Medicine and Rehabilitation of the American Medical association, 535 N. Dearborn St., Chicago 10, Ill. (See also EAR, NOSE AND THROAT, DISEASES OF.) (H. A. C.)

**Dean, Gordon Evans** (1905– ), chairman of the U.S. Atomic Energy commission, was born on Dec. 28 in Seattle, Wash., and studied at the University of Redlands, Redlands, Calif.; the University of Southern California at Los Angeles; and Duke university, Durham, N.C., where he also served as instructor and assistant to the dean of the law school. In 1934 he joined the staff of the criminal division of the department of justice, and the following year was admitted to practice before the U.S. supreme court. In 1936 he became chief of the appellate section of the department's criminal division, and from 1937 to 1940 was special executive assistant to the attorney general in charge of public relations. From 1943 to 1945 he served on active duty in the U.S. naval reserve, and in May 1945 was appointed assistant to Robert H. Jackson, chief U.S. prosecutor at the war crimes trials at Nuremberg, Ger. On his return to the U.S. in 1946 he became professor of criminal law at the University of Southern California. On May 9, 1949, he was appointed to the U.S. Atomic Energy commission. In early 1950 he issued a statement in which he anticipated a relaxing of government monopoly of atomic energy, once weaponmaking was at a specified rate, so that science and industry might put the new power source to peacetime uses. His reappointment to the commission was confirmed in June 1950, and in July he was appointed its permanent chairman by Pres. Harry S. Truman.

**Deaths** (of prominent persons in 1950): see OBITUARIES.

**Death Statistics.** Mortality in the United States reached a record low point in 1950; for the first nine months of that year the death rate was 9.6 per 1,000 population, or 1% lower than the corresponding rate for the same period of 1949. A month-by-month comparison for the two years showed higher rates for 1950 in March and April when there was an outbreak of influenza. During the entire year 1949, there were 1,446,000 deaths, with a death rate of 9.7 per 1,000 population. Provisional indications for Canada pointed to a slightly higher death rate for 1950 than for 1949, when that country recorded 121,115 deaths and a rate of 9.2 per 1,000 population. In England and Wales, however, provisional urban data for the first ten months of 1950 showed 2% fewer deaths than in the like period of 1949. In all of England and Wales, 510,819 deaths were recorded in 1949, and the death rate was 11.7 per 1,000. In the same year, Australia had a death rate of 9.5 per 1,000, and New Zealand (excluding Maoris) 9.1 per 1,000. It should be noted that valid international comparisons of death rates cannot be made without taking account of the differences in the age distribution of their populations. A nation having a large proportion of its people at the prime ages of life, when mortality is low, will tend to have a lower death rate than another nation with a large proportion of aged people.

A better comparison of the health status of nations is provided by the figures for average length of life. In 1947, the latest year of comparison, the average length of life for white males in the United States was 65.2 years; this was 1.1 years less than the corresponding figure for Australia, and 2.6 years less than for New Zealand, but 0.6 years greater than for England and Wales. In the case of white females, the average length of life for the United States in 1947 was 70.5 years; it was only 0.4 years greater in Australia, 1.1 years greater in New Zealand, and 1.2 years less in England and Wales.

A noteworthy point is that the recent differences in longevity between the United States and New Zealand, the country with the best record, were much smaller than at the beginning of the century. In 1901–10, white males in the United States, with an average lifetime of 49.3 years, were 9.3 years below the record for New Zealand; for white females, the corresponding figures were 52.5 years and 8.7 years.

The latest figures for average lifetime for the United States, relating to 1948, were 67.2 years for total persons, 65.5 years for white males, 71.0 years for white females, 58.1 years for nonwhite males, and 62.5 years for nonwhite females. Compared with the like figures for 1939–41, not quite a decade earlier, the recent situation showed gains of 3.6 years for total persons, 2.7 years for white males, 3.7 years for white females, 5.8 years for nonwhite males, and 6.9 years for nonwhite females.

Provisional data for the United States comparing the first eight months of 1950 with the like period of 1949 showed reductions in death rates for tuberculosis, syphilis, acute poliomyelitis, measles, diphtheria, appendicitis, hernia and intestinal obstruction, gastritis, cirrhosis of the liver, nephritis, complications of pregnancy, accidents other than motor vehicle and homicide. On the other hand, rises were shown for whooping cough, cancer, diabetes mellitus, the category comprising the major cardiovascular-renal diseases, pneumonia, influenza, ulcer of the stomach, motor vehicle accidents and suicide. For the same period of comparison, mortality in the first year of life was lower in 1950 than in 1949. It was also lower for ages 1 to 24 years and again for ages 45 to 74 years; however, for ages 25 to 44 years, there was no change in the death rates.

In 1949, several changes were introduced that affected the comparability of mortality from specific causes of death over the

years. First, a new form of death certificate was adopted by most states in which the physician was asked to specify the morbid condition underlying the train of events that terminated with death. Second, the single condition accepted as the cause of death for purposes of statistical classification was the underlying condition stated by the physician; prior to 1949, the selection of the primary condition, when more than one was stated on the death certificate, was made in a statistical office according to a designated procedure. Third, the international list used for classifying the causes of death reported on death certificates was radically changed at an international conference held in Paris in 1948. To measure the effect of the changes in classification procedure, the deaths for 1949 were classified by both the old and the new methods. It was found that the deaths ascribed to tuberculosis by the new procedure decreased by 4%, syphilis by 27%, acute poliomyelitis by 2%, measles by 6%, diabetes mellitus by 42%, pneumonia by 25%, bronchitis by 5%, ulcer of stomach or duodenum by 14%; appendicitis by 10%, gastritis by 2%, cirrhosis of the liver by 18% and conditions arising out of pregnancy or childbirth by 10%. By the same change in procedure, deaths ascribed to diphtheria increased by 2%, rheumatic fever by 164%, diseases of the cardiovascular-renal system by 5%, influenza by 21%, hernia and intestinal obstruction by 7%, diseases of early infancy by 6%, and homicide by 2%. By both procedures, practically the same numbers were ascribed to whooping cough, malignant neoplasms, suicide and motor vehicle accidents. However, deaths classed as accidents of other forms decreased by 7% by the new procedure.

According to a report from the defense department dated Nov. 30, 1950; there were 5,303 U.S. personnel who died in action in Korea; the subsequent campaign raised this number significantly. (See also ACCIDENT PREVENTION; CENSUS DATA, U.S.; DISASTERS; INFANT MORTALITY; SUICIDE STATISTICS.)

**Debt, National.** The national debt of the United States at the end of the fiscal year 1951 was estimated by Pres. Harry S. Truman in his budget message of Jan. 15, 1951, at approximately \$260,000,000,000. This figure represented an increase of less than \$3,000,000,000 from the debt total at the end of the preceding fiscal year. (See Table I.) In con-

a year later that the actual expenditures would amount to more than \$47,000,000,000. A simultaneous increase in taxes, however, had held the increase in national debt to smaller proportions. Nonetheless, it is significant that after a few years of debt reduction following the peak total of \$279,214,000,000 reached at the end of Feb. 1946, the national debt was again on a rising trend in the fiscal years 1950 and 1951.

The postwar debt-retirement program involved a gross reduction in marketable interest-bearing securities of \$44,686,000,000 from March 1946 to the end of 1949. As may be seen in Table II, this trend was reversed in 1950 when the marketable debt rose by \$2,673,000,000.

Table III furnishes data on the sources of funds for the reduction in the marketable interest-bearing public debt. The funds used to retire aggregate maturities of \$23,197,000,000 during the last ten months of 1946 were obtained chiefly from the general fund cash balance accumulated by the Victory Loan drive.

In 1947, 1948 and the first half of 1949 funds for reducing the marketable public debt were derived mainly from the growth in nonmarketable issues and from budgetary surpluses. In the second half of 1949 and 1950, when the decrease in marketable securities was nominal, the further substantial increase in nonmarketable obligations was offset by a budget deficit. As a result of the substantial reduction in marketable issues, together with the increase in nonmarketable issues, the portion of the total public debt constituted by marketable interest-bearing obligations declined from 72% in March 1946 to 59% at the end of 1950.

The significance of federal debt management in 1950 can best be viewed against the background of previous management operations. The maintenance of order and stability in the government bond market—a policy initiated in the pre-World War II period—was a primary objective of the debt management program in the war and postwar periods. In line with this objective, the prewar structure of interest rates was maintained with only minor variation during the war, permitting the authorities to finance cheaply the huge requirements of war finance.

In the postwar period the stabilization of the government bond market, a joint treasury-federal reserve function, required different policies to meet changing conditions. Beginning in the spring of 1947, for example, several steps were taken to control

Source: Data from 1915 to 1950 are from U.S. Department of the Treasury, daily treasury statement (revised); 1951 is estimate from President Truman's Jan. 1951 budget message.

nection with the budget for the fiscal year 1952, the president estimated that because of the heavy requirements for the rearmament program that was initiated after the outbreak of the Korean war, the national debt would rise by more than \$16,000,000,000 unless taxes were further increased. He proposed that new tax legislation be initiated which would result at least in a balanced budget for the fiscal year 1952.

In the fiscal year 1951 the budgetary expenditures of the government had to be substantially revised after the beginning of the Korean conflict. Whereas President Truman had originally recommended expenditures of \$42,439,000,000, it was expected

an incipient boom in the government bond market. But in 1948, when a downward pressure on government bond prices developed, the federal reserve system shifted its policy. It supported the market through substantial purchases of government bonds from investment institutions and other nonbank holders seeking to acquire funds for lending. The prices of the longest-term issues were stabilized at slightly above par.

While pursuing the broad policy of stabilizing the market for government securities, treasury and federal reserve authorities adopted numerous measures designed to combat postwar inflation. Among them may be noted: (1) the substantial reduction effected in bank ownership of federal securities; (2) active promotion of the sale of savings bonds; (3) permitting interest rates to rise on short-term government securities from mid-1947 until the fall of 1948; and (4) raising by approximately \$3,000,000,000 in 1948 the amount of reserves required to be held by member banks, to prevent the additional reserves created by federal reserve support purchases from becoming the basis for multiple credit expansion.

With the abatement of inflationary pressures and the moderate slackening of business activity, the federal reserve board in May, June and Aug. 1949 reduced reserve requirements of member banks in order to make credit more freely available.

The strong bank demand that stemmed from the series of reductions in reserve requirements resulted in sharp increases in the prices of government securities. To maintain orderly conditions in the money markets, the federal reserve sold short-term securities in considerable volume; but it discontinued the practice of freely selling government bonds. This compromise policy moderated the decline in yields on short-term government securities but permitted market forces to depress sharply the yields on medium and long-term government securities, thereby encouraging investors to seek municipal and corporate securities and mortgage loans as outlets for their funds.

It was thus evident that the policy established in mid-1949 marked a new development in public debt management. Removing the maintenance of a fixed pattern of rates on government securities from the position of primary concern gave the monetary authorities more flexibility in adapting to changing economic conditions.

In the period after the outbreak of war in Korea steps were taken to restrict credit expansion without disturbing the stability of the government bond market. As there was a prospect of further rise in government debt, the drive to shift debt-holding to nonbank investors was intensified. There was a minor increase in the interest rate on short-term government securities. In order to restrain the expansion of bank credit to private business, the discount rate of the Federal Reserve Bank of New York was raised, the federal reserve system sold government securities in the open market, and at the end of the year an increase in reserve requirements to take effect shortly was announced.

Debt operations in the postwar period effected a striking redistribution in public debt ownership. (See Table IV.) The public

debt and guaranteed securities held by banks declined from 42% of the total in Feb. 1946 to 33% in June 1949. The decline was arrested thereafter as a result of commercial bank investments of excess reserves.

The average interest rate on the public debt was 2.200% in Dec. 1950, as compared with 2.215% in Dec. 1948. In President Truman's Jan. 1951 budget message it was estimated that total payment of interest on the public debt would amount to \$5,800,000,000 in fiscal 1952. This compared with the total of \$5,625,000,000 in fiscal 1951. The president cited three factors accounting for this increase: (1) the expansion of special issues to

government trust funds at rates of interest higher than the average on the debt as a whole; (2) the increase in the size of the total debt; (3) the large accruals of interest on World War II savings bonds as they get closer to maturity.

**U.S. State and Local Government Debt.**—From June 30, 1949, to June 30, 1950, the aggregate debt of state and local governments in the U.S. increased almost \$3,000,000,000—from \$20,-875,000,000 to \$23,647,000,000. (See Table V.) The largest increase was in the debts of states, though cities and school districts also rose appreciably.

The rise in state and local government debt from 1946 to 1950 by 50% was in contrast to the widespread reductions effected during the war years. Rising revenues and restricted expenditures allowed state and local governments to reduce their total gross debt from \$20,246,000,000 in 1940 to \$15,922,000,000 in 1946.

**Other Countries.**—In Table VI are presented data on the national debts of many countries of the world. Insofar as available information permitted, the data are shown for 1946 or 1947 and for 1939, affording a comparison of national debts before and after World War II.

In nearly all the countries for which data are provided in the table, national indebtedness was substantially higher in the post-war period than in 1939.

During World War II, debt increases were particularly large in the belligerent countries, but sizable increases occurred in numerous non-belligerent countries, which were required to make unusual expenditures. (See also BUDGET, NATIONAL.)

(M. Gt.)

**Defense, U.S. Department of:** see GOVERNMENT DEPARTMENTS AND BUREAUS.

**De Gasperi, Alcide:** see GASPARI, ALCIDE DE.

**Delaware.** Delaware, on the middle Atlantic seaboard, one of the original 13 states of the United States, is called the "First state," having been the first to ratify the federal constitution, Dec. 7, 1787. The "Diamond state" is also a popular name. Area 2,057 sq.mi. (land 1,978; inland water 79). Population (1950 U.S. census) 318,085 compared with (1940) 266,505. Of the latter, native white numbered 215,695; foreign-born 14,913; Negro 35,876.

Dover (pop. 1950 census preliminary figures) 6,322 is the capital; Wilmington (1950 preliminary figures) 109,907 is the only large city in the state.

**History.**—The commission on reorganization of state government adopted in 1950 a report prepared by a firm of consultants for the consolidation of 92 existing boards, commissions and agencies of the executive branch into 19 departments and agencies.

The U.S. air force established a complete reserve training centre at the New Castle county airport. Negro undergraduates were admitted to the University of Delaware upon decision of the court of chancery. A state museum of arts and history was opened at Dover.

A cash bonus was paid by the state to 31,740 veterans of World War II or their beneficiaries.

The chief state officers in 1950 were: governor, Elbert N. Carvel; lieutenant governor, Alexis I. du Pont Bayard; secretary of state, Harris B. McDowell, Jr.; tax commissioner, Howard S. Abbott; bank commissioner, John C. Darby; chief justice, Charles S. Richards; director, legislative reference bureau, Robert W. Tunnell. Newly elected in November were: attorney general, H. Albert Young; insurance commissioner, William R. Murphy; state treasurer, Ralph W. Emerson; state auditor, George Daniel Enterline, Sr. Newly appointed were: chancellor, Daniel O. Wolcott; adjutant general, Brig. Gen. Joseph J. Scannell.

**Education.**—The council for Delaware education conducted a study and prepared legislative proposals to permit reorganization of the state's many small school districts into larger efficient units; also for increasing the required attendance in the school year from 160 to 180 days and the compulsory attendance age from 14 to 16 years. During the fiscal year ending June 30, 1950, the state board of vocational education placed 423 disabled persons in earning jobs. The commissioner of education in 1950 was George R. Miller, Jr.

The cost of operation of the state schools for the fiscal year was \$10,-131,119. The expenditure per pupil in attendance increased from \$212.48 to \$243.42. The 142 elementary schools had a net enrolment of 28,423 as of June 1950. The elementary teaching staff numbered 952. The 47 secondary schools had 16,923 pupils and a teaching staff of 879.

**Social Insurance and Assistance, Public Welfare and Related Programs.**—Servicemen's readjustment allowances paid in 1950 totalled \$41,106; state unemployment compensation, \$1,821,268; the number of active claims in the last week of Dec. 1950 was 2,525. The cost of outside relief for the calendar year was \$534,327 for an average of 1,246 cases per month. The cost was shared half and half by the state and the county in which the relief was given. In Dec. 1950, 1,614 persons were receiving old-age pensions, compared with 1,617 in Dec. 1949.

During the fiscal year ending June 30, 1950, 843 children were cared for in their own or foster homes at a cost of \$249,083; the number of dependent children aided was 2,468 at a cost of \$601,111. The state appropriation for public welfare was \$3,165,740 (not including additional grants to semipublic institutions). Included were Ferris school (industrial for boys) \$192,500; Kruse school (correctional for Negro girls) \$58,200. The New Castle county workhouse which accepts some long term prisoners from the other counties (there is no state prison) received 2,344 prisoners during the fiscal year and discharged 2,365. There were 333 inmates on June 30, 1950.

**Communications.**—The mileage of highways including rural roads under state control was 3,910. Income of the state highway department for the fiscal year ending June 30, 1950, including federal aid of \$2,145,669, was \$10,467,752; expenditures \$8,761,353. Railroad mileage was approximately 270.

For the calendar year tonnage at the port of Wilmington was 692,042 compared with 618,140 for 11 months of 1949; the value of cargoes was \$34,972,934 for the calendar year compared with \$33,980,633 for the first 11 months of 1949. Cargo tons (2,000 lb.) through the Delaware and Chesapeake canal in 1950 were 7,414,761; transits of vessels, 14,506. Operations at the New Castle county airport changed from predominantly civilian to predominantly military upon establishment of a U.S. air force complete reserve training centre. Civil-local flights dropped from 53,870 to 11,776 during the fiscal year, carrying 14,041 passengers; 91,122 lb. of air mail were carried by the regular lines, 270,468 lb. of air express and 764,415 lb. of air freight. The city of Wilmington had four radio stations. On Nov. 30, 1950, the state had 117,206 telephones in use.

**Banking and Finance.**—There were 27 state banks, mutual savings banks and trust companies with 6 branch banks and 12 branch offices; 13 national banks, 39 building and loan associations and 20 small loan companies. Total assets of all state banks June 30, 1950, were \$651,190,763 compared with \$557,028,448 on the same day in 1949; deposits June 30, 1950, were \$580,305,507 compared with \$489,508,176 on the same day in 1949. Assets of the national banks were \$42,860,446 June 30, 1950, compared with \$41,742,597 on the same day in 1949.

Total state revenue for the year ending June 30, 1950, was \$37,578,930.-14; nonrevenue income \$40,243,722.32; total \$77,822,652.46. Expenditures were \$54,429,436.22. The excess income over expenditures plus the balance of \$13,527,308.78 equalled \$36,920,525.02. The gross debt was \$36,750,000. Total debt service (interest and redemptive) \$662,092.

**Agriculture.**—The estimated total cash income from agricultural production in 1950 was \$100,000,000. Total livestock income (estimated) was \$67,383,000 (including the large broiler industry for which separate data were not available.) The total from crops from January to October was \$13,508,000.

Table I.—Leading Agricultural Products of Delaware

Crop	1950	1949	Average 1939-48
Corn, bu. . . . .	5,256,000	4,380,000	3,992,000
Apples, bu. (commercial) . . . . .	525,000	624,000	661,000
Hay, tons . . . . .	96,000	90,000	96,000
Wheat, bu. . . . .	1,037,000	1,202,000	1,228,000
Tomatoes, tons (processed) . . . . .	40,000	45,000	
Strawberries, crates . . . . .	50,000	63,000	
Lima beans, tons shelled . . . . .	15,610	16,200*	

\*Revised.

**Manufacturing.**—Gross receipts of 979 licensed manufacturers for the year ending June 30, 1950, were \$285,273,053, compared with \$185,246,-411 in the previous fiscal year. The total of employees under the unemployment compensation law July 1, 1950, was 103,788. Total wages for the year ending June 30, 1950, were \$299,659,522. On Nov. 15, 1950, 562 plants in the Wilmington area reported an employment total of 62,785 compared with 56,287 for Nov. 15, 1949. New corporations chartered at Dover for the year ending June 30, 1950, were 2,464 compared with 2,333

Table II.—Principal Industries of Delaware

Industry	1950	1949
Food . . . . .	\$67,461,557	\$63,299,055
Clothing . . . . .	75,811,606	17,095,871
Household supplies . . . . .	11,129,538	458,643
Auto supplies . . . . .	10,227,693	6,100,656
Drugs and medical supplies . . . . .	3,274,467	8,066,907
Tobacco . . . . .	433,938	397,120
Miscellaneous . . . . .	126,934,254	89,828,159

in the preceding year. Dissolutions were 1,171 compared with 977 in 1949. Miscellaneous manufactures in Table II include chemicals, shipbuilding, fibre, leather, textiles, foundries and machine shops—the notable industries of the Wilmington area.

**Mineral Production.**—According to the federal census of manufactures in Delaware (1947, released 1949), the total value added by manufacture of stone, clay and glass products was \$1,011,000. (J. EN.)

**Democracy.** During 1950 the word democracy was used with two opposite meanings. Communists used the word democracy, sometimes also called people's democracy or true democracy, to connote their own system. That kind of "democracy" is discussed in the article COMMUNISM. It represents the very opposite of that form of government and way of life which is based upon the multiparty representative system, respect for individual liberty and the freedom of discussion and expression as established in the constitutional struggles from the 17th to the 19th centuries. Democracy in this sense only is considered here.

Democracy during 1950 was consolidated and strengthened wherever it existed. In the 1930s fascism in its various forms appeared as the most powerful challenge to democracy and regarded itself as the "wave of the future." In 1945 fascism suffered a crushing defeat. It was replaced by communism as the chief threat to democracy. Many began to regard communism as the "wave of the future." However, in 1950, as in the preceding year, every free election held in the western world, even in countries in the immediate shadow of the soviet army, testified to the vitality of democracy and to the decline of communism in free competition. Nor did the Communist "peace" propaganda impress the democratic world. The act of Communist aggression against the Republic of Korea in June 1950 united almost the whole non-Communist world and revealed even to many sympathizers with communism the hollowness of Communist "peace." The democratic nations of the North Atlantic area drew more closely together under the threat of communism and the appointment of Gen. Dwight D. Eisenhower (*q.v.*) as commander in chief of all the North Atlantic treaty nations' armies in Europe became the visible symbol of this growing unity.

The weakness of communism in the western world showed itself even in the soviet-occupied zone of Austria where in the municipal elections of May 7 the Communists received only slightly more than 5% of the votes, a little less than in 1949. In all the cities where in 1945 Communist municipal administrations had been introduced, like industrial St. Poelten, the municipal administration fell into the hands of the non-Communist governmental parties. The Catholic People's party which campaigned on an outright anti-Marxist platform, received about 52% of all the votes, the moderate socialists 40%. Similarly the Communists were defeated in all elections held in western Germany. In west Berlin about 90% of all the voters went to the polls on Dec. 3 in spite of an intensive Communist propaganda campaign to dissuade west Berliners from voting. The moderate Social Democrats polled 44.7% of the votes, the Christian Democrats 24.6% and the Free Democrats 23.0%. The vote in the proletarian districts which had been heavily Communist before 1933, Reinickendorf, Wedding, Neukoelln and Tempelhof, turned out as strongly anti-Communist as all the other parts of the city. In the elections for the west German states of Hessen and Wurttemberg-Baden on Nov. 19 the Communist party, for the first time since the end of World War II, failed to win even the 5% of the total votes required for a seat in the parliaments. A week later, in the elections in the state of Bavaria, the Communists received only 1.9% of the very large total vote. In all these elections it was the moderate Social Democratic party which found the strongest support among the voters. This was also the case in the elections in Schleswig-Holstein on July 9 where the vote for the Communists dropped from 43,000 to 28,000.

Elections in other European countries presented the same picture. On April 26 the Communist vote in the provincial elections in Amsterdam, the Netherlands, a stronghold of the Communists, fell from 31.5% in 1946 to 24.6%, and in The Hague from 8.2% in 1946 to 7.5% in 1950. Of the 590 seats of the Dutch provincial parliaments the Communists in 1946 gained 58 seats and in 1950 only 31 seats. In Belgium the Communists held 12 seats in the chamber of deputies in 1949 and 5 in the senate; in 1950 their numbers dropped to 7 in the chamber of deputies and 3 in the senate. In Switzerland where the Communists had shown some strength in the Zurich municipal parliament elections of 1946, the elections of March 1950 reduced their representation to 4. Nor was the verdict of the voters different in Denmark. The national elections of Sept. 5 reduced the number of Communist deputies among the 149 members of the *folketing*, the Danish house of representatives, from 9 to 7. Swedish municipal elections on Sept. 17 brought the Communists an even greater reduction of their representation in the city and town councils from 91 to 29 seats, and in Stockholm from 17 to 5 seats. An even more crushing defeat was administered to the Communists in the general elections in Britain in Feb. 1950. The Communists polled only 91,815 votes in a total of 28,724,754 and lost the 2 seats which they held in the previous parliament, even then an insignificant minority among 640 deputies. In the November elections in the United States the only representative of the Communist trend in the previous congress lost his seat.

Thus it can be asserted that in all democratic countries wherever full freedom of speech, press and assembly existed, communism was rejected by the overwhelming majority of the voters. In Uruguay, one of the few Latin-American countries with a developed democracy, the Communist party suffered a similar rout at the national elections in Nov. 1950. Only in Italy and to a much lesser degree in France did communism retain a stronghold over a relatively considerable minority of the population, especially among the workers in both countries and the peasants in Italy. To counteract the Communist-dominated World Federation of Trade Unions which controlled most of organized labour, the International Confederation of Free Trade Unions was founded with the support of the American Federation of Labor and of the Congress of Industrial Organizations, with its seat in Brussels, Belgium. This confederation planned to organize regional meetings in Asia and in Latin America to spread free trade unionism. The confederation co-operated closely with the Free Trade Union Centre in Exile representing the democratic labour movements in the countries behind the "iron curtain" and in Spain.

The events of 1950 proved the strength and vitality of democracy in all western lands in spite of the challenge of communism. Two countries in which democracy made definite gains during the year were Greece and Turkey. In Greece general elections were held on March 5 in an atmosphere of liberty, freedom of movement and personal security, unknown in that country for many years. Of the 250 seats in the new chamber the extreme left, organized under the name Democratic front, received only 18 seats and the extreme right, calling itself Independent Political front, received only 16 seats. Even more significant was the development in Turkey. This young republic had been ruled for 27 years by the Republican People's party with practically dictatorial power. In the last years opposition was admitted, and the elections of May 14 brought a complete victory of the opposition, the Democratic party. The ruling party yielded in the best democratic tradition to the freely expressed will of the people.

The only real threat to democracy in 1950 was not offered by a weakness within but by the danger of military conquest from without. Democracy is a system of life glorifying peace and co-operation among classes and nations in the interests of general

FIRST SECRET BALLOTING in Turkish history, during the elections of May 1950. An estimated 7,500,000 of the 9,000,000 registered voters cast ballots and brought a surprise defeat for Pres. Ismet İnönü's Republican People's party

harmony and well-being. It is difficult for democracy to understand the challenge of systems which believe in class or national warfare as the fundamental principle of history. It took the democracies a long time in the 1930s to prepare and to unite against the threat of fascism. In 1950 the democracies, aroused by the Communist aggression against the Republic of Korea, started to pool and mobilize their moral, economic and military resources. They hoped thereby to prevent further acts of Communist aggression and to avert the disaster of a new general war. Under the leadership of the United States, which in the 1940s emerged as the most powerful democracy, the foundation was laid for a union of the democratic nations organized in the North Atlantic treaty community. FILMS OF 1950.—*Why We Respect the Law* (Coronet Instructional Films.) (H. Ko.)

**Democratic Party.** The Democratic party in 1950 suffered from reverses at the polls and from intraparty dissension involving key members of congress and distinguished party members. At the end of the year, Pres. Harry S. Truman and National Chairman William M. Boyle, Jr., were engaged in making new plans for rebuilding the organization which had kept the party in the White House for 17 years.

In the elections of Nov. 7, the Democrats lost 5 senate seats and 30 in the house, leaving them a margin of only 2 in the upper chamber and 35 in the lower. They lost six governorships to the Republicans, which gave the G.O.P. control of 25 of the 48 state governments.

The Democrats professed to find consolation from the fact

that their 1950 losses were fewer than in such off-years as 1934, 1938, 1942 and 1946. But there were certain features of the 1950 rebuff that seemed to offset these comforting conclusions.

The Democratic vote in the great cities—New York, Pittsburgh, Cleveland, Chicago, San Francisco, Los Angeles—hit a record low from pre-Roosevelt days. This indicated that many groups once loyal to New Deal-Fair Deal policies and promises—labour, liberals and racial blocs, especially the Negro race—had fallen away. It was also considered significant that several Truman leaders on Capitol Hill, including Senate Majority Leader Scott W. Lucas of Illinois and Senate Whip Francis J. Myers of Pennsylvania, were defeated. Moreover, many severe Truman critics, notably Sen. Robert A. Taft of Ohio, won by record majorities.

Finally, the retirement of so many key senators and governors left the Democrats with a shortage of manpower. Save for President Truman, the year closed with no 1952 presidential prospects on the horizon. There was also a dearth of vice-presidential possibilities, in view of the fact that Vice-President Alben Barkley would be 75 in 1952.

The outcome was a surprise to President Truman and Boyle, who had forecast an easy victory and gains. Boyle showed his concern when, a few days after election, he asked local and state leaders to report formally on why their calculations had misfired. He was especially concerned over the party's poor showing in industrial and rural areas, for it had been the loose alliance of labour and farm groups that accounted for so many past triumphs. In the 1950 contest, however, eight farm states that had contributed surprisingly and heavily to Truman's 1948 win returned to Republicanism.

From the long-range viewpoint, politicians thought the result significant because the election was fought on issues of fundamental importance to Democratic policies and philosophy—national health insurance, the Brannan farm plan, Taft-Hartley repeal, civil rights, etc.

Although a first-term senator, Joseph R. McCarthy (Rep., Wis.) made himself a dramatic and influential campaign figure. Throughout 1950 he peppered the administration with charges that it had "coddled Communists" in the state department, to the detriment of a strong anti-Russian stand. Truman's characterization of this indictment as a "red herring," combined with conviction of Alger Hiss, former state department official, of perjury for denying that he had passed official secrets to Moscow agents, gave colour to McCarthy's allegations. They admittedly hurt the Democrats in many states, notably New York, Maryland, Ohio and California.

President Truman said he was not disappointed with the election results, and declared he would resubmit his Fair Deal program to the 82d congress, opening in Jan. 1952. But even as he spoke, military reverses in Korea and the threat of World War III made it clear that, as in 1941, social and economic reforms would be laid aside on Capitol Hill for an indefinite period.

Truman had originally planned an active campaign, but official pressures forced him to confine his activity to a 16-state, 6,400-mi. tour across the northern tier in May, and a single speech on the Saturday night before election. In his spring swing, he defended his Fair Deal and demanded defeat of "obstructionists and isolationists" of both parties. As in his 1948 "give 'em hell" effort, he denounced Republican opponents as "old fogies, reactionaries and captives of Wall street." In his only election speech at St. Louis, Mo., he predicted a great Democratic victory, also declaring that any workingman or farmer who did not vote Democratic ought to have his head examined.

The congressional line-up resulting from the November contest forecast party difficulties on Capitol Hill. The coalition of Republicans and conservative southern Democrats, which had blocked enactment of Truman's major legislative proposals for

five years, had been strengthened. Only on demands for rearming the United States and overseas allies against the Russian menace could the president be sure of support. Indeed, on this question the congress had long been more forehanded than the executive branch.

The breakup of several once dominant city machines was another 1950 setback for the Democrats. The 1949 dethronement of Boss Frank Hague of New Jersey was made more permanent. Tammany's mayoralty candidate, Judge Ferdinand Pecora, was beaten by an independent entry, Vincent Impellitteri. The Chicago machine gave Senator Lucas the low majority of 138,082. Senator Taft carried almost every industrial centre in Ohio.

Southern Democrats continued to harass the Truman-Boyle "regulars," with James F. Byrnes of South Carolina as spokesman. Although Byrnes was once Truman's close personal friend and secretary of state, they broke after Byrnes made a speech in 1949 in which he said that, unless Fair Deal legislation were checked, every citizen would become an "economic slave pulling an oar in the galley of the state."

Truman was unusually unfortunate in his relations with prominent southerners. After the "economic galley slave" remark, he wrote Byrnes to suggest that his was another "*et tu, Brute*" act. The South Carolinian replied, characteristically, that he did not consider himself a Brutus, nor Truman "a Caesar."

Although a septuagenarian and a veteran of 40 years of Democratic service, Byrnes then ran for governor and won without opposition. He indicated that he might use his office and prestige to organize a southern faction antagonistic to President Truman's renomination and re-election. Two other southerners who indicated dissatisfaction with the administration's domestic program, although supporting the White House on foreign policy, were Sen. Harry F. Byrd of Virginia and Jesse H. Jones of Texas, secretary of commerce under Roosevelt.

An anti-Truman movement headed by men of this type, Democratic politicians feared, might mobilize a far more powerful

revolt in 1952 than the Dixiecrat rebellion of 1948 which cost Truman the four states of South Carolina, Louisiana, Alabama and Mississippi.

James A. Farley, former Roosevelt postmaster general and national chairman, also joined the Truman critics. He supported Acting Mayor Impellitteri against the Tammany-White House nominee in New York city and gave no help to the national organization in the campaign. In a November address before the Florida chamber of commerce he indicated for the first time in public that the administration's general domestic program was too radical for him. (See also ELECTIONS; UNITED STATES.)(R. Tu.)

**Denmark.** A monarchy of north central Europe, Denmark has an area of 16,569 sq.mi.; pop. (1945 census): 4,045,232 (mid-1949 est., 4,230,000). Capital: Copenhagen (731,707, or including Frederiksberg and Gentofte 927,404; 1948 est., 979,880). Other principal cities (1945 census): Aarhus (107,393); Odense (92,436); Aalborg (60,880). Religion: Lutheran Christian. Ruler in 1950: King Frederick IX; prime minister: Hans Hedtoft, to Oct. 26; Erik Eriksen after Oct. 28.

**History.**—The Social Democrats had held the reins of government since the autumn of 1947, but they were a minority government. The weakness of their position was accentuated by the growing tensions of the economic problem, and at the end of Oct. 1950 they gave way, and a new ministry was formed by a combination of the Liberals and the Conservatives.

In the municipal elections of March 1950 a trend to the right was evident. In 20 cities the Communists retained only 9 of their former 25 posts, the Social Democrats 148 of 150, the Liberals 36 of 45, while the Conservatives increased their places from 51 to 54 and the Justice party (followers of Henry George) from no seats at all gained 7. Special lists, formerly with 17 seats, placed 28. Such straws in the wind boded ill for the Social Democrats, and a national test seemed sure to come.

The methods of taxation for defense purposes caused a government crisis in August. The appropriation asked for was voted without serious question, but the austerity measures demanded by the government caused dissatisfaction. Hence on Sept. 5 the nation went to the polls. Results were far from satisfactory to a government seeking popular approval:

	Seats after 1947 election	Seats after 1950 election
Social Democrats . . . . .	57	59
Liberals (Venstre) . . . . .	46	32
Conservatives . . . . .	17	27
Radical Liberals . . . . .	10	12
Justice Union (single tax) . . . . .	6	12
Communists . . . . .	9	7
Others . . . . .	4	..

Lack of enthusiasm for the Social Democrats was obvious, yet no other party had so many representatives. Attempts to form a coalition cabinet under Social Democratic leadership produced no results, and Premier Hans Hedtoft was prevailed upon by the king to carry on with his minority rule. For a few weeks it appeared that general submission would enable this regime to continue, but at the end of October the other parties revolted on the issue of butter rationing—which the opposition wished to abandon.

By a four-vote majority the ministry was defeated and resigned on Oct. 26.

King Frederick IX called upon Erik Eriksen, leader of the Liberal (Venstre) party, to form a new government, built of a coalition representing a real majority. Eriksen was able to create a ministry, however, of only Liberals and Conservatives. These two parties held 59 seats, exactly the same as the Social Democrats, and were therefore in a precarious position. Nevertheless, the king on October 28 accepted the new coalition group. Erik Erikson was prime minister, with Ole Björn Kraft of the Con-

"SHUCKS, OUT OF PEPPER!" cartoon comment by Werner of the *Indianapolis Star* on the failure of Claude Pepper to win the Democratic senatorial nomination in the Florida primaries of 1950

'ANALYZING SAMPLES of Danish soil collected in a search for oil by the Danish American Prospecting company during 1950. Axel Nörvang, scientific leader of the project, is shown at the microscope

servative party as vice-premier and minister of foreign affairs. A lawyer, Helga Pedersen, became the first woman minister of justice.

Economic difficulties threatened Denmark's high standard of living. The devaluation of Sept. 1949 had hit Denmark particularly hard, for that country normally sold its agricultural export to Great Britain and got payment in sterling, now depreciated. But Denmark bought its machinery and "colonial" products in the dollar market, with prices suddenly higher. It could not increase or redirect its exports enough to close this gap.

Foreign observers became increasingly critical of Denmark as a country which was receiving considerable amounts of Marshall plan aid (\$87,000,000 in 1949-50), was maintaining and even expanding its social welfare program, and at the same time was using up reserves.

Even the Danes agreed that belt-tightening was in order, but the prospect was painful and the methods for new taxation were debatable.

The Danes increased their budget for defense from 305,000,000 Kr. to 353,000,000 Kr. (about \$51,000,000). This was only 2% of national income, as compared with similar expenses in Britain of 7.6%, the Netherlands 7.7%, Norway 4.5% and the U.S. 6.4%—all for estimates prior to the Korean war. In the general rearming that followed the challenge in the far east, Denmark almost doubled its appropriations. The country also furnished a hospital ship for the use of the United Nations (the "Jutlandia") and a merchant vessel of 6,000 tons as well (the "Bella Dan"). Denmark wanted definitely to play its part, but it was hard when most of the people felt that nothing they could do would prevent the country from being overrun in a general war.

Denmark's direct external troubles centred in the Baltic, where several Danish fishing boats were captured by the Soviets and held for a few weeks. When a U.S. plane disappeared over the Baltic in April, the U.S. was allowed to use air bases in Denmark for its searching planes. Denmark and Sweden stood firmly together against the Russian demand for a 12-mi. limit off her shores.

Denmark continued to press for adjustment of the refugee problem in neighbouring south Schleswig where the Danish minority struggled to maintain its rights.

The Danes also had problems in the more distant Faeroes, and in Greenland (q.v.).

**Education.**—Schools (1948-49): elementary, middle and secondary 4,143, pupils 486,863; technical 340, pupils 53,000; commercial 198, pupils 34,000; agricultural 25, pupils 2,400; adult 55, pupils 7,300; teachers' training colleges 18, students 2,500; universities 2, professors and lecturers 230, students 7,300; institutions of higher education 7, professors and lecturers 152, students 5,193. No illiteracy.

**Finance and Banking.**—Budget: (1950-51 actual) revenue 2,040,000,000 Kr., expenditure 2,033,000,000 Kr.; (1951-52 est.) revenue 2,163,000,000 Kr., expenditure 2,151,000,000 Kr. Net foreign debt (Dec. 31, 1949) 2,378,000,000 Kr. Currency circulation (Aug. 1950): 1,439,000,000 Kr. Bank deposits (Aug. 1950): 4,914,000,000 Kr. Gold and foreign exchange (Sept. 1950): U.S. \$79,000,000. Monetary unit: krone (pl. kroner) with an exchange rate of 6.9 Kr. to the U.S. dollar.

**Foreign Trade.**—(1949) Imports 4,205,000,000 Kr.; exports 3,564,000,000 Kr. Main sources of imports (1949): United Kingdom 32%; U.S. 16%; Sweden 7%. Main destinations of exports: United Kingdom 44%; Germany 7%; Norway 5%.

**Transport and Communications.**—Roads (1949): 34,564 mi. Licensed motor vehicles (Dec. 1949): cars 111,417; commercial 57,777. Railways (1949): 2,110 mi.; freight net ton-miles 693,000,000. Shipping (July 1949): number of merchant vessels over 100 gross tons 698; total tonnage 1,170,373. Air transport: passenger-miles (1949) 36,031,000. Telephone subscribers (1948): 470,292. Radio receiving sets (1949): 1,201,600.

**Agriculture.**—Main crops (metric tons, 1949): wheat 299,000; barley 1,571,000; oats 982,000; rye 469,000; potatoes 1,794,000; sugar, raw value 246,000. Livestock: cattle (July 1950) 3,044,000, of which cows in milk 1,572,000; sheep (July 1949) 67,000; horses (March 1950) 482,000; pigs (Jan. 1950) 3,208,000; chickens (March 1950) 18,532,000. Dairy production (metric tons, 1949): milk 4,884,000; butter 156,000; cheese 63,600; eggs 118,000. Meat production (metric tons, 1949): total 400,000, of which beef and veal were 131,000 and pork 266,000. Fisheries (1949): total catch 227,289 metric tons valued at 177,500,000 Kr.

**Industry.**—Industrial establishments (June 1948): 109,288; persons employed 641,379. Fuel and power (1949): coal distributed 7,368,000 metric tons; manufactured gas 369,600,000 cu.m.; electricity 1,636,000,000 kw.hr. Manufactures (1949): cement 834,000 metric tons; new dwelling units 244,800.

**Dentistry.** During 1950 U.S. dentistry was engaged in appraising the advances which it had made in the first half of the 20th century. At the turn of the century one year of high school training was the educational requirement for admission to a dental school. The dental course leading to the dental degree was three years. By 1950, two years of training in a college of arts or science and four years of training in the dental school were the minimum educational program. The proprietary dental schools conducted for private profit were extinct. Of the 41 schools in operation at the close of 1950, 38 were integral units of universities. Of these, 14 were in state universities and 24 in privately incorporated universities.

There were more than 11,000 students enrolled in the accredited dental schools of the United States of which more than 3,000 had offered a bachelor's degree in arts or science for admission.

The dental schools offered postgraduate and graduate instruction and in the past few years more than 650 advanced degrees had been awarded.

One of the principal objectives of dentistry in 1950 was the attainment of more and more prevention of dental disease. This involved a knowledge of the causes of disease. An increasing amount of research in learning the causes of dental caries and the various diseases of the gums had resulted in the recognition of the value of the fluorinization of public drinking water supplies, the use of the ammonium ion in dentifrice preparations and the cleaning of the mouth immediately after partaking of food. All these activities were contributing to a reduction of the incidence of dental caries.

The importance of dental research in promoting the public

DENTAL X-RAY MACHINE for picturing all upper or lower teeth on one film being demonstrated at the University of Washington School of Dentistry in 1950. The patient remains in a fixed position in the dental chair while the machine and chair slowly revolve

health was recognized by the federal government by the passage of a dental research bill authorizing \$2,000,000 for a dental research building and \$750,000 annually for research work. The bill was signed by the president June 24, 1948. Improvements in techniques and in materials kept pace with education and research.

Advances in the literature of dentistry also made notable gains. Proprietary dental journals no longer occupied any prominent place. Dentistry had developed its own journals and textbooks, which kept pace with the rest of dentistry's achievements.

But most significant of all was the development of an appreciation of dentistry's social responsibilities. Its recognition of its share of responsibility for the dental health of all the people; its strong emphasis on dental health education programs; its interest in providing dental care for all the people without undue government regulation or control; its efforts to control dental disease through expansion of community dental programs integrated in the general health program; its adoption of measures to make dental practice in smaller cities and rural communities more attractive and rewarding; and its development of auxiliary personnel particularly through encouragement of the education of the dental hygienist were all aimed at better dental health for the American people.

FILMS OF 1950.—*Teeth Are to Keep* (Encyclopædia Britannica Films Inc.).

**Dermatology.** Cortisone and ACTH (adrenocorticotrophic hormone) were used for treatment of a number of cutaneous diseases during 1950, including acute lupus erythematosus, dermatomyositis, scleroderma, panarteritis nodosa, psoriasis, pemphigus, hypersensitivity states such as drug eruption, exfoliative dermatitis, severe urticaria, eczema-dermatitis and the group of lymphoblastic diseases—leukemia, Hodgkin's disease and mycosis fungoides.

The most impressive results were obtained in the treatment of acute systemic lupus erythematosus, a disease that in many instances is fatal. In a number of cases, even when patients were moribund, the clinical symptoms were suppressed quickly and dramatically and remissions resulted, while formerly remis-

sions had occurred only rarely in acute lupus erythematosus.

In some cases of severe penicillin reactions, ACTH and cortisone produced striking results when all of the usual treatments failed.

Adverse and, in general, unimportant cutaneous side effects from treatment were noted not infrequently. Oedema, mild cutaneous haemorrhages, delayed wound healing, acne, hirsutism of the face, linear scars on the abdomen and breasts, hyperpigmentation, thinning of the scalp hair, a rounding of the face and abnormal deposit of fat on the neck and buttocks were observed. Fortunately, except for the linear scars, the changes were reversible and it was later determined that they could be prevented by proper dosage.

Studies were being conducted to determine an optimum dosage technique, the effect of small maintenance doses by prolonged administration, the use of slowly absorbed vehicles, methods of administration other than by injection and the mode of action of the drugs.

One of the drawbacks to penicillin G, the form of penicillin that usually is employed in treatment, is that it stimulates the development of allergic reactions in a rather high percentage of cases. These disturbing reactions were prevented successfully by a new synthetic crystalline preparation designated penicillin O, allylmercotomethyl penicillin. Its use by inhalation, oral troches and parenterally in 57 patients sensitive to penicillin G produced no untoward reactions, and it proved as effective therapeutically as penicillin G. Fourteen of the patients were deliberately treated with penicillin G again later without the recurrence of the untoward reactions they had experienced before they had received penicillin O—which indicated that penicillin O may not only prevent reactions but may act also as a desensitizing agent.

Banthine, a synthetic drug which acts upon the parasympathetic nerve endings, was found to be effective for reducing bothersome excessive perspiration. It is an anticholinergic drug originally introduced for the treatment of peptic ulcer. It was noted that within 45 min. after 100 mg. of the drug were swallowed cold moist palms became warm and dry. After its effect upon several patients was studied, the optimum dosage was found to be 50 to 70 mg. every four hours and 100 mg. before activities associated with stress. The drug caused dilation of the pupils of the eyes, dry mouth, a tendency to constipation and some blurring of vision. It should not be used by anyone suffering from glaucoma.

Eurax, N-ethyl-o-Crotono-tobide, was originally introduced as a parasiticide for the treatment of scabies. Not only was it an effective miticide, but it was subsequently found to be fairly effective as an antipruritic agent to relieve the itching of a number of other diseases besides scabies—diseases such as varicose eczema, senile pruritus, neurodermatitis, etc. After it was applied there was at first a sensation of warmth, then relief from the itching which was effective for from 4 to 18 hr. The ointment was aesthetically and cosmetically acceptable, easy to apply and to remove, and it did not stain. Approximately 1 in 400 persons was irritated by it. The drug had no curative effect upon the lesions of the diseases but it did afford relief from itching—except when the eruptions were acutely inflamed.

It seemed possible that a new usefulness other than as an anti-urticarial agent might be found for some of the antihistaminic drugs. Prompted by the observation that ringworm infection of the feet responded dramatically to applications of a cream containing 2% pyribenzamine, studies were undertaken to determine whether the effect noted was solely against the allergic manifestations incited by the infecting organisms or whether the antihistaminic compounds possessed fungistatic or fungicidal

properties as well. Three compounds were studied—antistine, pyribenzamine and diphenylpyraline. The results obtained indicated that the latter two compounds possessed properties that were inhibitory to pathogenic fungi. (See also MEDICINE.)

**Detergents:** see CHEMISTRY.

**Detroit.** Wayne county seat and hub of the southeastern Michigan industrial area, Detroit is a city of varied manufactures, with steel increasing as a major product. While often regarded as primarily an automotive city, actually more than half of its production workers are in nonautomotive industries.

The 1950 census, preliminary report, gave Detroit a 1,838,517 population. Previously fourth city of the United States, it dropped to fifth rank with Los Angeles surpassing it. The area is 137.9 sq.mi.

Detroit's so-called metropolitan area, embracing numerous adjacent communities including two completely encompassed by Detroit, had a 2,973,019 population according to the 1950 census, preliminary figures. These many suburbs, while some are highly industrialized, furnish much of the living space for those employed in Detroit proper.

Their role in this capacity is indicated by the fact that late in 1950 three times as many new homes were being built in them as within Detroit itself. The predominance of single dwellings was reflected in the estimate that more than 70% of Detroit's homes were owner-occupied.

Municipal government is nonpartisan and the nine-man common council is elected at large. Administrative and aldermanic terms are two years, with regular municipal elections held in the odd-numbered years. Municipal courts have jurisdiction over all criminal cases originating within the city, though prosecution is conducted by the county prosecutor's office. Civil processes are conducted in county courts.

The transportation system of streetcars, buses and trackless trolleys is city-owned, but not tax-supported. A municipal university, Wayne, is included in the school system.

The end of the 1950 fiscal year, June 30, showed municipal income exceeding expenditures, a reversal of the two preceding fiscal years. On that date the principal municipal financial statistics were as follows:

Assessed value, \$3,953,197,530; gross bonded debt (notes included), \$314,344,702; net bonded debt (notes included), \$281,487,010; net tax-supported debt, \$188,083,659; gross appropriations (including school, library and utility), \$300,362,853; tax levy (including school and library), \$131,706,861; tax rate (including school and library), \$33.094.

The principal civic accomplishment of 1950 was the United Foundation Torch drive. With a goal of \$10,300,000 for nearly 150 relief and service agencies, the drive was oversubscribed by \$100,000. This was the second year Detroit had succeeded with a unified fund-raising campaign, and its methods had become a subject of study by relief agencies over the nation.

In 1951 Detroit was to celebrate the 250th anniversary of its founding by French voyageurs. Its rule had been under three flags—French, English and U.S. Names of the older streets continued to commemorate the city's French origin. A geographical peculiarity exists in the fact that Detroit lies due north of Canadian territory from which it is separated by the Detroit river.

**Devaluation:** see EXCHANGE CONTROL AND EXCHANGE RATES.

**Diabetes.** The effort to discover the undiagnosed diabetics in the United States reached greater intensity during

1950 than in the two preceding years. A new feature was a two-day Diabetes fair held in Boston, Mass., in which the interest of the public in the problem was extraordinary. The all-day exhibits were crowded; the attendance was estimated at 10,000; 2,000 urine tests and 1,350 blood-sugar determinations were performed. Doctors, nurses, dietitians, technicians and volunteers shared in demonstrating the exhibits. Throughout the country the press, the radio, the druggists and the pharmaceutical manufacturers combined with the doctors to make the public conscious of diabetes, its symptoms and the significance of heredity and obesity in its aetiology.

NPH insulin, long used in Denmark, was recognized by the Insulin Committee of Toronto and put on sale on Oct. 16, 1950. It acts more slowly than regular and crystalline insulin, longer than globin but for a shorter period than protamine zinc insulin. One of its advantages is the possibility of its intensification and prompter action by the addition of regular insulin to it in the same syringe without conversion to protamine insulin.

Evidence showed that adrenocortical hormones act on carbohydrate metabolism by decreasing peripheral utilization of glucose and by enhancing gluconeogenesis, thereby increasing glycogen deposition in the liver. This results in a diabetic glucose tolerance curve at first, then in frank hyperglycaemia and glycosuria. Action in this respect can be considered as antagonistic to insulin. Whereas prolonged and intensive administration is necessary to produce an even mildly diabetic symptomatology in normal persons, short courses of relatively small doses result in a profound exacerbation of symptoms in patients with diabetes, even though this is mild.

This was interpreted as representing a lack of insulin reserve, and might in time be applied to the detection of as yet asymptomatic, preclinical diabetes. Thus far the diabetic symptoms produced had nearly always proven reversible after the discontinuation of these drugs.

H. Malmros in Sweden reported upon arteriosclerosis and diabetes in wartimes. Arteriosclerosis, the major complication in diabetes, arises relatively early in obese individuals, but is remarkably uncommon in the autopsies of those who have had long, wasting illnesses. It was less in those subjected to famine in World Wars I and II and reappeared with return of more food. Malmros pointed out that the qualitative composition of the diet, its content of cholesterol foods such as eggs, butter, cream, pork and animal fats was important. Thus these foods were less used in China where arteriosclerosis, coronary disease and hypertension were less frequent. He contrasted the high (141 per 10,000) and the low (42 per 10,000) incidence of these diseases in Sweden and in Italy with the consumption of butter, which was ten times as high in the former country. So too, in Stockholm, when in 1942-43 less cholesterol food was available, there was less arteriosclerosis; and myocarditis and diabetes decreased in 22 of the largest clinics during World War II and increased when food commenced to be plentiful. The contrast between the frequency of vascular disease and the diets of Finland and the United States supported the same idea. An individual in the United States consumed 130 g. of cholesterol per year and an individual in Finland 24 g. when the diet was low. Arteriosclerotic conditions in Norway showed a fall in the lean years, and in fact the mortality from myocardial disease and arteriosclerosis was 87 per 100,000 compared with 256 in the United States. Malmros concluded that there was much reason to reject the former belief that arteriosclerosis was caused only by age.

The prescription of a low cholesterol diet for diabetes was still debatable, because so much of the cholesterol is formed in the body.

\*Estimated.

The sales agreement of the Diamond Producers' association was extended six years from Jan. 1, 1950. The Diamond Purchasing and Trading company would handle gem stones, and the Association and Industrial Distributors Ltd. would handle industrial stones.

**United States Imports.**—In 1942-44 and again in 1948 the diamonds imported into the United States amounted to more than the world output for the year. The accumulated stocks that made this possible were depleted to such an extent that production was expanded in 1949. Imports declined sharply in 1949, allowing a substantial replenishing of stocks.

Table II.—U.S. Diamond Imports  
(Carats)

	Rough	Cut	Industrial	Total
1939 . . . . .	153,982	488,154	3,570,111	4,212,247
1940 . . . . .	227,886	321,471	3,809,856	4,359,213
1941 . . . . .	215,026	229,582	6,882,750	7,327,358
1942 . . . . .	278,437	126,004	11,204,754	11,609,195
1943 . . . . .	751,674	193,701	12,173,918	13,119,293
1944 . . . . .	896,547	169,097	12,656,823	13,722,467
1945 . . . . .	893,761	377,243	10,792,186	12,063,190
1946 . . . . .	1,044,517	604,638	4,705,118	6,354,273
1947 . . . . .	926,514	347,810	4,112,189	5,456,513
1948 . . . . .	909,871	388,499	10,648,250	11,946,620
1949 . . . . .	651,150	335,487	6,364,049	7,350,686

The values assigned to imports in 1949 were \$28,299,799 for rough stones, \$41,427,718 for cut stones and \$17,666,479 for industrial stones; total value \$87,396,996 in 1949, compared with \$133,914,089 in 1948. (G. A. Ro.)

**Diels, Otto** (1876— ), German chemist, was born at Ham-burg, Ger., Jan. 23. He was the son of Hermann Diels of Berlin, a well-known classical scholar. Educated at the Royal Joachimsthal gymnasium and at the University of Berlin, he graduated as a doctor of philosophy in 1899 and became an assistant in the Chemical institute in the same year. He was appointed a recognized teacher of chemistry in 1904 titular professor in 1906 and extraordinary professor in 1914. After 1916 he was professor of chemistry and chemical technology and director of the Chemical institute at the University of Kiel. In 1950 the Nobel prize for chemistry was awarded jointly to Diels and his former pupil, Kurt Alder (*q.v.*), for their work on diene synthesis. The formation of organic chemical compounds by diene synthesis (the Diels-Alder reaction) had been recorded by earlier workers, but Diels and Alder provided the first experimental proof of the nature of the reaction and demonstrated its

wide application to the synthesis of ring compounds of many types. Study of the reaction contributed greatly to knowledge of the processes by which plastic materials of great practical value were obtained. Diels was also noted for his work on other aspects of organic chemistry and in particular for his studies on cholesterol. He was the author of textbooks on both organic and inorganic chemistry and of numerous papers. (W. J. Bp.)

**DiSalle, Michael V.** (1908— ), U.S. public official and lawyer, was born in New York, N.Y., Jan. 6. He attended school in Toledo, O., and was graduated in law from Georgetown university, Washington, D.C., in 1931. He began his legal career as assistant district counsel of the Home Owners Loan corporation in 1933. He served in the Ohio legislature in 1937 and 1938, and was assistant city law director of Toledo from 1939 to 1941. DiSalle was a member of the Toledo city council from 1942 and served two terms as the city's vice-mayor before being elected mayor in 1947 and again in 1949. He served as chairman of the advisory board of the U.S. Conference of Mayors. He was also chairman of the Toledo Labor-Management Citizens committee which attracted national attention for keeping industrial peace during World War II. Pres. Harry S. Truman named him director of price stabilization Nov. 30, 1950.

**Disasters.** During 1950 loss of life and property in disasters included the following:

#### Aviation

- Jan. 27 Yukon territory, Canada. Forty-four persons aboard a U.S. air force C-54 plane were lost when the craft disappeared on a flight to the U.S.
- March 7 Minneapolis, Minn. Fifteen persons died when a civilian transport plane struck a flagpole while attempting a landing, plunged into a residence and exploded.
- March 12 Near Cardiff, Wales. Eighty persons aboard a chartered air liner, returning to Wales after attending the international Rugby championships in Belfast, Northern Ireland, died when the plane crashed near its port of destination. Three persons aboard survived the worst air disaster in world aviation history.
- April 21 Southwest of Tokyo, Japan. Thirty-five U.S. occupation personnel, including 5 high officials of Gen. Douglas MacArthur's headquarters, were killed when a U.S.A.F. transport crashed in mountainous territory.
- May 24 Southern Colombia. Twenty-eight persons aboard a transport plane died when the craft struck a volcano.
- June 5 Atlantic ocean, 330 mi. northeast of Miami, Fla. An unscheduled passenger transport plane carrying migratory workers from Puerto Rico to New Jersey crash-landed in the water. Of the 65 persons aboard, 45 were later saved by surface craft.
- June 9 Near Maracaibo, Venezuela. Fifteen persons, including 12 members of a U.S. missionary party and 3 crewmen, died when their plane crashed. The wreckage was discovered three weeks later.
- June 12 Persian gulf near Bahrein. Forty-one persons were known dead and 6 additional passengers of the 52 aboard were missing and presumed dead when an Air France DC-4 passenger plane crashed in its approach to land at Bahrein.
- June 14 Persian gulf near Bahrein. Forty persons aboard a second Air France plane were killed and 13 were saved when the craft crashed in circumstances identical with the one above.
- June 24 Lake Michigan, off South Haven, Mich. Fifty-eight persons were killed when a commercial air liner crashed into the lake. Reason for the disaster was never fully ascertained, and only fragments of the plane and bodies of those aboard were found.
- July 9 Casablanca, French Morocco. Twenty-one of 30 persons aboard were killed when a French passenger plane crashed shortly after taking off. Witnesses said an engine caught fire during the take-off.
- July 17 Punjab, India. All 22 persons aboard an Indian transport aeroplane died when the craft crashed in the Himalayan foothills. Among the victims were U.S. and Canadian members of a U.N. team policing the India-Kashmir truce area.
- July 23 Near Myrtle Beach, S.C. Thirty-nine members of the air national guard were killed when their plane developed engine trouble, crashed and exploded. There were no survivors.
- July 27 Near Oshima Island, Japan. Twenty-five persons, including 4 war correspondents, were missing and given up for lost after a U.S. transport plane plunged into the sea en route from Tokyo to Kyushu. There was 1 survivor.

- July 28 Near Porto Alegre, Brazil. Forty-three passengers and 6 crew members of a Brazilian Constellation plane were killed when the craft crashed and caught fire.
- July 29 Sahara desert. A French air liner crashed with 26 persons aboard, and all were presumed dead.
- Aug. 5 Fairfield-Suisun Air base, Calif. A bomb-laden B-29 bomber crashed and its bomb load exploded, with the result that 12 military personnel aboard died and 8 were injured, while 6 firemen died in rescue attempts and 60 residents of a nearby trailer camp were also injured.
- Aug. 31 Northwest of Cairo, Egypt. A U.S. air liner crashed and burned, killing 55 persons, including 23 from the U.S.
- Oct. 17 London airport, Heathrow, Middlesex. A British air liner plunged into a yard in a London suburb, killing 28 of the 29 persons aboard.
- Oct. 31 London. A fog-bound British air liner, attempting to land by the ground control approach system, overshot the runway and crashed into a stack of iron pipes; 28 of the 30 persons aboard died in the ensuing fire.
- Nov. 3 Mont Blanc, France. Forty-eight persons aboard an Air India Constellation plane died when the craft crashed on western Europe's highest peak.
- Nov. 7 Near Butte, Mont. Twenty-two persons were killed when a Northwest Airlines plane crashed just below the continental divide at Homestake pass.
- Nov. 13 Near Grenoble, France. A Canadian plane carrying 51 passengers, most of them Canadian pilgrims returning from a Holy Year visit to Rome, and a crew of 7 crashed, killing all aboard.
- Nov. 21 Mt. Moran, northwest Wyoming. A twin-engined transport plane carrying members of the New Tribes mission, a religious sect, crashed, killing 21 aboard.
- Dec. 9 Near Bangui, French Equatorial Africa. A French transport plane carrying Senegalese soldiers crashed. Of 58 persons aboard, 38 were killed, 4 missing and 3 injured.
- Dec. 13 Near Coimbatore, Madras, India. A total of 20 persons, passengers and crewmen, died when an Air India plane crashed.
- Dec. 15 Southwestern Venezuela. A chartered air liner carrying 31 persons, including 28 students bound home for the Christmas holidays, crashed, with loss of all aboard.
- Dec. 18 Near Tourane, Viet-Nam. Two French transport planes collided in mid-air, killing 30 persons, of whom most were reported to be French army officers.
- Dec. 19 Near Baguio, Phil. Thirty-seven persons aboard a U.S. air force transport plane were presumed lost in the wreck of that plane, which crashed into Mount Pulog.

### Fires and Explosions

- Jan. 7 Davenport, Ia. Forty-one women, virtually all mental patients, were burned to death when fire destroyed a unit of Mercy hospital; a woman mental patient admitted setting the blaze.
- Jan. 11 Kowloon, Hong Kong. Fire that destroyed thousands of shack dwellings left 20,000 homeless and an uncounted number dead.
- March 8 Albuquerque, N.M. Fourteen military prisoners in a guardhouse at the Sandia Special Weapons base died when a 10-min. fire consumed the building.
- April 13 Atami, Japan. Fire that destroyed 1,500 buildings in this resort town caused damage estimated at \$8,000,000.
- May 1 Patiala, India. Explosion of an ammunition dump in a fort killed 32 persons and injured 40.
- May 6-8 Rimouski, Que., Canada. More than 2,500 persons in a population of 15,000 were left homeless when a \$20,000,000 fire destroyed a large portion of the town.
- May 11 Near Charleroi, Belgium. Thirty-eight persons were killed in the explosion of gas in a coal mine.
- May 19 South Amboy, N.J. At least 29 persons were killed and about 400 were injured when munitions on four barges exploded. The city suffered widespread property damage.
- May 20 Near Rotthausen, Germany. Explosion and fire in a Ruhr coal mine killed or fatally injured at least 75 miners out of 96 who were in the mine.
- June 27 Near Homs, Syria. Sixty persons were killed and 93 injured in an explosion at a fuel depot.
- Sept. 26 Creswell, England. A flash fire 1,000 ft. down in the Creswell coal shaft killed 80 coal miners, as the flames exhausted oxygen and generated poisonous fumes. An additional 120 were rescued.
- Oct. 4 Near Slezská Ostrava, Czechoslovakia. An explosion in a coal mine killed 36 miners.
- Oct. 5 Lota, Concepción province, Chile. Thirty-two coal miners were killed in a gas explosion in a mine that extends from the oceanside out beneath the Pacific.
- Dec. 22 Near Amarillo, Tex. Ten aged persons in a convalescent home were burned to death in a flash fire.

### Marine

- Jan. 12 Thames estuary, England. Sixty-four men died in the sinking of the British submarine "Truculent," after it was rammed by a Swedish oil tanker.
- Feb. 28 Off western Iceland. Twenty-seven members of the 50-man crew of the British tanker "Clam" died when the ship, being towed by a tug to Wales for repairs, parted her towline and broke up on rocks off the Iceland coast.
- April 5 Oporto, Portugal. An estimated 60 persons were missing or dead after a ferry capsized on striking a submerged quay.
- April 20 Near Dairen, Manchuria. The U.S. vessel "California Bear" collided in a fog with a ship registered under the Chinese Communist flag, sinking it with an estimated loss of 70 lives.

- May 1 Near Calcutta, India. Fifty policemen were drowned when three police boats capsized.
- June 19 Red sea, south of Suez. The cargo ship "Indian Enterprise," with a load of explosives, blew up, with only 1 known survivor among the 74 persons aboard.
- July 27 Inland sea of Japan, off Hiroshima prefecture. A live torpedo, caught in the net of a fishing boat, exploded as it was drawn aboard, killing 30 fishermen and injuring 10 others.
- Aug. 25 Off San Francisco, Calif. Navy hospital ship "Benevolence" with about 526 aboard was rammed and sunk by a freighter; 504 persons were rescued.
- Aug. 29 Northwest coast of Ceylon. A reported 500 fishermen were either lost or missing as a result of storms that dispersed a fishing fleet.
- Sept. 16 Off St. Malo, France. A French weather ship sank after striking a drifting World War II mine; 51 persons aboard the ship were lost; 42 were saved.
- Sept. 21 Off Honshu, Japan. Fifty-three crewmen of a Japanese fishing vessel were presumed dead when the ship was lost after radioing for help.
- Nov. 15 Near Orasje, Yugoslavia. Ninety-four persons were drowned when a crowded ferryboat overturned on the Sava river.

### Miscellaneous

- March 24-26 Clarinda, Ia. Fourteen patients in an Iowa state mental hospital died within three days at the climax of a two-month siege of influenza, which claimed a total of 48 lives, mostly among aged patients.
- April 13 Hardwar, India. Thirty persons were trampled to death as an estimated 2,000,000 pilgrims rushed to immerse themselves during a sacred period in the "pool of immortality" on the Ganges river.
- May 21 Cavarzere, Italy. Fifteen children were drowned in the collapse of a footbridge over a canal while a religious procession was crossing it.
- June 6 Northern Sudan. Hundreds of persons were reported dead and thousands more stricken by an epidemic of cerebrospinal meningitis.
- June-September Lucknow and Allahabad, India. Over a period of four months 45 persons, many of them children, were killed by bands of wolves, hyenas and jackals that slipped by night into the homes of residents of these and other cities.
- Sept. 7 New Cumnock, Scotland. Thirteen miners were lost but 116 were rescued after a rain-soaked surface area caved into a coal mine.
- Nov. 24 Poza Rica, eastern Mexico. Twenty-two persons were killed, 60 more were seriously poisoned and more than 200 others were affected by an unidentified poison smog that swept over this oil refinery town.

### Natural

- Jan. 15 Pacific northwest, U.S. At least 30 persons died in the U.S. and 4 more were dead in Canada as a result of violent storms.
- Feb. 11-12 Louisiana, Texas, Arkansas. Tornadoes killed 38 persons, injured 200 others and caused extensive property damage.
- April 2-7 Southern Ecuador. Floods of the Tomebamba river left at least 50 persons dead or missing and caused property damage estimated at \$1,500,000.
- May 9-20 Winnipeg, Man., Canada. About 110,000 persons fled from Winnipeg as the flooding Red river threatened the city; the refugees were given temporary housing in provinces to the east in the greatest flood evacuation in Canadian history. Property damage ran into many millions of dollars.
- May 21 Cuzco, Peru. At least 83 persons died and more than 200 were injured, while an estimated 30,000 were rendered homeless, when this 900-year-old city was rocked by an earthquake.
- June 1 Khorassan province, eastern Iran. Thirty-six persons were drowned and 16 others were missing in floods that washed away 932 houses in an area around Meshed, provincial capital.
- June 9-11 Near Tokyo, Japan. Floods and landslides caused widespread damage, with 30 known dead and 20 missing among 70 railway workers buried in one slide, and hundreds of houses swept away by high waters.
- June 10-16 Darjeeling area, India. Heavy rains caused floods and landslides which resulted in the death of more than 100 persons.
- June 25 North-central West Virginia. Flash floods sent streams over an area nearly 100 mi. wide roaring out of their beds, leaving 33 known dead and property damage of several million dollars.
- July 9-11 Northeastern Colombia. An estimated 150 persons died in a series of violent earthquakes that wrecked numerous mountain villages.
- Aug. 3 El Tocuyo, state of Lara, Venezuela. Severe earth tremors virtually demolished this community of 7,000, causing a reported 100 deaths.
- Aug. 6 Eastern Japan. At least 40 persons were missing in severe floods in Ibanki prefecture. Nineteen were killed, 58 were missing and 106 were injured in all eastern Japan, according to one government survey.
- Aug. 14 Anhwei province, China. Nearly 10,000,000 persons were reported affected by floods of the Hwai river, which had killed a reported 480 persons, damaged or destroyed 890,000 houses and ruined crops on 3,700,000 ac. of farm land.
- Aug. 15-27 Assam province, India. A severe earthquake, followed by lesser tremors and by floods, devastated large areas of northeast India; caused 574 deaths; left possibly 5,000,000 homeless; destroyed crops and other property and threatened permanent damage to agricultural lands and other natural resources.
- Sept. 4 Japan. The worst typhoon in almost 20 years swept Japan's four home islands, leaving, according to various reports, between 200

SCENE OF THE DISASTER which took 34 lives and injured 30 others when a crowded streetcar and a gasoline truck collided and burned in Chicago, Ill., May 25, 1950

- and 250 persons dead, 236 missing, 5,648 injured and tens of thousands homeless.
- Sept. 15 Camiguin Island, off northern Mindanao, Phil. A sudden eruption of the volcano Hibok Hibok left 84 persons dead of burns or suffocation from hot ashes and gases.
- Oct. 14 Rosso, Senegal river basin, French West Africa. Ten thousand persons were reported homeless as the result of floods.
- Oct. 21 Santa river, Peru. Thirty persons were killed, at least 100 were unaccounted for and 28 were injured in a landslide of mud and water that resulted when the Pisococha lagoon collapsed.
- Nov. 25-28 Snowstorms that blanketed the northeastern quarter of the United States caused damage estimated by insurance experts at about \$400,000,000, and resulted directly or indirectly in the deaths of 295 persons; Canadian damage was estimated at \$3,000,000 and deaths at 10.

#### Railway

- Feb. 17 Rockville Centre, N.Y. Thirty-two persons were killed and more than 100 were injured when two Long Island railroad passenger trains collided head-on.
- April 6 Near Tanguá, Brazil. At least 110 persons were reported dead or missing after several cars of a train plunged into the Indios river from a bridge whose foundations were weakened by flood waters.
- May 7 Near Jasidih, Bihar state, India. Eighty-one persons were killed and more than 60 were injured when the Punjab mail train was derailed in a tragedy officially termed sabotage.
- Sept. 6 Near Pantojo, São Paulo state, Brazil. Thirty persons were killed and more than 50 were injured in a train wreck.
- Sept. 12 Coshocton, O. A Pennsylvania railroad passenger train crashed at high speed into the rear of a troop train carrying members of the Pennsylvania national guard en route to camp, with the result that 33 guardsmen were killed and 67 were injured.
- Nov. 21 Near Jasper, Alta., Canada. A total of 21 persons died and about 40 were injured when a troop train and a passenger express collided head-on.
- Nov. 22 Richmond Hill, N.Y. Seventy-eight persons were killed and 203 were injured when an eastbound Long Island railroad express crashed into the rear of a standing Long Island railroad train.

#### Traffic

- Dec. 31-Jan. 2 United States. Traffic accidents accounted for 247 deaths over the New Year's day week end.
- May 25 Chicago, Ill. Thirty-four persons were burned to death when a streetcar collided with a gasoline truck; many of those who died were unable to get out of jammed streetcar doors.
- May 26-30 United States. A total of 571 persons died violently over the Memorial day week end, of whom 347 were victims of traffic accidents during the 102-hr. period considered in computing the holiday toll.

- June 30-July 4 United States. A total of 793 persons died violently over the Independence day week end, of whom 491 died in automobile accidents.
- Sept. 1-4 United States. A total of 389 persons died in traffic accidents over the Labor day week end.
- Nov. 22-23 United States. Ninety-four persons died in traffic accidents between 6 P.M. of the Wednesday preceding Thanksgiving and midnight of Thanksgiving day.
- Dec. 22-25 United States. A total of 545 persons were killed in traffic accidents over the three-day Christmas holiday.

**Disciples of Christ.** Originated in western Pennsylvania in 1809 under the leadership of Thomas and Alexander Campbell, Seceder Presbyterian ministers from Scotland, this Christian movement had in 1950 a total membership in the United States of 1,776,490, and in the world, 1,913,192. The Disciples celebrated their 101st convention at Oklahoma City, Okla., Oct. 9-15, 1950, using the theme "Co-operation and Beyond To Brotherhood in Christ." Registrations reached a total of 7,729 with an estimated attendance of considerably more than 10,000. John A. Tate of Richmond, Va., served as president. His successor, elected for 1951, was Marvin O. Sansbury, minister at the University Christian church, Des Moines, Ia. Eight young men were ordained to the Christian ministry at the International convention and recognition was given to all who had been ordained during the past 12 months.

This was the final year of the Disciples' "Crusade for a Christian World." Efforts toward service and financial goals would be continued into the early months of 1951. A long-range program for the Disciples of Christ was to be launched July 1, 1951, constituting an effort to conserve and stabilize the gains of the "Crusade for a Christian World." New missionaries would continue to be recruited, trained and sent out. Especial attention would be given to work at student centres and to the enlargement of the church school program.

During 1950 the Disciples of Christ were engaged in two major projects looking toward Christian union. One was through the Baptist-Disciple commission in which closer fellowship was being planned with the American Baptists, and the other was participation in the Protestant Conference on Church Union. Rep-

representatives were appointed for the continuation of plans and conferences in this movement.

At the close of the year there were 206 missionaries and 2,439 nationals serving in ten mission fields. These were serving under the United Christian Missionary society, a board of missions and education located in Indianapolis, Ind. A total of approximately \$50,000,000 was received for all purposes including local church support, missions and benevolence. Headquarters: 516 K. of P. Building, Indianapolis, Ind.; Marvin O. Sansbury, president; Gaines M. Cook, executive secretary. (See also CHURCH MEMBERSHIP.) (G. M. Ck.)

**Displaced Persons:** see CHILD WELFARE; DOMINICAN REPUBLIC; IMMIGRATION AND EMIGRATION; REFUGEES.

**District of Columbia:** see WASHINGTON, D.C.

**Divorce:** see MARRIAGE AND DIVORCE.

**Dodecanese:** see GREECE.

**Dog Shows:** see SHOWS.

**Dominica:** see WINDWARD ISLANDS.

**Dominican Republic.** Slightly less than two-thirds of the area of the island of Hispaniola constitutes the Dominican Republic. Its area, 19,129 sq.mi., like that of its neighbour to the west, Haiti, comprises rugged mountains, with fertile valleys, torrential rivers and few level stretches. The population is predominantly Afro-American. Population (est. 1950), 2,400,000; that of the capital, Ciudad Trujillo (known as Santo Domingo from the time of Columbus, whence the name of the nation), about 165,000 (1949), and that of the three leading provincial cities, respectively, 56,000 for Santiago de los Caballeros (1946), 23,000 for San Pedro de Macoris and 16,000 for San Felipe de Puerto Plata. The president in 1950 was Gen. Rafael Leónidas Trujillo y Molina.

**History.**—The foreign demand for sugar, cacao and coffee continued firm throughout 1950. The bulk of Dominican sugar moved to Great Britain as before; most of it had been contracted for by the time the events in Korea sharply stimulated the demand for, and price of, sugar and related products. During the first nine months of 1950, exports aggregated in value \$68,000,000 or \$9,000,000 more than in the same months of 1949, and, in volume, were slightly greater. But domestic commercial movement was somewhat slower than in 1949.

The year 1950 witnessed considerable expansion in public works undertaken as well as the completion of others begun earlier. Almost every part of the republic was linked to the capital by dependable roads. The addition of more than 11,600 ac. under irrigation, through the completion of a large dam, brought to nearly 200,000 ac. the area reclaimed since 1930. Hospitals, schools and other essential buildings were finished in increasing numbers in 1950. Water systems and sewage plants, small electric plants and harbour facilities were completed in a number of places, everywhere stimulating private construction in turn.

No noteworthy unemployment existed during 1950. The immigration of European displaced persons continued on a small scale. The trend of prices was upward, with as yet no appreciable effect on wages. Tax increases sufficed to restrain inflationary consequences of the price trend. The government reduced both domestic and foreign public debt, and built up its cash resources.

The foreign relations of the Dominican Republic were uneventful during 1950. The Dominican government maintained a discreet silence with respect to the Puerto Rican nationalist outbreak, in contrast with leftist demonstrations in Cuba.

(C. ME.)

cluding 1,172 emergency schools), all of which were maintained by the state except 53 semiofficial (state-aided) and 136 private schools. The total number of pupils was 242,545. University education was available at the University of Santo Domingo.

**Finance.**—The monetary unit is the peso, officially pegged at par with the U.S. dollar. There was no external funded debt in 1950. Short- and long-term internal obligations totalled \$23,465,308 on June 30, 1949. Notes in circulation on Oct. 31, 1950, amounted to \$23,880,000; gold reserve \$4,000,000; checking deposits in commercial banks \$35,310,000 (including government deposits); time deposits \$11,730,000.

**Trade and Communications.**—Exports in the year 1949 were valued at \$73,700,000; imports were \$46,000,000. Chief exports were sugar (53%), cacao (12%), coffee (10%) and leaf tobacco (8%). Leading customers were the United Kingdom (42%), the U.S. (28%), Canada (4.2%) and Spain (3.9%). Leading suppliers were the U.S. (75%), the Netherlands Antilles (6%), Canada (5%) and the United Kingdom (4.6%). Almost all the sugar exports went to the United Kingdom. Principal imports included machinery (17%), foodstuffs (12%), cotton textiles (11%) and automobiles and other vehicles (6%).

There were 170 mi. of public railway, all owned and operated by the government. In addition there were about 650 mi. of industrial railway, operated mainly by the sugar companies. In 1949 the mileage of surfaced highway was about 509; that of all roads was about 3,000. In 1948 there were 3,124 automobiles and 2,390 trucks. Domestic air service was supplied in 1950 by Compania Dominicana de Aviacion; international service was supplied by Pan American World Airways, K.L.M., British West Indian Airways, Caribair and a Brazilian line. In 1948 there were 2,408 telephone subscribers and about 20,000 radios.

**Agriculture.**—The country is predominantly agricultural and sugar cane is the most important crop. In the 1949-50 season (September-August) 523,951 short tons of raw and refined sugar were produced; sugar exports amounted to 487,100 short tons in the calendar year 1949. Production of molasses totalled 23,947,420 gal. in 1948. Other important crops were cacao (1949-50: 36,500 short tons), coffee (1948-49: 347,550 bags of 132 lb. each), maize, tobacco, bananas and rice. In 1946 there were 597,000 cattle, 547,000 pigs, 346,000 goats and sheep and 1,988,000 poultry.

**Manufactures.**—Manufacturing is limited chiefly to the processing of agricultural commodities and the production of light consumer goods. On Dec. 31, 1947, there were more than 4,200 industrial establishments representing a total investment of \$98,000,000, of which the sugar industry accounted for more than two-thirds. Important manufacturing enterprises in 1950 included 15 sugar mills, a large chocolate plant, an industrial alcohol plant (completed in 1949), 2 breweries and a cement plant. The cost-of-living index in Ciudad Trujillo, as reported by the International Labour office, stood at 218 in Oct. 1950 (1941=100).

**Mineral Production.**—Activity is limited principally to the exploitation of salt and gypsum deposits and rock quarrying. (J. W. Mw.)

**Donaldson, Jesse M.** (1885— ), U.S. postmaster general, was born on Aug. 17 near Shelbyville, Ill. He studied at the Shelbyville Normal school and in 1908 he became a mail carrier. In succeeding years he held various positions of increasing importance in the postal service, becoming, by 1945, first assistant postmaster general. Traditionally the cabinet position of postmaster general had gone to the political leader of the party in office, but when Postmaster Gen. Robert E. Hannegan resigned in Nov. 1947, Pres. Harry S. Truman appointed Donaldson to the post. Donaldson's policies in 1950 aroused sharp criticism in some quarters, when he sought to stem the department's mounting deficits by stern economy moves, including the reduction of deliveries in residential areas and the reduction (announced Aug. 23) by 16,000 of the post office department pay roll to 517,690 persons.

**Donations and Bequests.** Neither disturbed world affairs nor a continuing inflationary movement appeared to have checked philanthropy in the United States in 1950. Preliminary figures, based on available indexes, led to the conclusion that total philanthropy in 1950 was well above the \$4,109,416,000 estimated for 1948 on the basis of official income tax returns for that year, the most recent for which official tax figures were available.

While the total philanthropy apparently increased in 1950, it must be borne in mind that the value of the dollar dropped and many institutions, particularly educational institutions and hospitals, reported operations hampered by stringent financial conditions.

The yearly study of publicly announced gifts and bequests in eight large cities, made by John Price Jones Company, Inc., showed for 1950 a total of \$399,611,803. In 1949 this total was \$285,451,152. The cities included in the study were Baltimore, Md.; Boston, Mass.; Chicago, Ill.; Los Angeles, Calif.; New

**Education.**—On Dec. 31, 1948, there was a total of 2,576 schools (in-

York, N.Y.; Philadelphia, Pa.; St. Louis, Mo., and Washington, D.C.

Of the total benefactions tabulated in this study, \$266,324,346 was in gifts and \$133,287,457 in bequests. The increase in gifts over 1949 was 10.61% and the increase in bequests was 198.37%. The largest total of gifts and bequests publicly announced was recorded in New York city, with a total of \$270,178,778.

In the eight cities, the total announced giving for organized social work was \$104,455,732. This sum in direct gifts was greater than those in any other classification, although giving to religion, which is not generally publicized, undoubtedly exceeds all other philanthropy. Gifts to education in the eight cities rated second with a total of \$58,495,965.

During the year there was a trend toward federated giving in 60 to 70 cities, where there were community chests, and a single appeal made for both local and national causes. With the creation of the United Defense fund and the Associated Services for the Armed Forces, it was anticipated that a further trend in federated appeals and giving might be noticed in 1951.

(J. P. J.)

**Great Britain.**—The continued high rate of death duties prevented any large bequests and in many cases large estates were broken up in order to pay death duties. In January the prime minister appointed a committee with the following terms of reference: "To consider and report on the changes in the law and practice (except as regards taxation) relating to charitable trusts in England and Wales which would be necessary to enable the maximum benefit to the community to be derived from them."

The lord mayor of London, Sir Frederick Rowland, launched on March 21 a National Thanksgiving fund to express the United Kingdom's gratitude for the gifts of food parcels and bulk food supplies received during and after World War II from the peoples of the British Commonwealth and the United States. The fund would provide accommodation in London for commonwealth and U.S. students. The target for the fund was fixed at £2,000,000 and by Nov. 1 about £720,000 had been donated.

Among the grants to Oxford university was one of £100,000 from the Nuffield foundation for two additional fellowships of Nuffield college. Viscount Nuffield said in July that he would not make any more gifts for some time. It had been estimated that he had given away nearly £30,000,000.

**Canada.**—W. L. Mackenzie King, former prime minister, left about \$750,000. The greater part of his estate was dedicated to public purposes. His home in Ottawa was bequeathed to the Canadian government in the hope that history students would be allowed to use it. The lands and houses at Kingsmere, his country estate, were bequeathed to the government as a public park. The will of Joseph E. Atkinson, publisher of the *Toronto Star*, provided for a charitable trust, the Atkinson Charitable foundation. A sum of \$3,000,000 was passed to the trust from his estate in July 1950. **Drew, George Alexander** (1894— ), Canadian political leader, was born May 7 at Guelph, Ont. He was educated at Guelph Collegiate institute, Upper Canada college and the University of Toronto.

He became leader of the Ontario Conservative party in 1938, member of the Ontario legislature in 1939 and premier of Ontario and minister of education in 1943. On Oct. 2, 1948, he was

chosen leader of the national Progressive Conservative party, and elected to parliament on Dec. 20 of that year.

During the February–June 1950 session of parliament, Drew's efforts to set up a parliamentary committee on defense estimates were rejected. However, he succeeded in getting the public accounts committee to function and repeatedly urged strict parliamentary control of government expenditures. He also moved for a royal commission to effect increased efficiency in government services and substantial reductions in costs, for action on old-age pension legislation, abolition of the means test and the creation of an over-all contributory social security plan.

During the special autumn session of parliament, Drew supported the government's measure for immediate resumption of work by railways and workers, but was against compulsory arbitration. He took the stand that Canada was bound to honour its commitments to United Nations and under the North Atlantic treaty, but expressed dissatisfaction with Canada's unpreparedness. (C. Cy.)

**Drought:** see METEOROLOGY.

**Drug Administration, U.S.** The Federal Security agency's Food and Drug administration brought 83 criminal prosecution actions in the fiscal year 1950 against druggists who sold without prescription drugs labelled with prescription restrictions when they were shipped in interstate commerce, or who refilled prescriptions for dangerous drugs without the authorization of the physician who issued the original order. One of the most extreme cases involved 61 refills of a barbiturate prescription without the physician's knowledge, 3 of them after the patient's death from "barbiturates and alcoholism."

The two most extensive recalls of dangerous drugs in 1950 involved 17,000,000 doses of a sedative tablet and about 15,000,000 doses of an anaesthetic injection, both improperly compounded. In each case, as soon as the manufacturers found that the products were capable of causing injury, they voluntarily recalled shipments that had been distributed throughout the United States and in foreign countries. Eight other lots of dangerous drugs were voluntarily recalled by manufacturers and seven at the urging of the Food and Drug administration.

The search for a "magic cure" still persisted among the gullible, hypochondriacs and sufferers of chronic ailments. Remedies seized in 1950 for false claims of cures for nervous upsets were greatest in number, followed by preparations for stomach disorders, arthritis and rheumatism, skin and scalp afflictions, glandular disturbances and respiratory ailments, and general nostrums. In most cases, the unwarranted claims were made in accompanying literature or by various promotion schemes, rather than on the label itself.

The federal Food, Drug, and Cosmetic act also covers therapeutic devices which frequently are promoted with more blatant claims than those used for modern medicines. Two that brought jail sentences to their promoters in 1950 were a "magic spike" and a "plastic dumbbell," each making false claims of radioactive emanations that would cure "any disease known to mankind."

Among the significant therapeutic agents for which new-drug applications were permitted to become effective in 1950 were cortisone and ACTH (adrenocorticotrophic hormone) for the treatment of arthritic conditions, and the antibiotic terramycin. A large number of the 478 new-drug applications approved were for various antihistamine preparations for symptomatic relief of colds and hay fever and veterinary preparations used in the control of fowl coccidiosis. For each application the criterion

for approval was safety if used as directed in the labelling. Under the law, proof of safety must be established before the new drug is put on the market. Labelling claims of efficacy, if unfounded, are subject to the misbranding provisions of the act after the article enters interstate commerce.

During the fiscal year, 331 batches of drugs composed wholly or partly of insulin and 17,165 batches of antibiotics were certified after passing tests for purity, potency and stability. The antibiotics included under the certification provisions were penicillin (except penicillin G sodium and potassium which were exempted from certification on April 1, 1950), streptomycin, dihydrostreptomycin, aureomycin, chloramphenicol, bacitracin and preparations containing them. Also certified were 4,404 batches of coal-tar colours, representing more than 4,500,000 lb., for use in foods, drugs or cosmetics.

More than 2,100 factory inspections and the examination of 6,728 samples of interstate shipments of drugs and devices resulted in 223 seizures and the institution of 117 criminal prosecutions and 8 injunctions in the federal courts. Examination of 6,928 import shipments resulted in the detention of 2,249 drugs and devices that did not comply with the requirements of the United States. **Dyestuffs.** The augmented industrial activity of all colour-consuming industries during the year 1950 was reflected in a marked step-up in the production and sale of dyes. The rise started in the latter part of 1949 and continued strong throughout 1950. The brief period during which a fairly high proportion of anticipatory buying was current served to deplete inventories of many lines of dyed textiles, which stimulated a demand for dyes to meet consuming industry requirements. The national preparedness program resulted in heavy consumption of certain types of fast dyes for colouring fabrics for the armed services. The necessity of allocating some of the more important raw materials to ensure an adequate supply of these colours was considered, but no actual steps were taken to put it into effect.

The export situation showed a marked falling off in the consumption of U.S. dyes. This was attributed to the increased activity in foreign markets from other dye-exporting countries, and the loss of considerable business in the far east on low-priced tonnage products.

Other aspects of the U.S. dye industry showed little change. Research continued along the lines considered most advantageous to manufacturer, processor and consumer. It brought forth many new and improved products that possessed superior dyeing characteristics and better fastness, including a range of dyes designed specifically to produce the highest possible light fastness on nylon. Research also developed new or simplified application techniques for the coloration of the different hydrophobic and

other types of synthetic fibres being manufactured. Sales of the fast vat colours continued to increase, and through special dyeing methods their use was extended to wool.

The United States tariff commission reported that the U.S. production of all types of dyes in 1949 amounted to 139,389,000 lb., a decrease of 31% or 61,987,000 lb. from 1948. The general decline in demand for most dyes in domestic and foreign markets and increased competition abroad from foreign dye-producers were responsible for this decrease. Sales of all dyes in 1949 totalled 136,244,000 lb. valued at \$142,513,000, compared with 186,782,000 lb. valued at \$163,833,000 in 1948. The unit value of all dyes sold increased to \$1.05 per pound from 88 cents in 1948, because of reduced production of the cheaper dyes. The vat colour group still maintained its leading position in both production and sales and accounted for 32.1% of the 1949 total, an increase of 2.4% over 1948. The direct dyes represented 22%, acid dyes 13% and sulphur dyes 13%.

Production of azo dyes declined by 35%, indigoid and thio-indigoid dyes 44% and sulphur dyes 14%, while anthraquinone vat dyes only declined 824,000 lb. or 3% which was particularly significant. A few dyes increased in output in 1949 compared with 1948. The more important were: sulphur green, 90% higher; sulphur brown, up 35%; vat jade green, 32% higher; and vat olive, up 13%. Production of synthetic indigo was 13,400,000 lb. or 40% less than reported in 1948.

Sales of vat dyes other than indigo were valued at \$40,812,000, direct dyes at \$29,598,000, acid dyes at \$18,983,000 and sulphur colours at \$5,892,000, the latter being exceeded in total value by the acetate, azoic and basic dyes. Figures for 1950 production and sales were not available at the end of the year (A. G. Br.)

**Europe.**—Production of dyestuffs generally continued at a high level in 1950; and shortages, except for occasional delays in the delivery of specific items, had largely become a thing of the past. During the year the Organization for European Economic Cooperation published two reports on exportable surpluses of chemicals in western Europe; from the tables in these it could be seen that ample quantities were available. Producers both in Switzerland and in Great Britain reported keener competition in export markets and severe difficulties in trading with eastern Europe and parts of Asia. On the other hand sales increased in some markets, particularly of the high-quality fast colours.

The directors of the German Badische Anilin A. G. took advantage of the company's 85th anniversary to issue a progress report. This firm had been one of the units of I. G. Farbenindustrie, the chemical combine dissolved by Allied order. Badische once again became an independent company, although managerial functions and administration were in the hands of a French sequestrator. Reconstruction work (war damage was estimated at 400,000,000 reichsmark) was stated to have proceeded slowly; but about 300,000 cu.m. of waste had been disposed of. In spite of these difficulties, Badische re-employed all members of the staff returning from the forces, and about 500 patents were taken out between the end of World War II and the end of 1950.

Perhaps the most talked-of development in the application of dyes during 1950 was the Standfast continuous dyeing machine for vat dyes, in which the impregnation and fixation of the dye-stuff was brought about by passage of the cloth through molten metal of a type that melts at a temperature under the boiling point of water. (L. E. Ms.)

**Ear, Nose and Throat, Diseases of.** **Allergy.**—Solomon Slepian reported that the best results can be obtained when the allergist and otolaryngologist (ear, nose and throat specialist) work together. Scratch tests, 15 to 20 at a time, or more sensitive

intradermal tests are made, a careful history is taken, and treatment is instituted. Offending foods should be avoided, pets discarded, pillows and mattresses covered with nonallergic materials and dust-laden drapes and rugs removed.

Treatment can be started with stock dust or stock vaccines, and if ineffective, then with autogenous vaccines and autogenous dust. Small, carefully graduated doses of all hyposensitizing materials are advisable. Large polyps should be removed surgically; small polyps and polypoid degeneration may clear up under allergy treatment. The antihistamines and nasal decongestants are of value in the acute cases and aid in making the patient comfortable while finding the real offender.

**Deafness in Children.**—The amount of deafness is diagnosed by a combination of methods: (1) careful history; (2) spontaneous response (blinking, jumping, turning and locating); (3) learned or conditioned response (gross sound, voice and audiometer); (4) observations of the child's basic language ability; (5) psychometric evaluation; (6) vestibular function tests; and (7) the galvanic skin resistance method. Donald K. Lewis concluded that of these, the most important are: history, conditioned response and psychometric evaluation.

The treatment consists of: (1) lip reading; (2) special teachers at good centres, with much training by the parents at home; (3) the over-all supervision by an otologist, interested in the work. Each of these is absolutely essential.

**Chemical Burns of the Oral Cavity and Oesophagus.**—At the Sofia clinic in Bulgaria there were 1,221 cases of chemical burns over a period of 20 years (1928-47). Lye was responsible for most of the chemical burns of the oral cavity and oesophagus, or 979 cases, according to a study by Angel V. Stumboff.

The other chemicals causing burns were: hydrochloric acid, 39 cases; nitric acid, 62 cases; sulphuric acid, 107 cases; ammonia, 6 cases; tincture of iodine, 2 cases; phenol (carbolic acid), 1 case; potassium permanganate (potash), 2 cases; kerosene, 1 case; spirits of camphor, 1 case; various mixtures, 13 cases. There were three types of burns caused: first degree, 10%; second degree, 63%; and third degree, 27%. The third degree cases eventually died. The second degree cases needed a great deal of treatment. There were four stages in most cases: (1) oedema and swelling; (2) ulceration; (3) granulation tissue; (4) stricture and fibrous tissue. The strictures may be single at one level or multiple at two or more levels. Later strictures of the oesophagus as a result of corrosion from caustics are most frequently found at the level of the anatomic or physiological narrowings of the oesophagus.

Sometimes there is total narrowing of the oesophagus and retention and regurgitation of all food ingested by mouth. The patient drools, loses weight rapidly, becomes acidotic and dehydrated, and if gastrostomy is not done, death follows as a result of starvation.

During the second and third stages, because of the presence of ulcerations and granulations, oesophagoscopy is not advisable.

The complications of corrosive oesophagitis are numerous: mediastinitis 20%, perforation of the oesophagus 15%, perforation of the stomach 10%, peritonitis 15%, oedema of the larynx 6%, bronchopneumonia 14%, ulceration into the aorta or into the trachea 20%. If the oesophagus is perforated, the patient experiences back pain and has difficulty in breathing, a high temperature and septic symptoms, such as chills, a rapid pulse rate and weakness. After each perforation there is inflammation of the perioesophageal tissue. Mediastinitis is not always fatal. If adequate treatment is used the infection can be cleared. Food or liquids should not be given by mouth, and penicillin and the sulfonamides should be given.

One of the best methods of treatment for stricture of the

oesophagus is the continuous string method. Gastrostomy should be done with due consideration of its type and location for future retrograde bougienage. When the gastrostomy wound has healed, that is, after 15 to 20 days, an attempt is made to have the patient swallow a silk string. The string should not be very long, so that it may not pass down to the intestines. Swallowing water helps the string to go down. After 24 to 48 hours, the free end of the string is fished from the stomach through the gastrostomy opening. A urethral bougie is attached to the string, and by the upper end of the string being pulled, the bougie enters the stricture. To the other end of the bougie another string is attached, which remains outside the gastrostomy opening. The stricture is under constant dilation by the bougie, which stays in the oesophagus for months and years. When the stricture is narrow the patient can be fed through the gastrostomy opening. Later the patient can be fed by mouth. The food passes down either side of the bougie or through its lumen. When food passes with difficulty the patient is instructed to pull the bougie down into the stomach during meals, and after meals he pulls it up again.

For satisfactory dilation bougies no. 28 and 30 are used. Such dilation can be attained in one year or one and a half years, but the desirable period of dilation is two years; six months after that the gastrostomy opening may be closed.

In cases of complete atresia (closing off) in which dilation is impossible, gastrostomy is done and the patient is fed through the gastrostomy opening for the rest of his life. Such patients can live for many years and can return to gainful occupations. In other cases oesophagoplasty is performed. The basis of this operation is the utilization of a cervical skin flap inverted on itself, into tubular form, with the skin inward. In other cases a part of the small intestine is taken and implanted under the skin of the chest; this can satisfactorily substitute for the oesophagus, with peristaltic movements.

**Evaluation of Irradiation of Pharyngeal and Nasopharyngeal Lymphoid Tissue.**—Francis R. Lederer expressed disapproval of the radium application, for children, in the treatment of deafness, asserting that irradiation can better be done with X-ray. Considering all the available evidence, irradiation of the nasopharynx by the standardized techniques is without danger. It should, however, be used with restraint and in technically knowledgeable hands. Its use is not a substitute for surgery and should be confined to those cases of conduction deafness associated with the proven presence of lymphoid hyperplasia, in and about the eustachian tube orifices. The syndrome of transitory hearing loss, allergic reactions and infection in the nose, sinuses or nasopharynx or both, must be recognized and treated accordingly, in addition to irradiation. The importance of history-taking in relation to previous irradiation is stressed because of the possibility that a repeated series of treatments may produce untoward tissue changes. The warning of the danger to the careless technician himself must be respected. The use of irradiation in permanent hearing loss is to be deplored and discouraged.

Even in competent hands, no great advantage is to be had from over-irradiation. As a matter of fact, the simplicity of obtaining and carrying out the first form of therapy may eventually lead to the harm which it is desired to avoid. The increasing prevalence of the routine postoperative irradiation of the nasopharynx is purely an admission on the part of the otolaryngologist that this operation is technically inadequate. Histologically, all stages of degeneration in the lymphoid tissue may be demonstrated following irradiation. This is then followed by varying degrees of reparative change from granulation tissue, to localized areas of ossification in occasional cases. No further metaplastic change was noted nor was there any al-

teration of the surface epithelium.

**Economics.** The Korean war not only dominated the international scene during the last half of 1950, but also exerted a compulsive influence on internal economic developments in the United States. It touched off a consumer buying spree which shot specific prices to unprecedentedly high levels and created considerable scepticism as to whether postwar inflation had after all really spent itself. It appeared that defense and military production would of necessity result in a larger-than-anticipated federal deficit further to strengthen inflationary tendencies. The restoration of controls of materials allocations, new construction, prices and manpower became imminent. The gross national product accelerated to an unprecedented annual rate of nearly \$300,000,000,000 at the year's end. It became clear that serious military preparation would present the very disturbing alternative of guns or butter rather than the comparatively pleasing prospect of guns and less unemployment which the United States faced in 1940; that the necessity of retooling for war or defense would make serious inroads on the standard of living to which the U.S. consumer had grown accustomed. It seemed obvious also that the whole pattern of economic collaboration between the United States and the Marshall plan nations, for the containment of communism, would have to undergo careful re-examination and probably extensive revision.

Economists were forced to direct attention to the mundane considerations suggested by these international developments. Purely domestic issues, such as those related to housing, medical care and agriculture, combined with them to force on the science an institutional, problem, and policy orientation. At the annual December meeting of the American Economic association at Chicago, papers with a problem slant outnumbered those with a theoretical slant by the ratio of approximately five to one. It appeared that theoretical hairsplitting was a job delegated almost completely to the econometrists who themselves were, to some extent, enmeshed in the problem orientation.

Aggregative income-flow analysis held continued sway over economics whether the latter is thought of as a field of investigation or as an academic discipline. Price theorists came to justify their special interest not for its own sake but with the somewhat valid argument that since income flows take place through markets they can be understood thoroughly only if price patterns are themselves understood. Price determination was seen, however, to be less a matter of the resolution of blind market forces and more a matter of arbitrary individual and collusive firm decisions. During the year one prominent economist suggested an entirely new analytical approach starting with an examination of firm and industrial assets and balance sheets. How significant or original this point of view is was not immedi-

ately determinable. The most ambitious book-length treatment yet to appear of the largely conjectural economics of atomic power came off the press at about the end of the year. (G. J. C.)

**Economic Stabilization Agency.** The Economic Stabilization agency was created by Pres. Harry S. Truman's executive order 10161 on Sept. 9, 1950, under authority of the Defense Production Act of 1950, to stabilize the economy through price and wage controls during the period of the economic strain of the rearmament program.

The executive order directed the agency to develop both short- and long-range price and wage stabilization policies and to establish price ceilings and fix wages and salaries where necessary. It set up, under the administrator of the agency, a director of price stabilization and a nine-man Wage Stabilization board, with a chairman to be designated by the president. Three members of the board were to be representative of the public, three members were to speak for business and industry and three members for labour.

In early October President Truman named Alan Valentine president of the University of Rochester, Rochester, N.Y., from 1935 until early 1950, as administrator, and Cyrus S. Ching (*q.v.*) director of the Federal Mediation and Conciliation service, as chairman of the Wage Stabilization board. Shortly thereafter the White House announced appointment of Clark Kerr, director of the Institute of Industrial Relations of the University of California, Berkeley, Calif., and John Dunlop, professor of economics of the graduate school of public administration of Harvard university, as the other public members of the board. The labour members selected were Emil Rieve, president of the Textile Workers union, C.I.O.; Harry C. Bates, president of the Bricklayers, Masons and Plasterers International union, A.F. of L.; and Elmer E. Walker, vice-president of the International Association of Machinists, which was at the time an independent union. The industry members named were J. Ward Keener, of the B. F. Goodrich Company of Akron, O.; Reuben B. Robertson, Jr., of the Champion Paper and Fibre company, Hamilton, O.; and Henry B. Arthur, of Swift and Company, Chicago, Ill.

These appointments were followed by the selection of Michael V. DiSalle (*q.v.*) who was then serving his second term as mayor of Toledo, O., as director of price stabilization.

The first mandatory controls invoked by the Economic Stabilization agency were over the manufacturers' price of new automobiles, which were frozen at Dec. 1 levels until March 1, 1951, to allow the agency time to determine "whether cost increases actually incurred justify price increases in the industry." Several days later, on recommendation of the Wage Stabilization board, Administrator Valentine froze wages in the automobile passenger-car manufacturing industry until March 1, 1951, pointing out that the Defense Production act provided that when ceiling prices had been established the administrator "shall stabilize wages, salaries and other compensation in the industry or business producing the material or performing the service."

After invoking controls over the automobile industry, the ESA announced "voluntary pricing standards" for business and industry generally, requesting nation-wide compliance to avoid the necessity of further mandatory price controls. In general these standards asked business to hold prices to Dec. 1, and set forth various conditions under which it would be permissible to raise prices after that date.

Administrator Valentine also sent telegrams to 250 major business firms, asking them to notify the ESA seven days before announcing any contemplated price increases in large volume items. (W. W. Mc.)

**Ecuador.** A republic on the west coast of South America, Ecuador straddles the equator, after which it was named. It is bounded on the north and east by Colombia; on the south and east by Peru and on the west by the Pacific ocean. Its area, including the Galápagos Islands, a 3,029 sq.mi. dependency, is estimated as 104,510 sq.mi. The population totals 3,404,000 (1949 est. by the United Nations). An estimated 60% of the people are Indians, 30% mixed blood, 9% white and 1% Negroes. Quito (pop., 1947 census 200,185) is the capital; other major cities (with pop. estimates) are Guayaquil, the principal Pacific port (235,000), Cuenca (53,500), Riobamba (28,500), Jipijapa (23,000), Vinces (22,500), Chone (22,300), Ambato (22,300), Loja (21,560). The preponderant religion is Roman Catholic. The president in 1950 was Galo Plaza Lasso.

**History.**—Under the new constitution effected Dec. 31, 1946, the government continued impressive social advances during the year 1950, including the sale and authorized homestead of public lands to citizens, resettlement projects, irrigation developments, the extension of national credit to farmers, the provision and enforcement of compulsory primary education and the compulsory military training of male youths of 19 to 22 years of age.

During 1950 the Lasso government reported a national resources survey indicating that Ecuador held a unique position as a nation best capable of supporting additional population and development. The report showed that known resources were capable of supporting at least three times the 1950 population. About 46,000 sq.mi. of Ecuadorian lands remained subject to homestead, and approximately 10,000 sq.mi. were at public sale. Barely half of the renowned Quito valley, termed the garden lands of the American tropics, had been settled. Comparable areas totalling at least 29,000 sq.mi. included Los Alpes and San Domingo de los Colorado lands, which despite medium altitudes and fertile soils remained virtually unsettled.

(C. M. Wt.)

**Education.**—Primary education is gratuitous and compulsory. In the school year 1948-49 there were 3,029 public primary schools with 208,155 pupils and 396 private schools (mostly Roman Catholic) with 56,116 pupils. There were 57 public secondary schools with 11,321 pupils, 68 private schools with 5,502 pupils and 2 municipal schools with 1,192 pupils. There were four public universities—Quito (2,383 students matriculated), Guayaquil (1,472), Cuenca (541) and Loja (144)—and one private university—the Catholic university of Quito (60 students). Education was scheduled to receive 19% of the 1950 budget.

**Finance.**—The monetary unit is the sucre, valued at \$0.0741 U.S. currency, official rate, and \$0.0517, free rate, on Sept. 15, 1950. The national budget for 1950 balanced revenue and expenditure at 388,000,000 sucres; capital expenditures were budgeted at 138,000,000 sucres. The foreign debt on Dec. 31, 1949, was \$39,306,000; the internal debt was 111,453,000 sucres. Notes in circulation on Sept. 30, 1950, totalled 440,000,000 sucres; gold reserves \$18,700,000; commercial banking deposits 443,000,000 sucres; time deposits 114,000,000 sucres and government deposits 69,000,000 sucres.

**Trade and Communications.**—Foreign trade through the port of Guayaquil in 1949 included exports (excluding gold) valued at 439,000,000 sucres and imports valued at 602,000,000 sucres. Chief exports were cacao (26%), coffee (17%), rice (16%) and bananas (15%). Principal customers were the U.S. (55%), the Philippines (8%) and Italy (8%). Leading suppliers were the U.S. (70%) and the United Kingdom (7%).

The length of the nine nationalized railroad lines in operation in 1949 was 698 mi. Highways (1947) included 1,591 mi. of main roads, and 1,121 mi. of branch roads. In 1948 there were 2,921 automobiles, 4,245 trucks and 945 buses. Air service in 1950 was furnished principally by two Ecuadorian companies—Transandina and Ateca—and by three international lines—Panagra, Avianca and Braniff Airways. On Dec. 31, 1949, there were 50 commercial and 3 cultural radio broadcasting stations.

**Agriculture.**—Ecuador's economy is basically dependent upon its export crops. Production of the principal export crops in the crop year 1949-50 was estimated as follows: cacao 22,000 short tons; coffee 19,300 short tons; rice (1948-49) 119,000 short tons. Other crops included sugar cane, bananas, citrus fruits, castor beans, tobacco and cotton. In 1945 there were about 1,200,000 cattle, 1,443,000 sheep and 346,000 goats.

Important forest exports in 1949 included tagua nuts (9,800 short tons) and balsa wood (2,250 short tons). Other products were hardwood logs and lumber and cinchona bark. Rubber collection was negligible. The 1949 kapok crop was virtually a failure.

**Manufactures.**—The most important manufacturing activity was the textile industry, which produced cotton (principally), woollen, silk and rayon textiles. The manufacture of *toquilla* (Panamá) hats was also important; 3,445,000 units were produced in 1949. Numerous factories produced consumer goods for domestic consumption.

SCHOOL CHILDREN OF AMBATO, ECUADOR, carrying on with improvised equipment in 1950, at the school of the Josephine fathers which was destroyed during the previous year's earthquake

**Mineral Production.**—Production in 1949 included gold 80,982 fine ounces (excluding placer production); silver 277,047 fine ounces; and copper 1,552,550 lb. Production of petroleum, concentrated on the Santa Elena peninsula in Guayas province, was 2,535,233 bbl., of which 915,721 bbl. were exported, the remainder being refined in Ecuador. (J. W. Mw.)

**Education.** The outstanding events in education in the United States during 1950 were (1) the bogging down of the effort to pass federal legislation to equalize educational opportunity in the several states; (2) the growing financial plight of the colleges as income decreased, costs rose, veteran enrolment declined and students were drafted; (3) two decisions by the United States supreme court and judgments by other courts ruling that Negroes could not lawfully be prevented from attending graduate schools in the south, and the consequent admission of Negroes to these institutions; (4) the declaration by educators that they would support with all their resources the prosecution of the Korean war; (5) the continued shortage of elementary school teachers and inadequate school facilities, which served to hamper educational service to the nation; (6) the effort to impose a special loyalty oath upon the faculty of the University of California, Berkeley; (7) the renewed enthusiasm in behalf of international educational co-operation by the United Nations Educational, Scientific and Cultural organization (U.N.E.S.C.O.) after the revoked resignation of Director-General Jaime Torres Bodet; (8) the passing of federal laws to aid students of the sciences and communities lacking sufficient educational facilities to care for the expanded enrolments arising from the influx of war workers; (9) the continuation of international study and travel by large numbers of U.S. and foreign students and faculty members; and (10) the deliberations on child and adolescent psychology and sociology by the Mid-Century White House Conference on Children and Youth.

The office of education of the Federal Security agency released in September the following figures on enrolment in the public and private schools: 23,686,000, elementary; 6,142,000, secondary; 2,700,000, all forms of colleges; and 375,000, private commercial and nurse training institutions. The total for 1950-51 was placed at 32,903,000, with an increase of 920,000 elementary pupils and decrease of 98,000 secondary and 50,000 colleg-

iate students as compared with the previous year. In all, the survey indicated that there was a shortage of 90,000 teachers.

As usual, there were variant statistics on enrolment in higher education. According to the United States office of education, in its report in November, attendance in 1,838 institutions dropped from 2,456,000 in 1945 to 2,295,000 in 1950, a reduction of 6.6%, while the number of veteran students was reduced from 856,000 in 1949 to 575,000 in 1950. The November survey by the *New York Times* indicated a total of 2,344,509 college students, or a 7.4% decline from 1949. The 31st annual census of college students by Raymond Walters, president of the University of Cincinnati, revealed 1,414,000 full-time and 433,759 part-time attendance in 770 accredited institutions, or 1,848,187 in all. These statistics show a decrease of 9.4% in full-time enrolment and a drop of 7.1% in total collegiate attendance (*School and Society*, Dec. 23, 1950). (See also VETERANS' ADMINISTRATION, U.S.)

**Federal Aid.**—Following his customary procedure, Pres. Harry S. Truman pointed up in January in his message on the state of the union, as well as in his economic and budget messages, the urgent need of federal financial aid to improve the educational status of the several states. He also emphasized the values of education during the current crisis in his address in December to the Mid-Century White House Conference on Children and Youth. The first important bill regarding federal aid was introduced on Feb. 6 by Rep. Graham A. Barden of North Carolina. Like its predecessor of the previous year, H.R. 7160 proposed the allocation of \$300,000,000 annually to the states for the exclusive use of the public schools. Again, history seemed to repeat itself, since the new Barden bill aroused bitter sentiment along religious lines. Francis Cardinal Spellman of New York city, feeling that the parochial schools were discriminated against, characterized this bill as "un-American" after Barden had referred to the cardinal in public as a "cruel authoritarian." Fortunately, these exchanges were neither so sharp nor so protracted as in 1949. After consideration, the house of representatives' committee on education and labour voted down the Barden bill, 13-12. Federal aid to parochial schools was opposed by the American Association of School Administrators, the National Council of Chief State School Officers, the National Education association and numerous other educational and nonprofessional groups. Among the bodies which favoured some form of public aid to religious schools was the Lutheran Church-Missouri Synod, which stated in June that it approved federal aid for social services to parochial institutions.

A bill designed to create a department of health, education and security of cabinet status to replace the Federal Security agency was rejected, in spite of President Truman's special request for its passage. In this way, congress sustained its action of 1949. Another bill urged by President Truman, a five-year program of federal support of medical, dental and nursing education, was turned down. Among the laws passed by congress, however, were the provision of money to construct, maintain and operate school buildings in areas where the increase in defense activities required additional educational facilities (Bailey law); the establishment of a national science foundation "to develop and encourage the pursuit of a national policy for the promotion of basic research and education in the sciences" by the award of "scholarships and graduate fellowships in the mathematical, physical, medical, biological, engineering, and other sciences" (public law 507); the tightening of some of the regulations involving the education of veterans (public law 610); the authorization of loans to institutions of higher education for the purpose of constructing housing facilities for students and faculty (public law 475); and the extension of the coverage of the Social Security act to the faculties and other personnel in colleges and universities. Another significant development indi-

cating federal interest in education was the creation of a council of education, a group of 25 educational leaders, to help the commissioner of education formulate policies concerning the program of the United States office of education.

**Elementary and Secondary Education.**—Early in January the *New York Times* reported a nation-wide survey which showed that more than 3,000,000 children in the public schools in the United States were exposed to defective educational programs arising out of inadequate classroom facilities, overcrowded school buildings and ill-trained teachers. Another survey by the *New York Times* in January disclosed that most elementary and high schools did not set aside sufficient time for instruction in current events. A report by the Educational Policies commission of the National Education association, entitled "Education of the Gifted," stressed the need for the earlier recognition and improved education of children of high intelligence. Several investigations of the free time of school children revealed that they spent too much time before television sets with the result that their school work suffered. The introduction of sex education into the curricula of some school systems led to a protest by the Roman Catholic bishops. The Commission on Life Adjustment Education for Youth issued a report suggesting that the high school curriculum be reorganized to satisfy the needs of all types of pupils. A number of school systems and educational organizations devoted much attention to the premature leaving of high school by many pupils. An outgrowth of the international situation was the controversy that raged in many communities about the exhibiting of the United Nations flag along with the United States flag in schools.

**Higher Education.**—The problem of properly financing colleges and universities was carried over from 1949, but it was aggravated by the reduction in enrolment arising out of the graduation of veterans, smaller freshman classes resulting from the draft for the armed forces, and increases in operating costs. As 1950 came to a close, the fiscal plight of higher educational institutions was growing even worse. With the increasing complexity of the international situation, it became evident that college attendance would decline still further. The outlook appeared especially bleak when the Association of American Universities passed a resolution in December in favour of universal military service at the age of 18. Much controversy ensued after an advisory body to the Selective Service system recommended that superior college students be deferred from the draft. There was no doubt that the colleges and universities would need some assistance if they were to continue their service effectively.

There were several developments of interest in the college curriculum. Preprofessional and professional schools paid more attention than previously to the humanities and the social sciences. A crisis in the training of engineers loomed when the American Society for Engineering Education revealed in November that decreased enrolments in technical institutions would result in a serious shortage of qualified engineers. The *New York Times* undertook two nation-wide surveys concerning the teaching of the social sciences in colleges. In April the first survey revealed that 34% of all institutions, about twice as many as in 1942, required U.S. history of all undergraduate students. The second study, issued in December, pointed out that less than 1% of U.S. undergraduate students were enrolled in a course in U.S. geography and that less than 5% of all college students were studying any kind of geography course. Evidence in favour of some kind of internationalist tendency in higher education could be found in the establishment of the Institute of Contemporary Russian Studies at Fordham university, New York city, the Center for Israeli Studies at Columbia university and the Institute for the Study of African Affairs at Lincoln uni-

versity, Pennsylvania.

Other significant events in higher education in the U.S. were as follows: the growth of the newly constituted State University of New York into an over-all institution of 33 units located throughout the state, with a full-time enrolment of 27,253 and a general registration of 34,451; the initiation by 11 western states, together with Alaska and Hawaii, of a program that would control the regional interchange of graduate students in medicine, dentistry and public health; the donation of \$5,250,000 by the Alfred P. Sloan Foundation, Inc., to the Massachusetts Institute of Technology, Cambridge, for the establishment of a new school for industrial management; the matching by the graduate school of business administration, Harvard university, of a \$5,000,000 gift by John D. Rockefeller, Jr.; the resignation of Chancellor Robert Maynard Hutchins (*q.v.*) of The University of Chicago; and the leave of absence taken by Pres. Dwight D. Eisenhower (*q.v.*) of Columbia university to command the combined army of western Europe.

**The Teacher Situation.**—According to a report by Ray C. Maul for the National Commission on Teacher Education and Professional Standards of the National Education association, only 22,460 teachers would graduate from colleges and teacher-training institutions during 1950, whereas the need was for as many as 100,000. Although the number of new teachers in 1950 represented an increase of 15.92% over that for the previous year, the constantly rising elementary school population more than wiped out this gain. The situation in the high schools was different, however; there was a total of 84,730 new instructors available for only 30,000 vacancies.

The purchasing power of the teacher's salary was far below the pre-World War II standard, even though salary increases were prevalent between 1940 and 1950. There were signs of restlessness in many areas. In New York city, the high school teachers refused to conduct extracurricular activities without extra remuneration, a fact which led to a strike and demonstration by thousands of pupils in April in behalf of salary increases for teachers. By the end of the year, however, the teachers had not received any additional compensation.

The question of raising the standards of the teaching profession received much attention during the year. In February the American Association of Colleges for Teacher Education, which was composed of 250 institutions, approved plans for the adoption of nation-wide principles and standards for colleges engaged in the preparation of teachers. These standards would correspond to those in force in the professions of medicine, dentistry and law. Schools failing to meet these standards would not be accredited and might be compelled to close. A court decision which gave promise of encouraging teachers to enrol in summer courses was delivered in May by the United States court of appeals in Richmond, Va. According to the terms of this judgment, a teacher was allowed to deduct from his income tax return "ordinary and necessary expenses" incurred while in attendance at a summer session of a university. The federal judges ruled that such expenses were comparable with those incurred in a trade or business and were not to be regarded as personal.

**Adult Education.**—In spite of widespread activity in behalf of improving facilities for the education of adults, it was evident that a large percentage of the population failed to be reached. In July the Public Library inquiry, which was conducted for three years under the direction of the American Library association, reported that no fewer than 35,000,000 persons lacked public library facilities. As was expected, library service was poorest in rural areas. Toward the end of the year protests began to mount against the policy of some leading radio networks which curtailed the broadcasting of symphonic music.

Again, as in 1949, Paul L. Essert of Teachers college, Columbia university, claimed that 30,000,000 people in the U.S. were benefiting from some form of adult education, an increase of 8,000,000 students in the past 15 years. Exemplifying the efforts to advance the cause of adult education was the intensification by the government of Puerto Rico of its project involving vocational training, community co-operation and precollege studies.

**Race and Religion.**—The most significant occurrence in U.S. higher education in 1950 took place on June 5, when the United States supreme court handed down two unanimous decisions concerning discriminatory practices against Negro students in southern colleges. In the case of *McLaurin v. University of Oklahoma*, the court disapproved the segregation of the Negro graduate student during instruction and other occasions because he was thereby deprived of equal protection of the law under the 14th amendment. According to Chief Justice Frederick M. Vinson, who wrote the opinion for the entire court, the result of setting McLaurin apart from the other students was that he became "handicapped in his pursuit of effective graduate instruction." Moreover, "Such restrictions impair and inhibit his ability to study, to engage in discussions and exchange views with other students, and, in general, to learn his profession." Accordingly, "State-imposed restrictions which produce such inequalities cannot be sustained," and G. W. McLaurin, "having been admitted to a state-supported graduate school, must receive the same treatment at the hands of the state as students of other races."

In the second case, the court ordered the University of Texas, Austin, to admit Heman Marion Sweatt, a Negro, to its law school, in view of the fact that the state law school for Negroes was not equal in any way to the state law school for white students. Again, the court based its action on the equal protection clause of the 14th amendment. After showing that the physical facilities were not comparable, Chief Justice Vinson, who once more expressed the opinion of a united court, pointed out that, even were these equal, the University of Texas law school would still be a more desirable institution for legal study because it "possesses to a far greater degree those qualities which are incapable of objective measurement but which make for greatness in a law school," as, for example, "reputation of the faculty, experience of the administration, position and influence of the alumni, standing in the community, traditions and prestige." Consequently, since such an education was not available in a separate law school for Negroes, Sweatt was authorized to claim his full constitutional right and to obtain "legal education equivalent to that offered by the State to students of other races." Neither decision had any bearing on the larger issue of segregation in the public schools or the "separate but equal" doctrine in general practice throughout the south, since the court emphasized the application of the law to these specific instances. Nevertheless, there was widespread feeling that these decisions were instrumental not only in correcting the situations at the University of Oklahoma and the University of Texas, but also in permitting the enrolment of Negroes in institutions from which they had been formerly excluded. It was clear that the pattern of southern education in the colleges, if not elsewhere, was undergoing an important transformation. Court decisions and other types of local action favourable to the cause of Negro education occurred during 1950 in Delaware, Arkansas, Maryland, Kentucky, Virginia, Missouri and Louisiana.

Not all developments, however, tended to favour the Negroes. A federal suit by Negroes to abolish segregation in the public school system of Atlanta, Ga., evoked a threat to set up a private school system for white pupils. The trustees of the University of Tennessee, Knoxville, rejected in December the applications of five Negro students for entrance into the graduate and law schools, thus defying the two antisegregation decisions

of the United States supreme court. This action was taken despite the advice of the attorney general of Tennessee that the university could not legally deny the applications. The middle district federal court in North Carolina ruled in October that the law school of the North Carolina College at Durham (for Negroes) offered facilities equal to those of the state's law school at the University of North Carolina, Chapel Hill, and that, in consequence, the court would not compel the university to admit four Negro applicants. In this case, it should be noted that the American Bar association accredited the law school of the North Carolina College at Durham after the beginning of the suit, while Dean Erwin Griswold of the Harvard law school testified that it was inferior in every respect to the law school of the University of North Carolina.

The attempt to involve religion with public education yielded a number of incidents which revealed tension among the denominations. In New York state, Catholics, supported by a ruling from the state department of education, opposed vainly an inter-faith baccalaureate service for high school seniors in one local community, but successfully in another. The inhabitants of a very small town in New Mexico, divided over the question of prayer in the classroom, carried their conflict to the state supreme court. Citizens of the Jewish faith in White Plains, N.Y., protested fruitlessly against the presentation of Nativity plays in the public schools.

Many interesting events concerning religion in education transpired during 1950. In October the New Jersey state supreme court sustained the law which required the daily reading without comment of at least five verses from the Old Testament, on the ground that Catholics, Jews and Protestants accept this part of the Bible. In the view of the court, Old Testament readings were religious rather than sectarian. The supreme court of New York state upheld in June the constitutionality of the released time program of religious instruction introduced by the board of education of New York city. According to Justice Anthony J. DiGiovanna, the principle of separation of church and state signified freedom of religion, not freedom from religion. For the third academic year in succession, the New York city board of education retained the ban on the *Nation*, a weekly magazine, from the libraries of the high schools because of alleged anti-Catholic bias in some of its articles. In December the attorney general of New York state ruled that there was no constitutional objection to the use of noninstructional facilities of parochial schools for publicly supported recreational projects open to all children and youth. Also in New York state, the legislature passed a law in March permitting the board of regents to excuse children of Christian Scientists from attending in their high schools any courses in health and hygiene which conflicted with the beliefs of their parents. In June the Lutheran Church-Missouri synod, the second largest Lutheran group in the country, unanimously passed a resolution for the encouragement of religious instruction on released time.

**Communism.**—The imposition of a special non-Communist oath upon the faculty of the University of California by the board of regents caused a controversy which reverberated all over the nation. After considerable debate among the regents and the professors, and between both groups, regarding the question of the abridgment of academic freedom, a compromise was agreed upon. In the meantime, 26 faculty members resigned or were dismissed for refusing to sign the oath, and most of them joined in a suit against the regents in the state court of appeal, but there was no decision as the year closed. On Dec. 16 the regents adopted the requirement of a state loyalty oath, in addition to the university's loyalty statement, of all employees of the university. This state oath made no specific mention of communism.

Support for the position of the faculty of the University of California came from groups of professors at various other universities and from such professional organizations as the American Psychological association, the American Anthropological association and the Modern Language association. On the other hand, an incident at the San Francisco State college received little publicity. At that institution, in November, seven professors and two nonfaculty employees were dismissed for refusing to subscribe to the state's new special loyalty oath.

In New York state the appellate division of the supreme court declared in March that the Feinberg law, which barred Communists from teaching in the public schools, was constitutional. This decision reversed the 1949 opinion of a lower court, which had found that the law conflicted with the due process provisions of both the state and federal constitutions. The board of regents, which was directed by the Feinberg law to draw up a list of subversive organizations, membership in which would constitute grounds for the dismissal of a teacher, had not yet prepared such a compilation by the end of the year. Late in November, after another challenge of the Feinberg law, the court of appeals, the highest tribunal of the state, found unanimously that the legislature did not exceed its constitutional power in passing the law.

Another important event having bearing on the problem of employment of teachers who are members of the Communist party took place in March in New York city when William Jansen, superintendent of schools, suspended eight public school teachers for refusing to say whether they were Communists. These teachers, all of whom were members of Local 555, Teachers union, United Public Workers, were charged with "insubordination and conduct unbecoming a teacher." For the first time in the history of the public school system of New York city the question of fitness of alleged Communists to teach was taken up at a trial. After several weeks of hearings, the special trial examiner recommended in December that all eight teachers should be dismissed for their refusal to answer questions about their alleged party membership. Moreover, he also ruled that the city's counsel had proved that the Communist party advocated the violent overthrow of the United States government and that one of the teachers had been a member of the party and was hence ineligible to teach in the public schools of New York city. The board of education, which was to pass upon these findings, was not expected to act before the middle of Jan. 1951, at the earliest. In the interim, the teachers, whose suspension was thus upheld, had the opportunity of preparing additional arguments.

**International Educational Relations.**—More students of U.S. colleges and universities travelled to Europe during the summer of 1950 than during any preceding year. Estimates of the total varied from 10,000 to 20,000, whereas the number for 1949 was 8,000. In March the Institute of International Education released a publication, *Education for One World*, which contained its annual census of the number of foreign students enrolled in U.S. institutions of higher learning. According to this report, there were 26,433 such students during the academic year of 1949-50 in approximately 1,210 colleges. This total, a decline of 300 from that of 1949, included students from 125 separate geographical units all over the world, with most of them coming from Canada, China, Cuba, India and Mexico, in that order. For the most part, the foreign visitors derived their aid from private sources. However, the United States government, through its Fulbright program, participated in the exchange of students and faculty members with other nations. A group of 114 British and French exchange teachers were brought to the United States in August under the terms of an agreement by the office of education and the English Speaking union.

The fifth annual conference of the United Nations Education-

al, Scientific and Cultural organization (U.N.E.S.C.O.), May 22 to June 17, at Florence, It., proved to be the most turbulent in its history. The major reason for this was the unexpected resignation of Director-General Jaime Torres Bodet because the \$8,200,000 budget was inadequate to tackle the tremendous task facing the organization and because the delegates undertook no action to advance the cause of peace. Subsequently, however, in response to urgent requests by the delegates and promises of more meaningful action, he withdrew his resignation. The critical international situation was also reflected in the dramatic departure of the delegates of Hungary and Czechoslovakia when the conference permitted the delegates from nationalist China to take their places among the other representatives. The actions approved at the U.N.E.S.C.O. conference included a drive against the dissemination of information contributing to intolerance, the endorsement of the director-general's plan for intensified campaigns in behalf of peace, the stepping up of the program of democratic reorientation in Germany, the adoption of Spanish as a working language in all future conferences, and an international agreement to discontinue customs duties on books, artistic and musical compositions, instruments used for scientific research and other cultural implements. During the closing session, the delegates representing the 59 nations resolved to make the program for 1951 a "more direct and important contribution to the cause of peace than the programs of previous years."

Among the other activities of U.N.E.S.C.O. were the following: the inauguration in July of a major world drive to fight the evils of discrimination; an adult education seminar, June and July, at Salzburg, Aus.; a seminar on the teaching of geography, July and August, at Montreal, Que., Can.; a seminar on the role of libraries in adult education, June and July, at Malmö, Swed.; the 13th International Conference on Public Education, with the cosponsorship of the International Bureau of Education, July, at Geneva, Switz.; the condemnation by the executive committee in August of the North Korean aggression and the subsequent effort to re-establish the school system of Korea; the first regional conference of 16 national commissions for U.N.E.S.C.O. in the western hemisphere, in December, at Havana, Cu.; the organization in December of an international association of universities to set up standards for determining the comparative academic status of institutions throughout the world and to facilitate the exchange of faculty members; and the launching of the first phase of the \$2,300,000 technical aid program for underdeveloped areas by helping 13 countries in programs of fundamental education to promote literacy.

**World Trends.**—Reports from Germany indicated that the awareness of that country's constantly growing significance in the international scene helped to harden the Germans' attitudes against efforts at democratic re-education. According to a survey in September, many Germans still believed that national socialism was "a good idea, boldly carried out." Anti-Semitic acts continued to recur. German officials were actually resisting democratic school reforms, according to testimony by the director of the education and cultural relations division, U.S. high commissioner's office, in January.

U.S. authorities in October ordered the dismissal of the large number of nazis who had recovered their teaching posts in Württemberg-Baden.

Positive plans of re-education included the sending of 700 Germans to study in the United States. In the soviet zone, it was clear that the spirit of communism was quickly permeating the entire school system.

Difficulty in reorienting the Japanese was revealed in May when students protested the occupation policy of banning Communist professors. In June, however, the Japanese government

declared itself ready to curb Communist activity in the schools. The second U.S. Education mission, which visited Japan in August and September, reported that the schools were improving along democratic lines.

The success of the programs of indoctrinating the soviet ideology was very much in evidence in such satellite nations as Poland, Hungary, Czechoslovakia and China. In August the Czech government assumed control of all theological schools, introduced throughout 1950 new elementary textbooks reflecting the ideology of the "people's democracy," dismissed professors at the University of Prague for having an "aristocratic spirit," and forced the closing in April of the U.S. information service libraries at Prague and Bratislava. The Hungarians made more use of soviet methods and texts than ever before and, without precedent, appointed a Protestant as minister of religion and education. In China, the ministry of cultural affairs sponsored the translation of soviet literature and the annotation of Chinese classics in the spirit of Marx as interpreted by Lenin, the Chinese People's university at Peking named 35 Russians to special university posts, while in October the government took control of the Catholic Fukien university in Peking and announced that foreign missions would no longer be in charge of their own schools.

The Yugoslav government began in January a campaign to rid the school system of soviet and capitalist ideology. The College of Europe, Bruges, Belg., opened in October with 30 students from 14 nations. This institution aimed to promote the movement for European unity. In Spain, the Falange party discouraged visits to the Casa Americana of the U.S. information service in Barcelona, while in October university students went on strike and protested with little success the government's order equalizing diplomas of Catholic and state technical schools. The question of state aid to Catholic parochial schools was a paramount issue in France and a matter causing concern among British Catholics regarding the survival of their schools. Major strikes, said by newspapers to be Communist-inspired, were organized in May by Mexican students and teachers. In the spring, Egypt approved a plan for free universal education and urged the Arab states to follow suit. A compromise on the religious education of Orthodox children in immigrant camps averted a serious political crisis in Israel. After the religious-bloc ministers boycotted cabinet sessions because of reports that these children were given a nonreligious education, an agreement was reached in February between the Orthodox and the Mapai (Labour) parties that religion was to be taught in the immigrant camps, but under government, rather than rabbinical supervision. (See also BLIND, EDUCATION OF THE; CHILD WELFARE; LAW; LIBRARIES; MOTION PICTURES; NEGROES, AMERICAN. For statistics of institutions see UNIVERSITIES AND COLLEGES; see also under various states and countries.) (W. W. BN.)

**Canada.**—The dominion bureau of statistics reported in 1950 that average annual salary rates for teachers in the publicly controlled schools of eight provinces (Quebec and Newfoundland excepted) showed an average increase of \$243 between 1947 and 1948, or \$835 between 1939 and 1948. In 1944 there were 49,022 teachers in the eight provinces of the survey, of which 20% were men; in 1948 there were 53,572 teachers with 27% men (peak of 30% men in 1940). In 1939, 17% of Canada's teachers were university graduates; in 1948, 19% were.

In Ontario, the Hope royal commission on education, appointed in 1945, made its report in Dec. 1950. Majority findings recommended the establishment of a three-level (elementary, secondary and junior college) public school system, enlarged technical education, more power for local authorities and 300 other improvements. The provincial government of Québec, which in 1946 had assumed the \$110,000,000 debts of 1,014

school boards, had by 1950 paid off \$50,000,000. The government of Nova Scotia established a ministry of education during 1950, and appointed H. D. Hicks as the province's first minister of education. A university of Newfoundland was founded.

The dominion bureau of statistics reported that throughout Canada 70,000 students had enrolled for the 1949-50 university term, a drop of 15,000 from the peak 1947-48 term.

A total of \$7,321,850 was contributed by the federal government to the provinces in the 1949-50 fiscal year for vocational training. Gross enrolment during the year was 22,043, making a total gross enrolment of 940,783 since the inception of the Dominion-Provincial Training act in 1937 to March 31, 1950.

(C. Cy.)

**Great Britain.**—In Nov. 1950 the Burnham committee announced a new agreement whereby the basic rates for qualified male assistant teachers were increased by £75 at both the minimum, £375 (old rate £300), and the maximum, £630 (£555); for unqualified male teachers by £45 at the minimum, £225 (£180), and £75 at the maximum, £375 (£300); and for temporary male teachers by £45 at the minimum, £225 (£180) and £57 at the maximum, £285 (£228). In all grades women, as previously, received 90% of men's salaries at the minimum and 80% at the maximum. The addition to the basic rates for graduate qualification was increased from £30 to £60 for men and from £24 to £48 for women.

In January the first report of the local Government Manpower committee recommended delegation of more responsibility to local authorities and recognized primary duties of the minister of education determining the points at which he must exercise control. The government accepted the committee's recommendations.

The ministry of education's report on 1949, published in June 1950, included sample judgments by inspectors on educational methods and standards in the schools. Infant schools were warmly praised. In primary schools was noted "a slow and slight but widespread change" from formal to more personal methods. Secondary modern schools had "much to offer to the social and spiritual side of their pupils' development" but were less successful in meeting intellectual needs. Some grammar secondary schools were making excellent efforts to reconcile "purely academic training with the broader aims and ideals" of contemporary educational philosophy. Secondary schools had suffered more from war than primary schools; they showed a lowering of standards in formal subjects, "notably science and mathematics, and to some extent in English."

**Education, U.S. Office of:** see EDUCATION; FEDERAL SECURITY AGENCY.

**Eggs.** Eggs in amounts 29% greater than the pre-World War II production rate were included in the food supply of the U.S. in 1950. Production on farms was estimated at 60,000,000,000 eggs for the year; in 1949, 56,382,000,000 eggs were produced, compared with 39,695,000,000 in 1940. Civilian consumption was an estimated 384 eggs per capita, compared with 379 eggs per capita in 1949, and a record of 397 eggs per person in 1945.

The number of potential layers, hens and pullets, on farms on Jan. 1 was 442,000,000 head, compared with 413,000,000 head a year earlier. The average rate of lay per hen for the first 11

months was 156.5 eggs, compared with 154.5 for 1949. The egg-feed price ratio was less favourable than a year earlier.

In Dec. 1950, the average price to farmers was 57.7 cents per dozen, compared with 40.5 cents a year earlier. In spite of the fact that during much of the year prices were lower than in 1949, in November and early December there were radical price increases because of low storage stocks and bad weather which delayed the usual seasonably rapid increase in production and movement to the market. Wholesale prices reached a 30-year high in Chicago of 72 cents for no. 2 Extras; retail prices approximated \$1.00 per dozen, after which supply increased, buyer resistance developed, and prices declined rapidly. The egg price-support level for 1950, at 75% of parity, was a national average farm price of approximately 37 cents per dozen. The method of support was that of purchasing dried eggs; net purchases during Jan. through Oct. 1950 were 81,400,000 lb. valued at \$78,100,000. The Commodity Credit corporation (CCC) inventories at the end of Oct. 1950 included 108,648,358 lb. of dried eggs which cost \$114,986,624. It was announced by the department of agriculture that there would be no such support program in 1951.

Export of eggs in 1949-50, largely of dried eggs, increased sharply to 210,000,000 lb. from 89,000,000 lb. (shell equivalent) in 1948-49. About three-fourths of the 1949-50 total went to the United Kingdom. Storage stocks of shell eggs late in 1950 were the smallest on record, and frozen eggs were near a record low. Dried egg stocks, on the other hand, were very plentiful.

World egg production in 1950 was estimated to have exceeded moderately that of 1949. Feeds were more abundant and flocks were expanded, particularly in Europe. (J. K. R.)

**Egypt.** An independent kingdom of northeast Africa, Egypt is bounded north by the Mediterranean, south by the Anglo-Egyptian Sudan, east by Israel and the Red sea, west by Cyrenaica and the Sahara. Area: 383,000 sq.mi. Pop. (mid-1949 est.): 20,045,000. Language: mainly Arabic (97%). Religion: Moslem (mainly Sunnites) 91.4%; Christian (mainly Copts) 8.19%; Jewish 0.4%. Chief towns (pop., 1947 census): Cairo (cap., 2,100,506); Alexandria (925,081); Port Said (178,432); Tanta (139,965); Mahalla el Kubra (115,509); Suez (108,250); Mansura (102,709). Ruler: King Farouk I; prime ministers in 1950: Hussein Sirry Pasha and (from Jan. 12) Mustafa el Nahas Pasha.

**History.**—The year 1950 began with a general election and a change of government. The chamber of deputies (*maglis el nouab*) had been dissolved on Nov. 7, 1949, and the business of the state, together with the task of preparing for the elections, was entrusted to the caretaker government of Hussein Sirry Pasha. The number of seats in the new chamber was increased, and elections were held on Jan. 3 for 319 seats compared with the previous 260. These were the first elections to be contested by all parties except the Wafd and those of 1945 by the Wafd. The results showed a big swing toward the Wafd. The final state of the parties was revealed as follows: Wafd 225, Saadists 28, Liberals 26, Independents 33, Nationalists 6 and Socialists 1. The Kotla, the dissident Wafdist party of Makram Pasha Ebeid, was left without representation in the chamber.

The caretaker cabinet resigned on Jan. 12, and the retiring prime minister took over a new post as chief of the royal cabinet. Mustafa el Nahas Pasha, as leader of the Wafd, became prime minister, and his cabinet was sworn in on the same day. One of the first acts of the new government was to abolish the press censorship which had been in force since the outbreak of war in Palestine. Martial law was ended on Feb. 5. King Farouk, accompanied by the prime minister, drove through the streets of Cairo to open the Egyptian parliament on Jan. 16. In his

speech from the throne the king reiterated the Egyptian claims to the "unity of the valley of the Nile" and affirmed the country's loyalty to the aims of the United Nations and to those of the Arab peoples. The armed forces, he said, would be reorganized, and attention would be concentrated upon social conditions and employment. Some measures of social insurance would be introduced, and education—primary, secondary and technical—would be free from that day.

On June 17 and 18 royal decrees ordered drastic changes in the composition of the senate (*maglis el chouyoukh*). Hussein Heikel Pasha, its president and a Liberal, was replaced by a Wafdist minister, Zaki Ali el Orabi Pasha; 29 senators were dismissed and replaced by government supporters, while it was announced that the senate would be enlarged from 149 to 179 members. It was officially stated that the dismissed senators owed their deprivation to the illegality of their decree of appointment, but the opposition charged the government with attempting to pack the senate with its supporters, claiming that it feared inquiry into certain alleged scandals connected with army supplies and with operations on the Alexandria cotton exchange. A manifesto signed by the dismissed president and by the leaders of the Saadist, Nationalist and Independent Wafdist groups accused the government of attempting to silence all opposition, to prevent freedom of speech and to set up a virtual dictatorship.

In foreign affairs the past continued to throw long shadows. Differences among member states of the Arab league were blamed for the defeat in Palestine in the king's speech to the new parliament. Later Egypt, a member of the United Nations Security council, refused to support the United Nations action in Korea, although declaredly sympathetic to its objects. This was stated to be in protest against what was described as the failure of the United Nations to take equally effective action against "aggression" in Palestine.

So far as Anglo-Egyptian relations were concerned, the year began with good omens. The British foreign secretary visited Cairo on his way back from the Colombo conference of British Commonwealth foreign ministers in January, and was the guest at a state banquet. King Farouk paid a visit to units of the royal navy at Alexandria, and was himself visited by the duke of Edinburgh. But, as the internal situation deteriorated, the chances of an agreed settlement of Anglo-Egyptian differences appeared to grow more remote, a project for a joint Anglo-Egyptian command in the event of war was rejected and, in the autumn, Egyptian leaders were demanding the immediate evacuation of the British troops from the Suez canal zone and the unconditional unity of Egypt and the Sudan, in terms which emphasized the continued significance of long-standing differences between the two powers. By the end of the year the atmosphere was quieter. The Egyptian foreign minister paid a visit to London, and Egypt was active, with other middle eastern and Asian powers, in attempts to bring about a peaceful settlement of the Korean war. (H. S. D.)

**Education.**—Government schools (1948-49): kindergarten 57, primary 327, pupils 100,000; elementary 5,000, pupils 1,000,000; technical 70, pupils 17,136; commercial 17, pupils 5,481; agricultural 13, pupils 2,725; domestic science 15, pupils 1,763. Nongovernment schools: primary 452; secondary 76. Teachers training colleges 53, pupils 8,382. Universities 3, students 20,259. Other institutions of higher education 8.

**Finance and Banking.**—Budget: (1949-50 actual) revenue £E157,800,000, expenditure £E187,400,000; (1950-51 est.) revenue £E180,900,000, expenditure £E206,000,000. National debt (April 1948) £E125,000,000. Currency circulation (Aug. 1950) £E150,000,000. Gold and foreign exchange (June 1950) U.S. \$673,000,000. Bank deposits (Dec. 1949) £E180,000,000. Monetary unit, Egyptian pound with an exchange rate of £E0.975 to the pound and 0.349 to the U.S. dollar.

**Foreign Trade.**—(1949) Imports £E161,600,000, exports £E137,800,000. Main sources of imports (1949): U.K. 21.5%; Italy 8.5%; U.S. 8.2%; France 5.8%. Main destinations of exports: India 20%; U.K. 18.4%; Italy 7.4%; France 7.3%. Main imports: wheat 9.5%; fertilizers 5.9%; iron and steel products 5.8%; petroleum products 5.8%. Main exports: cotton 75.8%; rice 10.3%.

**Transport and Communications.**—Roads (1947): 8,874 mi. Licensed motor vehicles (Dec. 1949): cars 48,000; commercial 13,600. Egyptian state railways (1949): 5,318 mi. Shipping (July 1949): number of merchant vessels of 100 gross tons and more 57; total tonnage 105,462. Telephones (1947): subscribers 99,814. Radio receiving sets (1949): 183,000.

**Agriculture.**—Main crops (metric tons, 1949): ginned cotton 369,000; maize 1,250,000; wheat 1,167,000; barley 138,000; onions 281,000; sugar, raw value, 210,000; broad beans 321,000. Livestock (March 1947): cattle 1,321,000; sheep 1,875,000; goats 1,474,000; asses 1,125,000; horses 28,000; mules 12,000; camels 197,000; buffaloes 1,240,000; pigs 50,000; chickens 16,312,000. Fisheries (1946): total catch 33,935 metric tons.

**Industry.**—Crude oil production (1949) 2,280,000 metric tons. Raw materials (metric tons, 1949): phosphate rock 350,000; manganese ore 138,000; salt 350,000. Manufactured goods: cotton yarn (1949) 33,720 metric tons; cotton piece goods (1949) 151,000,000 sq.m.; cement (1948) 768,000 metric tons.

**Eisenhower, Dwight D.** (1890— ), U.S. army officer, was born Oct. 14 in Denison, Tex., "David Dwight" but the given name was switched to "Dwight David" during his boyhood. He was graduated from the U.S. Military academy at West Point, N.Y., in 1915. During World War I he served as an instructor, camp commander and commander of tank troops. He was graduated later from the Army War college and the Army Industrial college, served in the office of the chief of staff at Washington, D.C., and in 1935 saw duty in the Philippines as chief of staff to Gen. Douglas MacArthur.

During World War II, he was commanding general of the Allied armies that conquered North Africa and Sicily (1943), invaded Italy (1943), landed in France (1944) and completed the conquest of Germany from the west in 1945. He was made commander of U.S. occupation forces in Germany in 1945 and chief of staff, Nov. 20, 1945, retiring from that post on Feb. 7, 1948, to become president of Columbia university.

In Feb. 1950 Eisenhower warned against the increasing power of the federal government as being a greater peril to freedom than the atomic bomb. On March 23 he said that the U.S. had disarmed itself too rapidly, and later that month he told a senate appropriations subcommittee that U.S. rearmament should concentrate on strengthening Alaska, modernizing all services and emphasizing intelligence work and industrial mobilization. He backed Sen. William Benton (Dem., Conn.) in the latter's proposal for a "Marshall Plan of Ideas" to combat communism, and himself launched the "Crusade for Freedom" movement to enlist private propaganda agencies against communism. On Dec. 19 the North Atlantic Treaty Nations' council and Pres. Harry S. Truman simultaneously announced Eisenhower's appointment as supreme commander of a 12-nation force, to be mobilized for the defense of Europe, and Eisenhower promptly flew to Europe to confer on the rearmament program.

**Elections, U.S.** The Republican party was re-established as a strong and confident opposition in the off-year elections of Nov. 7, 1950, in which the Republicans made substantial gains in the U.S. senate and house of representatives and captured a majority of the governorships. In certain respects, although not numerically, it was a most remarkable and significant comeback since five successive Democratic presidential triumphs seemed to have relegated the Republicans to the role of a permanent minority party.

The G.O.P. scored a net gain of 5 seats in the senate and 30 in the house. The senate alignment for the 82nd session was 49 Democrats and 47 Republicans, as against a 54-42 line-up in the 81st. In the lower body it was 234 Democrats, 199 Republicans, 1 Democrat-Liberal (Franklin D. Roosevelt, Jr.) and 1 Independent, a former Democrat with Republican leanings. In the 81st session it had been 259 Democrats, 169 Republicans, 1 American

WILLIAM BENTON (left) in the helicopter from which he waged part of his successful campaign for election as senator from Connecticut in 1950

Labor party member and 6 vacancies. The G.O.P. captured six governorships from the Democrats, losing none. The resulting line-up at state capitals was 25 Republican governors, 23 Democratic, whereas it had been 29 Democrats and 19 Republicans.

The Republicans picked up senate seats in Pennsylvania, Maryland, Illinois, Utah, Idaho and California, losing one in Missouri. They ousted Democratic governors in Connecticut, Maryland, Nevada, New Mexico, Arizona and Colorado.

However, these numerical increases hardly reflected the extent of Republican recovery, or, to put it more accurately, Democratic losses. Rarely, in a single day of political battle, had so many leaders of a major party been defeated at the polls. Since they supported many of the administration's major policies, the outcome was generally interpreted as a decisive repudiation of Pres. Harry S. Truman's domestic and foreign programs. He refused to accept this interpretation, blaming reverses on "local issues."

In postelection interviews, Republican victors attributed success to such questions as the administration's alleged "coddling of Communists," the collapse of the postwar foreign policy, especially in the far east, the Korean "police action," "socialistic trends" at home, higher taxes and price inflation, based on projected foreign aid and rearmament costs.

The total popular vote was 42,324,232, based on the highest figure in each state, whether cast for governor, senator, representative or a constitutional amendment. It was a record for a nonpresidential year, constituting 61.5% of the estimated eligible voters. The total vote in the house contests was only 40,351,862. The G.O.P. percentage was 49.03, the Democrats' 48.95, and 815,403, or 2.02%, were cast for "other" candidates. The total house vote was 5,019,852 more than the previous off-year record in 1938, the year of Franklin Roosevelt's famous "purge."

Included in the roll of defeated Democrats were Scott W. Lucas of Illinois, former senate majority leader; Francis J.

Myers of Pennsylvania, former senate whip; Millard E. Tydings of Maryland, former chairman of the senate armed services committee; Elbert D. Thomas of Utah, former chairman of the senate labour and public welfare committee; James Roosevelt, who vainly sought the California governorship; Rep. Helen Gahagan Douglas from the same state, who was defeated for the senate; and Chester W. Bowles, loser in his re-election try for governor of Connecticut.

In two prophetic contests earlier in the year, President Truman lost such stalwart supporters as former Sen. Frank P. Graham of North Carolina and Claude Pepper of Florida. They were defeated in the primaries by Willis Smith, former head of the American Bar association, and former Rep. George A. Smathers, respectively, who ran as southern, anti-Truman conservatives.

Eight farm states that figured prominently in the 1948 Democratic triumph returned to Republican allegiance. Although Sen. Robert A. Taft's re-election by more than 430,000 in Ohio was the most spectacular demonstration, many other results indicated that workingmen were again splitting their tickets between the two parties. Negro wards, save in a few instances, showed a sharp decline in Democratic totals.

Events in Korea undoubtedly gave the Republicans an assist in the last few days before the voting. A few weeks before the election, Gen. Douglas MacArthur's Korean victories encouraged the White House. In fact, President Truman made a pre-election trip to Wake Island to consult with MacArthur, a mission assailed by the Republicans as "political." But on the week end before election day, Chinese Communist troops streamed across the Yalu river to check the U.N. advance and to arouse fears that the U.N. "police action" might develop into a bitter winter war, with heavy U.S. casualties, which had totalled about 27,000 before Nov. 7.

Perhaps the most striking Republican victory was Senator Taft's. "Mister Republican," as he was dubbed for his leadership of Republican opposition to President Truman's policies, had incurred organized labour's wrath by his sponsorship of the Taft-Hartley act. Four national labour organizations—the American Federation of Labor, the Congress of Industrial Organizations, the United Mine Workers of America and the Railway brotherhoods—united to defeat him, even supplanting local and national Democratic committees. It was admittedly labour's bid for even more dominant influence at the White House and on Capitol Hill.

Senator Taft carried such industrial centres as Cleveland, Toledo, Akron, Dayton and Youngstown. His remarkable run was interpreted by Republican leaders as a sign that professional labour leaders at Washington could not deliver the workman's vote, that the workers themselves did not regard the Taft-Hartley act as a "slave labour law," which was President Truman's characterization, and that many voters resented labour's growing power in politics.

Sen. Joseph R. McCarthy's charges that fellow travellers had influenced state department policy, especially in the far east, undoubtedly helped the Republicans. Senator Tydings, a congressional veteran of acknowledged ability, was defeated by a lawyer, John Marshall Butler, who was seeking his first public office. The determining issue seemed to be whether or not Senator Tydings, as chairman of a senate committee to investigate the McCarthy indictment, had "whitewashed" the administration, especially Secretary of State Dean Acheson. It was considered significant that Acheson's own Maryland county of Montgomery, although a Democratic stronghold, went Republican by 4,500 votes.

The Communist question was raised in acute form in California. There, former Rep. Richard M. Nixon was opposed for the

"THE MINIATURE MANDATE 'Lo, I am here again, my master—say, What task awaits my giant strength to-day?'" a cartoon by Illingworth published in *Punch* during 1950

U.S. senate by Mrs. Douglas, a supporter of the Fair Deal. She had once voted to abolish the house committee on un-American activities. As a member of that committee, Nixon was concerned with the investigation leading to the perjury conviction of Alger Hiss, on charges that he lied when he told a congressional committee that he had not given official secrets to soviet agents. Nixon, perhaps significantly, was the third member of the house un-American activities committee to reach the senate. The others were Karl E. Mundt and Francis Case, both of South Dakota.

New York, as usual, furnished some surprises. Gov. Thomas E. Dewey, resorting to television interviews in which he answered street-corner questions for a stretch of 18 hours, was re-elected by 564,844 votes. Rep. Franklin D. Roosevelt, Jr., was re-elected to the house, and was immediately mentioned as a 1952 vice-presidential prospect. Vito Marcantonio, the lone American Labor party member of the house, who usually followed the Communist "party line" in his votes, was defeated by a coalition candidate.

Running as an independent, Acting Mayor Vincent Impellitteri smashed Tammany hall, defeating its candidate, former Justice Ferdinand Pecora, who also had President Truman's support, and the Republican candidate, Edward Corsi. Impellitteri was backed by James A. Farley, former Democratic national chairman.

In South Carolina, James F. Byrnes, former senator, supreme court justice and secretary of state, was elected governor without opposition. His break with President Truman, as well as his caustic criticism of the Fair Deal, led to speculation that he might head an anti-Truman movement in 1952, if the president sought renomination.

From the standpoint of loss of political manpower, the Democrats emerged from the election in a bad position. They seemed to have been left with no presidential prospects save President Truman, who would be 68 years and 6 months old in Nov. 1952. Vice-Pres. Alben W. Barkley would be 75 in the same month. Al-

most every senator or governor available for the national ticket in 1952 was defeated in the elections of Nov. 7, 1950.

The Republicans, on the other hand, might be embarrassed by too many claimants of divergent political ideas and ideals. In selecting their 1952 nominee, they might choose from such demonstrated vote-getters as Senator Taft, Gov. Earl Warren of California, Sen. James H. Duff of Pennsylvania, Sen. Everett McKinley Dirksen of Illinois, Governor Dewey and, perhaps, Gen. Dwight D. Eisenhower, a resident of New York.

President Truman had planned to campaign actively, but the Korean struggle led him to cancel these plans. Vice-President Barkley stumped more than 20 states as a White House representative. The president made one avowedly political speech at St. Louis, Mo. He forecast a "smashing Democratic victory," adding that farmers and workingmen who did not vote Democratic should "have their heads examined."

He attributed party reverses to "local issues" entirely, and not to any widespread dissatisfaction with his domestic or foreign policies. He said he would resubmit his Fair Deal to the 82nd congress, opening in Jan. 1951. (See also COMMUNISM; DEMOCRACY; DEMOCRATIC PARTY; REPUBLICAN PARTY; UNITED STATES; and under various states and various countries of the world.)

(R. Tu.)

**Electrical Industries.** Evidence of a speed-up in industrial activity in the United States was seen in the records of the U.S. electrical industry for 1950. Energy produced for the public supply in that year climbed to an estimated 329,028,000,000 kw.hr., an increase of 13% over the 291,099,000,000 kw.hr. generated in 1949, and the largest increase ever recorded in the industry's history. This increase of 37,924,000,000 kw.hr. may be compared with the previous year's increase of 8,401,000,000 kw.hr. To generate this output in 1950, the average kilowatt of hydro capacity produced at name plate rating for 64.5 hr. out of every 100, surpassing any year on record. Fuel capacity produced at name plate rating for about 55 hr. out of every 100.

Fuel-burning power plants furnished 32,245,000,000 kw.hr. of the total increase of 37,924,000,000 kw.hr., raising the proportion of fuel power generation from 69% in 1949 to 71% in 1950, the hydro plant share in output thus dropping from 31% to 29%. In the 12 months ended Oct. 31, 1950, the consumption of coal, oil and gas was 137,610,000 tons of coal equivalent, as compared with 127,060,000 tons of coal equivalent consumed in 1949. Actual coal consumption in the 12 months ended Oct. 31, 1950, was 87,940,000 tons, as against 83,960,000 in 1949. Consumption of oil in the same 12-month period rose to 78,100,000 bbl. from 66,300,000 bbl. in 1949, while use of gas increased from 550,120,000,000 cu.ft. in 1949 to 622,570,000,000 cu.ft. in 1950.

Of the total output in 1950, private power companies generated 81.3% as against 80.3% in 1949, with plants owned by Rural Electrification administration co-operatives, municipal utilities, public utility districts, state projects and the federal government providing the remainder.

**Power Plant Capacity.**—The net increase in generating capacity in 1950 up to Nov. 1 was 4,409,000 kw., bringing the total as of that date to 67,509,000 kw. The actual increase in 1950 was somewhat more than this, with some new capacity scheduled for operation in November and December. The reported new capacity installed in 1950, not all representing net increase, was 5,785,814 kw. Preliminary figures set the noncoincident peak load at about 62,000,000 kw. and indicated that reserve capacity would be about 9% or about 3% less than the 1949 reserve.

Ratios of fuel and hydro generating capacity remained little changed in 1950 from 1949. In the earlier year, fuel power was

**PHOTOTRANSISTOR** (right), a highly simplified type of photoelectric cell which performs most functions of the ordinary vacuum tube (note relative size compared with paper clip). Invented at the Bell Telephone laboratories, New York city, it was in the experimental stage in 1950

73.5% and water power 26.5% of the total; in 1950 the ratios were 74% and 26%. In 1950, power companies owned 79.8% of the generating capacity as against 79.9% in 1949. Ownership of the remaining capacity was divided among REA co-operatives, municipal utilities, public utility districts, state projects and the federal government.

**Electricity Sales.**—Electric utility customers bought an estimated 278,800,000,000 kw.hr. of energy in 1950, an increase of 30,258,000,000 kw.hr. over 1949. This increase was almost four times as large as the increase in 1949 over 1948—7,802,000,000 kw.hr. Industrial usage was responsible for more than 58% of the increase in 1950. In 1949, large industrial customers bought 120,766,000,000 kw.hr., but in 1950 their usage climbed to 138,350,000,000 kw.hr. This increase in industrial usage reversed the situation existing in 1949, when industrials bought 3,322,000,000 kw.hr. less than in 1948.

Sales to residential and rural customers continued to increase. In 1950, sales to these customers were 73,900,000,000 kw.hr., almost 8,400,000,000 kw.hr. more than sales in 1949, which, in turn, were 8,218,000,000 kw.hr. more than in 1948. The average annual residential use of electricity rose from 1,684 kw.hr. in 1949 to 1,825 kw.hr. in 1950, an increase of 141 kw.hr.

**Revenues.**—Customers paid the electric utilities \$5,040,000,000 in 1950, about \$426,000,000 more than in 1949, a 9.2% increase. This was associated with a 12.2% increase in sales and reflected a greater usage of energy at lower steps in rate, mostly because of the increased industrial usage. The average revenue from all customers in 1950 dropped to 1.81 cents per kilowatt hour from 1.85 cents per kilowatt hour in 1949.

Residential customers continued to enjoy a decrease in the unit price they paid for electrical energy, 2.88 cents in 1950, as against 2.95 cents in 1949 and 3.01 cents in 1948. Because of their greater use of electricity, these customers paid an average annual bill of \$52.60, \$1.92 more than in 1949. The 1950 increase of 141 kw.hr. in usage cost the average customer only 1.36 cents per kilowatt hour.

**Users.**—The number of customers served in 1950 grew to a total of 45,122,800, an increase of about 2,272,000 over 1949. The largest increase was again in the residential class, which

added 2,050,019 new customers for a total of 39,229,800. Industrial and commercial customers increased moderately from 5,522,893 in 1949 to about 5,735,000 in 1950.

The number of people in homes served by electricity in 1950 was about 141,500,000 or approximately 94% of the total population.

**Financial.**—Securities issued by electric companies in 1950 approached the record amount sold in 1949. New capital entering the business in 1950 was \$1,300,000,000 as compared with \$1,445,000,000 in 1949. Refunding operations rose to \$408,000,000 in 1950, an increase of \$60,000,000 over 1949. The total financing in 1950 was thus \$1,708,000,000, or \$85,000,000 less than in 1949.

The share of the revenue dollar available for dividends and surplus decreased in 1950 because of increased operating expenses and higher taxes. In 1949 the proportion was 18.1 cents; in 1950 it was 17.8 cents. The gross operating revenue of power companies rose from \$4,113,000,000 in 1949 to \$4,475,000,000 in 1950. Money left for net income in 1950 was \$820,000,000, which amount was \$55,000,000 greater than the net income reported in 1949.

**Electrical Manufacturing.**—In 1950, the federal reserve board estimated index of general industrial production was set at 212, 19 points above 1949 and 1 point above 1948, the record postwar year. The electrical manufacturing industry production index climbed to 493, 64 points above 1949 and 16 points above 1948. Appliances for domestic use broke the 1948 record high of 1,040 by going to 1,156 in 1950, 275 points above 1949. The electrical material index rose from 310 in 1949 to 399 in 1950, 60 points above 1948. Following a drop to 373 in 1949, electrical goods for industrial installation went to 469, only 13 points below 1948. Apparatus for electricity supply systems continued to decline, dropping from 374 in 1949 to 352 in 1950. (See also PUBLIC UTILITIES; RURAL ELECTRIFICATION; TENNESSEE VALLEY AUTHORITY.) (F. J. K.)

**Canada.**—The 1950 annual survey of the water-power division of the federal department of resources and development said that by the end of 1949 21% of Canada's recorded water-power resources were developing 11,613,333 h.p.

During the year 1950 a 200,000-h.p., \$30,000,000 hydroelectric development on the Péribonka river in Quebec was authorized. Canada and the U.S. signed a Niagara river water diversion treaty, Canada handed over to the province of Ontario the Canadian water rights and Ontario began construction of plants to produce 900,000 h.p. of new energy. The Saskatchewan provincial power corporation increased its output 22% in the first seven months of 1950, and the power commission of British Columbia raised production to 157,946,075 kw.hr. for the year ending March 31, 1950, an increase of 28,481,797 kw.hr. over the previous year.

The output of electrical apparatus was greater in 1950 than at the height of World War II. The Canadian electrical manufacturers association urged the federal government to halt further tariff reductions on imports of electrical apparatus (reduced by between 10% and 33½% at the 1949 Geneva agreements).

(C. Cy.)

**Europe.—Generating Plant.**—The second British Electrical Power convention held at Harrogate, Yorkshire, in June 1950 had as its main theme power-station design and operation. The largest size of generating unit in Great Britain was 100 megawatts. To hasten power-station construction the British Electricity authority encouraged the production of boiler plant and ancillary equipment by manufacturers who did not formerly undertake it. Advances were being made by the design, on nonstandard lines, of some of the authority's new stations, turbine conditions of 1,500 lb. per square inch, and 1,050° F. being adopted as well

as hydrogen cooling for the alternators.

Attention was given to the possibilities of feeding power into the public supply network from relatively small generating sets driven by industrial process steam and by other less conventional means. One of these sets, actually installed, had a 1,390-kw. induction generator and was operated in conjunction with a water-gas producer at Beckton gas works. Another unusual type of alternator, being built in sizes up to 150 kilovolt-amperes, had a construction similar to that of an induction motor but had an amplifying exciter giving close voltage regulation without the use of a voltage regulator. It could also withstand accidental short circuits or out-of-phase synchronizing.

**Transmission and Distribution Equipment.**—The construction of the British supergrid, at 275 kv., on which a start had been made, focused attention by manufacturers on circuit breakers, transformers and other transmission equipment for use up to 300 kv. It became clear that air-blast switchgear was likely to be satisfactory for very high voltages and high breaking capacities and several new designs emerged. At the d'Harcourt substation of Electricité de France 220-kv. Alsthom breakers with a rupturing capacity of 350 megavolt-amperes were installed. Another type built by Brown Boveri of Baden, Switz., was to be supplied to Sweden for the new 380-kv. system. This three-phase breaker had a rupturing capacity of 8,600 megavolt-amperes at a maximum of 400 kv. Designs for air-blast circuit breakers by British manufacturers also covered the range of voltages up to 400 kv. with rupturing capacities up to 10,000 megavolt-amperes while oil circuit breakers with similar performance characteristics were also built and tested.

Details were given during the year of the Fontenay testing station inaugurated in 1949 by Electricité de France. This was the only direct short-circuit testing station in Europe and the tests were carried out there in direct connection with the French 220-kv. system. This had the advantage of making a large amount of testing energy available without the expense of providing high-capacity alternators and transformers for a self-contained testing station. For switchgear testing the maximum symmetrical three-phase short-circuit power was 2,800 megavolt-amperes at 220 kv. but arrangements were being made for 3,900 megavolt-amperes to be available and also for 400-kv. tests.

**Utilization.**—In Great Britain fluorescent lighting for streets and public places made headway and costs of about £3,300 a mile were quoted for street lighting with concrete poles and complying with the requirements of ministry of transport group A standards. Fluorescent lamps having tungsten filament ballast lamps as a resistance to avoid using an expensive choke were introduced. Another new lamp with an average efficiency of 45 lumens per watt was a 1,000-w. mercury-vapour lamp for use in spacious and lofty buildings.

**Research and New Developments.**—Research and development work on new sources of energy was described at the World Power conference held in London in July 1950. This included research on wind power for large scale generation of electric power, fed directly into supply networks, which was proceeding in Great Britain, France, Denmark, the Netherlands, western Germany and Italy and for which an international co-operative research and development group was established by the Organization for European Economic Cooperation early in the year. Other developments concerned heat pumps, the industrial utilization of the temperature differences between water at the top and bottom of the sea (a French scheme) and the generation of power from volcanic sources at Lardarello, It. A new generating station under construction at Lardarello was to have four sets each of 26 megawatts.

**Trade.**—The value of all electrical goods exported from Great Britain attained a monthly average of about £11,000,000. As an

example, in September, a rather poor month, the total was £10,159,538 which compares with £10,953,792 and £8,738,944 for the same month in 1949 and 1948 respectively. Imports rose from £290,069 in Sept. 1948 to £497,482 in 1950. (E. W. G.)

**Electric Transportation.** Developments of the year 1950 demonstrated again the predominant position occupied by electric transportation service in cities of more than 500,000 population in the United States. Of the total volume of riding on public transportation lines in these cities, about 65% continued to be handled by electric vehicles and about 35% by motorbuses. This proportion had undergone no marked change in recent years. Three distinctly different types of electric transportation facilities were utilized to render the service: (1) subway and elevated rapid transit lines, (2) electric surface railways and (3) electric trolley coach lines.

**Subway and Elevated Rapid Transit.**—At the beginning of the year the rapid transit lines in New York, N.Y., Chicago, Ill., Philadelphia, Pa., Cleveland, O., and Boston, Mass., were carrying a combined total of about 2,300,000,000 passengers a year. To do this they operated approximately 10,000 cars on 1,250 mi. of track. Chicago, with the delivery of 130 new subway cars, was the only city to add to its rolling stock in 1950. No substantial change occurred in trackage. A slight decline took place in the number of passengers carried, but, statistically speaking, the rapid transit situation remained about the same as it had for the past ten years except for a period of increased riding during World War II.

A trend was in evidence to eliminate gradually the remaining elevated railway lines and replace them by subway lines. Steps to this end were taken in New York and Boston. Extension and improvement was made in the rapid transit facilities serving the east Boston area. As part of this program the Metropoli-

INTERIOR of a ten-car subway train placed in service in New York city in 1950; two lines of fluorescent tubing furnished continuous lighting, and all air in the car was sterilized and cleaned electrically

tan Transit authority ordered 40 new cars of modern design to replace the vehicles that had been in service on this route for many years. A trend toward the use of lighter weight and higher speed equipment was indicated by both the Boston and the Chicago car orders.

New rapid transit facilities were planned at Cleveland where the city was awaiting a loan of \$22,000,000 for this purpose. In the interest of civil defense and municipal economy, New York city's plans for rapid transit expansion were somewhat curtailed. It had been planned to start work early in 1951 on a new subway line along Second Ave. to replace the former elevated railway service on that street and the existing service on Third Ave., and to purchase 350 new subway cars. It was anticipated that these improvements would ultimately be carried out, but the date when they would be undertaken had not been set.

**Electric Surface Railways.**—At the beginning of 1950 the transit industry in the United States had approximately 15,500 electric surface railway cars and about 10,700 mi. of track. Approximately 75% of the vehicles were in cities of more than 500,000 population, but only 36% of the trackage was located in those cities. This difference was accounted for by the existence of many long suburban and interurban electric lines operating only a small number of vehicles. The business handled by these lines in the larger cities amounted to about 3,500,000,000 passengers per annum. Riding declined moderately during the year. This was in part because of the general decline in urban transit business, and in part because of the replacement of surface electric railway service by electric trolley coach service and motorbus service. Fifty new cars were ordered during the year. When they were delivered there would be a total of 4,304 modern cars of the so-called Presidents' Conference committee type in operation in the United States.

Continuing purchases of cars of this type was evidence of the industry's belief in the future of electric surface-rail lines in large cities. While local conditions are the determining factor in selecting the type of service for any particular location, it may be said in a general way that where the peak travel amounts to more than 15,000 people per hour a rapid transit line is probably justified, and where it is between 4,000 and 15,000 the Presidents' Conference committee type car is likely to best serve the purpose. For traffic densities below that which will support rail service, the electric trolley coach furnishes the most efficient type of service except where the traffic is too light to justify the investment in electric facilities.

**Electric Trolley Coaches.**—Expansion of electric trolley coach operations was one of the outstanding features of the year. This was a continuation at a high level of a trend that had been in evidence for some time. Orders were placed for a total of 820 of these vehicles, but only a part of them were built and delivered within the year. From about 6,300 at the beginning of the year, the number of trolley coaches increased to nearly 6,800 in 67 cities in the U.S.

An order for 349, announced by the Chicago Transit authority in September, was the largest single order ever placed for electric trolley coaches. When these vehicles were delivered Chicago would have a total of 710 trolley coaches, making the CTA the leading operator in the country. Next in size was Atlanta, Ga., with 453. At Boston the Metropolitan Transit authority ordered 90 new trolley coaches to bring its total to 430, making it the third largest operator of these vehicles.

At the beginning of 1950 trolley coaches in the United States were carrying passengers at a rate of about 1,700,000,000 annually. By the end of the year this had increased to about 2,200,000,000. With the large increase in trolley bus operations

planned for 1951 this type of service appeared likely to surpass rapid transit in volume of riding.

Although there was wide use of these vehicles in the larger cities, the greatest development occurred in the cities ranging from 250,000 to 500,000 population. In the main, trolley coach service was being operated as a substitute for electric surface railway service, but in numerous instances, because of its economy, it had taken the place of the motorbus on lines of medium heavy travel.

**Heavy Electric Traction.**—No substantial change occurred during 1950 in the scope of electrified trunk-line railroad operation. At the close of the year two 5,000-h.p., 12,000-v. A.C. straight electric locomotives were in production for the Pennsylvania railroad. The use of electric braking would be an innovation in the United States for this type of locomotive.

To add to its fleet of electric locomotives the Chicago, Milwaukee, St. Paul and Pacific railroad purchased 12 units originally built for export to the U.S.S.R. but never shipped. These were designed to develop 5,110 continuous horsepower and were the largest single-cab 3,000-v. D.C. locomotives ever built in the United States. (J. A. Mr.)

**Canada.**—Trolley-bus transportation continued to increase in popularity with management and public. By the end of 1950 Vancouver streetcars were confined almost solely to downtown areas; Winnipeg added 30 new trolley buses, which meant that 26% of the customers were riding on trolley buses, 42% on electric streetcars, and 32% on motorbuses; Hamilton, Ont., introduced trolley buses; in Toronto, however, where 85 trolley buses were in use, transportation officials continued to believe that streetcars were preferable for handling rush-hour traffic; Cornwall, Ont., removed all streetcar tracks since the city was served chiefly by trolley buses; Montreal purchased 40 new trolley buses and extended the trolley-bus network set up in 1949; Ottawa announced that trolley buses would ultimately replace streetcars on downtown streets.

Construction of Toronto's electric subway system continued during the year. Nelson, B.C., and St. Catharines, Niagara Falls and Sudbury, Ont., gave up streetcars in preference to motorbuses. The Quebec provincial government passed a special act creating a Montreal transportation commission to solve Montreal's transit problems, including consideration of a subway.

Electric transportation statistics for Canada for the first seven months of 1950 (compared with same 1949 period) were as follows: urban revenues \$62,922,398 (\$57,803,981); interurban revenues \$24,533,159 (\$24,980,482); urban electric-car mileage 49,320,671 (55,208,844); urban trolley-bus mileage 15,214,096 (10,624,867); interurban electric-car mileage 3,379,083 (3,624,885). (C. Cy.)

**Great Britain.**—Work on the 1,500-v. D.C. electrification of the Manchester-Sheffield-Wath line proceeded. Of the 25- to 50-cycle conversion-schemes, those for the Liverpool-Southport and Euston-Watford lines were completed, and authority was given for a similar change-over on the Southern region's lines in the London area. Traffic on the newly electrified Liverpool Street-Shenfield (Eastern region) line continued to increase.

In 1950 there were only 6,000 modern streetcars still in use in Great Britain, compared with 15,000 in 1927. Trolley buses, despite the lack of generating plant, the coal shortage and the competition of the diesel bus, numbered 5,000.

**Austria.**—On the north-south route from the German frontier at Salzburg to the Italian frontier at Tarvisio (134 mi.) the section between Spittal-Millstätter See and Villach (23 mi.) was electrified in May 1950, leaving only the portion from Villach to Tarvisio (17 mi.) to be electrified. On the 527-mi. east-west route from Hegyesháalom on the Hungarian frontier to Bregenz on Lake Constance electric working was in operation

from Linz to Bregenz; the section Linz-Vienna (117 mi.) was under conversion. The first batch of postwar electric locomotives manufactured by the Wiener Lokomotivfabrik, and electrical equipment by Elin Aktiengesellschaft für Elektrische Industrie were delivered early in 1950.

**France.**—In Oct. 1950 the Paris-Laroche section of the Paris-Lyon main line was opened for electric traction. As regular electrical operation on the Laroche-Dijon section had begun in March, electric locomotives were now hauling all classes of traffic between Paris and Dijon (197 route miles). It was hoped to complete the conversion to Lyon in two years. Altogether 1,125 route miles were planned for electric operation, saving a further 1,600,000 tons of coal a year in addition to the 1,300,000 tons already saved by electrification.

The first of 35 new 2-Do-2 locomotives for fast passenger and freight work on the Paris-Lyon line was delivered. The four traction motors gave a total one-hour rating of 4,880 h.p. or a continuous rating of 4,400 h.p. at 1,350 v. The locomotives could haul trains of 880 tons on the level at 86 m.p.h., or 980 tons on a 1-in-200 gradient at 60 m.p.h.

Work progressed on the experimental supplying of 50-cycle single-phase traction between Aix-les-Bains and La Roche-sur-Foron (48 mi.). The temporary feeding point at Annecy for the trials comprised two Scott-type 45,000/20,000-v. three-phase to two-phase transformers connected so that one output-phase feeds the section to the north and the other the section to the south of Annecy.

**Germany.**—During May the main line Nuernberg-Regensburg (62½ mi.) was converted to electric traction, linking up with the 15-kv., 16⅔-cycle single-phase electrification in that area. Preliminary work was then begun on other Bavarian lines, notably the 119 route miles between Nuernberg, Würzburg and Aschaffenburg with a possible extension of 29 route miles to Frankfurt. In addition, first steps were taken to convert the double-track main line Mannheim-Basle (166 route miles). A large thermal power station was being built in the Bavarian alps near Penzberg with an ultimate annual output of 200,000,000 kw.hr.

A close investigation of the economics of electrification was carried out by the Marshall aid authorities. The German authorities claimed that electrification would reduce working costs and were eager to convert a number of lines in the Ruhr and Rhineland, linking up with the electrification in southern Germany. Under the "Arnold plan," 600 to 800 route miles were to be converted in eight years, including the electrification of the two main lines parallel to the Rhine and other important north-south lines. The U.S. view was that the electrification should be postponed for at least five years, and an Economic Cooperation administration allocation of 58,000,000 deutschemark to the German Federal railways was cancelled.

**Italy.**—Electrification on the Rome-Avezzano line (67 mi.) was extended for 40.75 mi. to Sulmona during May, covering the most difficult part of the 149-mi. single-track Rome-Pescara main line. Further funds were being sought to complete the Rome underground railway begun 12 years previously to link the Central station with the southern suburbs and Ostia. The increasing demand for electric power for traction was being met by the development of two new hydroelectric power stations on the Tanaro, south of Turin and by the enlargement of those near Bressanone on the Brennero line; and also by building two thermoelectric stations in Sicily for the electrification of the Messina-Palermo line under construction.

**Portugal.**—A 1,120-h.p. mixed-traffic locomotive and seven multiple-unit coaches were built in Great Britain for the 5 ft. 6 in. gauge, 1,500-v. D.C. overhead electrified line from Lisbon to Cascais (16 mi.), to haul passenger trains of 240 tons at 50 m.p.h. or freight trains of 600 tons at 30 m.p.h.

**Sweden.**—As it was difficult to accommodate high-voltage single-phase A.C. equipment in small rail cars it was the practice in Sweden to use diesel rail cars for light passenger services on branch lines. But by 1950 a diesel rail car converted to electric working, with 45 seats and weighing 16 tons, was capable of hauling a trailer and, when working independently, had an acceleration of 1.6 m.p.h. and a normal running speed of 55 m.p.h.

Rolling stock for the Stockholm underground (650 v., third rail) was under construction. All cars were to be motored and an average speed of 20 m.p.h. maintained, including 15-sec. station stops, 0.4 mi. apart. Electric equipment of Westinghouse design for the first 200 cars was to be manufactured by the Swedish Allmänna Svenska Elektriska Aktiebolaget company.

**Switzerland.**—The short and steeply graded metre-gauge line between Le Locle and Les Brenets (Neuchâtel canton) was electrified (3 mi. with gradients of 1 in 33). Electric services were also begun in May on the private metre-gauge line between La Chaux-de-Fonds and Ponts-de-Martel (17 mi.).

After World War II the Swiss Federal railways devoted considerable attention to light-weight electric locomotives. Bo-Bo locomotives of the Re 4/4 class delivered during 1950 had an adhesive weight of 57.5 tons, a total one-hour rating of 2,500 h.p. and a maximum speed of 77.5 m.p.h. and could haul trains up to 450 tons. By the use of light-weight electric locomotives and motors the Swiss Federal railways increased scheduled speeds to a remarkable extent.

During the summer 18 daily runs were scheduled at speeds of 60 to 69 m.p.h. from start to stop.

**South Africa.**—Progress toward the entire electrification of the inner Reef area advanced with the completion of the equipment at the change-over point between steam and electric traction at Welverdiend, the western terminus of the Witwatersrand electrified system. The extension to Welverdiend involved the electrification of the lines between Nancefield, Midway and Bank stations and between Randfontein and Welverdiend at a total cost of £900,000. The conversion of the main line between Cape Town and Touws River (160 mi.) proceeded. (See also RAILROADS.)

(J. W. GR.)

**Electrification, Rural:** see RURAL ELECTRIFICATION.

**Electronics.** A method for controlling depth of anaesthesia in surgical operations was an important electronic development of 1950. It was accomplished by Reginald G. Bickford and Albert Faulconer, Jr., of the Mayo Clinic and Foundation at Rochester, Minn. Animal experiments showed that so-called "brain waves"—periodic electrical impulses produced in the brain that may be recorded on an electroencephalograph—undergo a characteristic change as anaesthesia deepens. At the lightest stage the total output of electrical energy from the brain, as measured by the height and duration of the recorded waves, is at a maximum. The energy output then progressively lessens until, at a level coinciding with respiratory paralysis, it becomes almost zero.

In the Mayo clinic device these changes were used to regulate the rate at which anaesthetic is administered to the patient. Electrodes on the scalp pick up the brain waves which are amplified in the electroencephalograph and make the usual record. Also connected to the device is an electronic integrator which stores the amplified energy from the patient's brain until it reaches a predetermined amount, then releases it, and the storage begins anew. The energy discharge at the end of each cycle triggers a relay, which activates a pump giving a definite amount of anaesthetic to the patient. Thus, when the brain is most active under light anaesthesia, the anaesthetic is administered most often. Its rate is reduced as anaesthesia becomes

more profound.

In a report on their work, presented late in the year, it was said that the new electronic method had been used successfully in operations on more than 50 adult patients, and that it was able to anticipate changes in the depth of anaesthesia many seconds before they would be apparent to a skilled anaesthesiologist, who ordinarily has to watch for certain reflexes and other muscular activity to judge the depth. It was pointed out, however, that the device did not replace the expert, who must still supervise its operation, but relieved him of much tedious work. It was said that safety devices were being developed to discontinue the anaesthetic automatically in case of an emergency such as surgical shock or failure of breathing. Another contemplated improvement was a control device by which the surgeon could directly regulate the depth of anaesthesia.

Another electronic control device announced during the year was one for regulating the exposure of low-altitude aerial photographs made from reconnaissance planes travelling at speeds of 600 m.p.h. or more. Because of quickly changing light conditions, very rapid adjustment of exposure is required, particularly when using colour film.

The new device, a development of George Bruck, John Higgins and John Ward, was first applied to a modified U.S. air force model S-7 camera with stereo lenses. This is a type in which the exposure is made by moving the film past a slit. The film is moved at such a rate, determined by the speed of the plane and its altitude, that its motion corresponds to that of the image. The adjustment for light conditions is made by changing the lens aperture. A third lens is used to pick up the light and focus it on a selenium photocell which, through an electronic circuit, adjusts the apertures of the taking lenses. A difference in illumination of as much as 40 to 1 is automatically compensated.

An electronic "umpire," indicating automatically the passage of a baseball through the "strike" zone and also giving its velocity, was developed by the General Electric company's Electronics laboratory and was used at the spring training camp of the Brooklyn Dodgers in 1950. At home plate is a shallow metal box, equipped with mirrors and lenses, from which three phototubes look at the sky through three slots in the top of the box. These make three planes in space, two vertical and one diagonal, forming a letter N and fencing in the strike zone. As the ball passes through these planes it casts on the slots a shadow which is recorded by the electronic circuits. Indication of a "strike" is given on a control box, connected by wires to the equipment at the plate. A light flashes if the baseball passes through the strike zone, and a meter shows the speed. If the light does not flash, a "ball" is indicated. If too high, or too low, the baseball penetrates the diagonal plane before or after it reaches the two vertical planes and the light does not flash, thus indicating a "ball." Similarly, a "ball" is shown by a failure of the light to flash if the baseball passes to the right or left of the planes. An adjustment can be made for the batter's height, making the strike zone correct for a short player as well as for a tall one.

A new type of photoelectric cell, called the phototransistor, eliminating the evacuated glass envelope of the usual type of phototube, was reported by the Bell Telephone laboratories. It represented an outgrowth of the transistor, which accomplishes many of the functions of a three-element electron tube and was announced by the same laboratories in 1949.

In the transistor, which is hardly bigger than the metal tip of a shoelace, two fine wires about two one-thousandths of an inch apart press against a small piece of the semiconducting metal germanium. Small electric currents flowing through one of the wires control the flow of a considerably larger current in the other wire, so the device can amplify faint signals. A change in light intensity can also control the flow of current. The photo-

transistor is about the size of a small-calibre rifle cartridge. It has a single collector wire touching a germanium wafer in the middle of a small dimple ground into the metal. The thickness at its centre is about three one-thousandths of an inch. Light is focused by a lens on the side of the wafer just opposite the tip of the wire to control the current.

Among new devices described at the sixth annual national Electronics conference held at Chicago, Ill., in Sept. 1950 was one which automatically measures water content in snow on mountainous areas, and reports its findings by radio to a central station. These measurements are important in regions such as California where melting snow provides water for power and irrigation. To assess available water it has been the practice to take actual snow samples in selected locations with long cylindrical tubes, then to weigh them to determine the water content. The new system, which was devised by R. W. Gerdel of the U.S. weather bureau, makes use of a small sample of radioactive material buried near the surface of the ground where measurement is to be made. Suspended above is a Geiger-Muller counter which responds to the radiation from the sample. As snow accumulates below the counter tube, the radiation is attenuated in proportion to the water content.

Impulses from the tube are coded into signals which may be transmitted over an automatic FM radio transmitter. To cover a large area, a number of such stations may feed their data into a repeater station. With several such repeaters, each with its outlying data transmitters, and all operating on a time-sharing basis, several hundred readings may be collected daily at the central receiving station, where the counts are all recorded.

An electron beam of the highest energy ever produced in open air, consisting of 70,000,000-v. electrons, was generated in the General Electric Research laboratory by Herbert C. Pollock. This was accomplished with a synchrotron, one of the new types of particle accelerator for atomic research, constructed as part of a project sponsored by the office of naval research. It had previously been used for the generation of 80,000,000-v. X-rays, though it had not before been possible to extract from within the doughnut-shaped vacuum tube the electrons that whirl around inside. Now this was done with two curved metal plates inside the tube, one charged to a high electrical potential. These divert electrons from their orbits and aim them at a thin foil window. They penetrate the air for many feet, and can be detected with photographic film or other devices sensitive to such radiation.

An electron beam, though in a vacuum rather than air, is used in the electron microscope. Like a light beam, it can be focused and used to form images. Because the effective wave length is much shorter than that of light, it shows much finer details, and hence the electron microscope is capable of far higher magnification than are microscopes using light rays.

Corresponding to the glass lenses which focus light waves in the common microscope are electron lenses which make use either of electrostatic or magnetic fields, properly shaped, to do the same thing for electrons. One of the most popular types of electron microscope employs magnetism, produced by electromagnets, which require an accurately controlled supply of power.

In a simplified electron microscope, developed by the RCA Victor division of the Radio Corporation of America and described to the National Electronics conference, permanent magnets are used to energize the magnetic lenses. The microscope is capable of forming an image magnified 6,000 diameters from the original. The electron micrograph can be enlarged further by photographic means, giving total magnification as high as 20,000 diameters.

Several new computing machines utilizing electronic methods were developed during the year. One of these, known as the elec-

tronic statistical machine and made by International Business Machines corporation, was used to analyze much of the data assembled in the 1950 census. The data were recorded on some 270,000,000 punched cards, one for each person, one for every home and at least eight for every farm.

In one operation, the electronic statistical machine classifies, counts, accumulates and edits, then prints the statistical data from groupings of information and balances the totals to check accuracy. If, for example, through some error a card should indicate that an eight-year-old boy was a war veteran, the machine would automatically reject the card.

There are two separate printing mechanisms which print on a single line not only the totals for each of 60 groups but also the grand totals. The group totals are automatically balanced against the grand totals as an accuracy check. The machine can count up to 10,000 units in each of the 60 different classifications, while sorting the cards into predetermined groups at the rate of 450 per minute.

At the national bureau of standards, Washington, D.C., was established a new computation laboratory, well provided with machines capable of solving problems in science, engineering and administration that would require a prohibitive amount of work with desk-machine methods. The principal machine at this laboratory was SEAC (standards eastern automatic computer). In its circuits are 1,050 electron tubes and 15,500 germanium diodes. These, related to the transistor described above, serve as two-element vacuum tubes to act as a one-way street for electrical currents. SEAC can add or subtract pairs of 11-digit numbers at the rate of 1,100 times per second, and can multiply or divide them at the rate of 330 times per second.

At the RCA laboratories near Princeton, N.J., Project "Typhoon" was completed. This was an electronic computer, built by the Radio Corporation of America for the U.S. navy's bureau of aeronautics. It was especially designed, under the direction of Arthur W. Vance, to evaluate performance of guided missiles, aircraft, ships and submarines and to aid in the air protection of U.S. cities. It was said to be capable of solving complex simulated problems of a complete guided missile system, which other computers had been unable to handle. Such solutions, it was stated, would permit the design of equipment with a minimum of experiments that might require the use of actual missiles, ships and aircraft.

The heart of "Typhoon" is a new type of electronic multiplier that blends the techniques of the analogue computer, similar in principle to a slide rule, and the digital apparatus, exemplified by the ordinary adding machine. In the new computer there are 4,000 electron tubes and several miles of intricate wiring. A solution of one typical problem, that of a hypothetical high-speed bomber successfully attacked by a radar-controlled, supersonic, rocket-propelled guided missile, involved 250 additions, 67 multiplications, 30 integrations and 20 aerodynamic functions, all of which were carried on simultaneously with continuously variable factors. Even to give an approximate answer, with a single solution for a minimum number of points, a mathematician and assistant would probably require six months. "Typhoon," in less than 60 sec., gave the continuous solution, for an infinite number of points.

Very high-frequency radio waves were found capable of improving the germination of carrot, beet, onion and tomato seeds by Herbert Jones of the University of California, Berkeley. He exposed the seeds to uniform electrical fields which caused the absorption of energy, some of which is converted into heat, in various points in the seed. The temperature of carrot seeds was raised to 108° F. and of onion seeds to 122° F. Germination of carrots was increased from 59% to 83% and of onions from 63% to 97%. Jones suggested that these methods, involving treat-

**ELECTRONIC PENCIL** for enabling blind persons to read print by translating each letter into a distinct sound heard by the blind person through a hearing aid. The instrument was developed by Vladimir Zworykin of the RCA laboratories and reported on in 1950

ments of only a few seconds for small quantities of seeds, might be adapted to large-scale operations, and that they might become important for agricultural regions with limited growing periods and early frosts during the germination of certain crops.

At Cornell university, Ithaca, N.Y., F. V. Kosikowsky, B. L. Herrington and A. C. Dahlberg found that cheese may be made bacteria-free by pasteurizing it with radio waves after the cheese has aged. Under existing methods, the milk is pasteurized before the cheese is made. They found it simpler to rid 10 lb. of cheese of bacteria by electronic means than to pasteurize the 100 lb. of fresh milk from which it is made. The method also makes it possible to pasteurize the cheese after it has been wrapped, a procedure which assures the consumer an uncontaminated product.

Radio waves, reflected from the trails of broken or ionized atoms left by a meteorite passing through the atmosphere at altitudes of from 56 mi. to 68 mi., make it possible to measure wind velocities at these heights, it was reported by L. A. Manning, O. G. Villard, Jr., and A. M. Peterson of Stanford university, Stanford, Calif. Such altitudes are well above those reached by sounding balloons, and while rockets reach them, they do not stay in one place long enough to get determinations of wind direction and velocity. The meteorite is a small particle of matter which enters the upper atmosphere from outer space and, after its passage through the rarefied air at considerable height, is completely burned and disappears in a flash of light commonly called a shooting star. It leaves behind, lasting for as much as several seconds, a line of ionized atoms, perhaps many miles in length and 1,000 times smaller in diameter. Such a trail acts as a reflector for radio waves sent out from a ground transmitting station.

Even though it is brief, the trail may have been moved appreciably by the winds aloft. Because of its motion, the frequency, in cycles per second, of the radio echo may differ somewhat from the original signal. By measuring this shift, caused by the Doppler effect, the Stanford scientists were able to deter-

mine the wind velocity and direction. One series of observations made in the summer of 1949 showed average velocities of 78 m.p.h., with motions from south-southwest and north the most common. The velocities found ranged from about 25 m.p.h. to 125 m.p.h. (See also STANDARDS, NATIONAL BUREAU OF.)

**Elizabeth**, PRINCESS, DUCHESS OF EDINBURGH (1926– ), the heiress-presumptive to the British throne, was born in London on April 21. She accompanied the king, queen and Princess Margaret on a state visit to the Union of South Africa in the early months of 1947, and celebrated her 21st birthday in Capetown. She was married to Prince Philip, duke of Edinburgh, on Nov. 20, 1947, and on Nov. 14, 1948, gave birth to a son, Prince Charles Philip Arthur George.

PRINCESS ELIZABETH (left) holding her two-month-old daughter, Princess Anne Elizabeth Alice Louise, after christening ceremonies for the infant princess at Buckingham palace, Oct. 21, 1950. Shown with her are, left to right: Queen Elizabeth, Prince Charles, Queen Mother Mary and the duke of Edinburgh (rear)

On Aug. 15, 1950, at Clarence house, London, Princess Elizabeth was safely delivered of a daughter who was christened Anne Elizabeth Alice Louise at Buckingham palace on Oct. 21. Princess Elizabeth flew to Malta on Nov. 25 to join the duke of Edinburgh, who was stationed there as first lieutenant in the destroyer "Chequers," and in December they paid an informal visit to Greece as guests of the king and queen of the Hellenes.

**Employment.** **United States.**—The total labour force in Aug. 1950 numbered 66,204,000, the highest figure reached during the year. This was an increase of slightly more than 1,000,000 persons from the Aug. 1949 figure of 65,105,000. Likewise, the civilian labour force (persons not in the armed forces and available for employment) was larger by 1,230,000 persons, numbering 64,867,000. Coupled with this growth in the labour force was a decrease in unemployment; the Aug. 1949 total of 3,689,000 unemployed decreased to 2,500,000 in Aug. 1950.

Table I.—Number of Employees in Nonagricultural Establishments, by Industry Division, United States\*

Industry division	(In thousands)			
	Aug. 1950	July 1950	June 1950	Aug. 1949
Total estimated employment . . . . .	44,939	44,062	43,952	42,994
Mining . . . . .	962	922	947	956
Contract construction . . . . .	2,589	2,524	2,416	2,340
Manufacturing . . . . .	15,385	14,763	14,667	14,114
Transportation and public utilities . . . . .	4,099	4,058	4,023	3,992
Trade . . . . .	9,426	9,374	9,414	9,213
Finance . . . . .	1,837	1,832	1,826	1,780
Service . . . . .	4,843	4,848	4,827	4,836
Government . . . . .	5,798	5,741	5,832	5,763

\*The estimates include all full- and part-time employees in private nonagricultural establishments who worked during, or received pay for, the pay period ending nearest the 15th of the month. Proprietors, self-employed persons, domestic servants and personnel of the armed forces are excluded. These employment series have been adjusted to levels indicated by social-insurance programs data for 1947 and have been carried forward from 1947 bench-mark levels.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review*.

Males in the labour force increased from 46,613,000 in Aug. 1949 to 47,132,000 in Aug. 1950—an increase of approximately 500,000 persons; 45,818,000 of these males were civilians of whom 44,154,000 were employed. The number of unemployed decreased from 2,519,000 in Aug. 1949 to 1,664,000 males in Aug. 1950.

Females in the labour force increased by 580,000 to 19,072,000 from Aug. 1949 to Aug. 1950. Nearly all, 19,049,000, were in the civilian labour force, only 23,000 being members of the armed forces; 836,000 were unemployed as compared with 1,170,000 12 mo. earlier.

In Aug. 1950 there were 44,939,000 employees in nonagricultural establishments, nearly 2,000,000 more than the 42,994,000 employees in Aug. 1949. Every division of nonagricultural employment showed an increase in this period (although some of the changes were rather negligible), reversing the general decline evidenced during the preceding year. The greatest changes occurred in manufacturing, contract construction and trade, where the increases numbered 1,271,000, 249,000 and 213,000,

Table II.—Number of Production Workers in Manufacturing, by Major Industry Group, United States

JOB APPLICANTS at an aircraft plant in San Diego, Calif., where hiring was stepped up in the summer of 1950 after the outbreak of war in Korea

respectively.

In the major manufacturing industries the general decrease in employment witnessed in the Aug. 1948 to Aug. 1949 period was also reversed. For the most part, employment increased in these industries with durable goods industries absorbing most of the additional employment. The primary metal, fabricated metal products, nonelectrical and electrical machinery, and transportation equipment industries were the leading gainers in employment. Among the nondurable goods industries textile-mill products had a sizable increase in employment during this period from Aug. 1949 to Aug. 1950.

The reversal of the 1949 decline in employment and pay rolls is further indicated by the indexes for these two items. For

Table III.—Indexes of Production Worker Employment and Weekly Pay Rolls in Manufacturing Industries\*

(1939 average = 100)

Period	Employment	Weekly Pay Roll
1941 (average)	132.8	164.9
1945	157.0	293.5
1946	147.8	271.1
1947	156.2	326.9
1948	155.2	351.4
1949	141.6	325.3
1950	144.7 (8 mo.)	343.9 (7 mo.)

\*Data have been adjusted to levels indicated by social-insurance programs for 1947 and have been carried forward from 1947 bench-mark levels.

Source: United States Bureau of Labor Statistics, *Monthly Labor Review*.

manufacturing industries the employment index averaged 144.7 for the first eight months of 1950 as compared with the 1949 value of 141.6. The weekly pay roll index for the same industries rose from 325.3 in 1949 to 343.9 for the first seven months of 1950.

The first figures for Sept. 1950 indicate a continuation in the same direction. Unemployment was at a 21-mo. low, numbering 2,300,000, while early September employment was at a record high for the season, reaching 61,300,000. The decline from the August employment figure was caused by the withdrawal of students from the labour force. This withdrawal, however, was not the main factor in reducing the number of persons listed as unemployed; this total declined primarily because of improved labour market conditions.

The major influence affecting employment and wage structures was the defense program, which was greatly expanded after the outbreak of war in Korea. By the close of the year there was already in evidence a noticeable tightening of the labour market.

With the automobile plants setting the pace, new wage increases continued through September and early October. Although such gains cut across all industry, the metal-working, textile, petroleum and maritime employees were the main beneficiaries. Many of the new union contracts had adopted the General Motors' agreement feature of tying changes in wages to the consumers' price index as determined by the bureau of labour statistics.

**Canada.**—The general employment index (1937=100) was 172.9 as of July 1, 1949, as compared with 171.6 for 1948. A preliminary figure as of July 1, 1950, was 175.0, an increase of approximately 2% from the year before. The Canadian index value for employment in manufacturing (1937=100) was 179 in 1949 and for the first seven months of 1950 averaged 176.3.

**Great Britain.**—The total working population of Great Britain (analogous to the labour force in the United States) increased by more than 100,000 persons to 23,325,000 by June 30, 1950, from its mid-1949 value of 23,194,000. This increase was confined to those in civil employment where the increase numbered nearly 200,000, the armed forces and women's services having decreased by 80,000 during the same period.

The major share of this increased employment was in the manufacturing industries. The employment figures for the basic industries remained relatively stable from mid-1949 to mid-1950, although there were slight decreases in the numbers employed in coal mining, fishing and agriculture. Among the other in-

dustrial groups, the distributive trades had 63,000 more employees by June 30, 1950, than a year before, and smaller increases were shown by the other groups excepting public administration which declined by 25,000.

**South Africa, Union of.**—The general employment index number (1937=100) for the Union of South Africa (excluding agriculture, commerce and the service) for 1949 was 134 as compared with 137.2 as an average for the first six months of 1950. Employment in manufacturing (1937=100) was at 161 for 1949 and 159.3 for the first six months of 1950.

**Australia.**—The general employment index (July 1939=100), excluding agriculture but including forestry, was 141 for 1949 and averaged 145.8 through June 1950. Employment in manufacturing was 162 for 1949 (1937=100) and 168.7 for the first six months of 1950.

**Chile.**—The manufacturing index (1937=100) for Chile was 138 for 1949 and averaged 141.3 for January through April of 1950.

**Norway.**—On the basis of an index excluding agriculture and commerce and including wage earners only (1941=100), the Norwegian employment index was at 109 for 1949 and averaged 109.5 for the first half of 1950. An industrial index (1948=100) was at 106 for 1949 and averaged 108.8 for the first six months of 1950.

**Switzerland.**—The index based on employment in manufacturing (1937=100) was at 127 for 1949 and for June 1950 was 122 as compared with 128 for June 1949.

**France.**—The general employment index for France (excluding agriculture) was at 109 for 1949 (1937=100). Using the same base year, employment in manufacturing had a level of 113. (See also BUSINESS REVIEW; CENSUS DATA, U.S.)

(P. TA.)

**Endocrinology.** One of the most cultivated fields of research during the year 1950 concerned the action of cortisone, an adrenal cortical hormone, and the adrenocorticotrophic factor of the anterior pituitary gland (ACTH) upon the signs, symptoms and ultimate course of rheumatoid arthritis and a number of acute and chronic diseases. Parallel investigations were concerned with the physiological and biochemical bases for the action of these hormones.

Clinical investigations indicated that these hormones do not affect the causes of the particular disorders which they alleviate, but rather affect the tissue reaction to the noxious agents. Thus, in rheumatoid arthritis cortisone controls the pain, stiffness, swelling of joints; *i.e.*, the phenomena of inflammation. However, the control usually lasts only as long as adequate daily amounts of the substance are given. Cessation of hormone administration is followed by a rapid return of all the signs and

symptoms; and the same joints are affected as were originally the seats of disease. In other words, the fire of rheumatoid arthritis is banked by the hormone, but embers remain to relight the conflagration when conditions are again favourable. In disease states of transient character (*e.g.*, acute attacks of rheumatic fever or certain allergic states) cortisone and ACTH seemingly effect a "cure" by shortening the attack. The beneficial clinical effects in disease are probably not the result of the gross metabolic actions of these hormones, since alleviation of signs and symptoms can be obtained in most cases without causing significant aberrations of metabolism. Furthermore, experience in certain inflammatory states of the eye and the skin demonstrated that local application of cortisone has just as beneficial an effect on the lesions as can be obtained by treating the whole person with the hormone.

In experimental animals, it was shown that cortisone inhibits the inflammatory reaction in tissues with respect to the growth and increase in number of connective tissue cells (fibroblasts) as observed under the microscope, and also prevents or limits the local increase in blood flowing through the area, as indicated grossly by redness and increase in local temperature. There was further evidence that the latter effect may be due to a direct involvement of cortisone in the constrictor mechanism of small blood vessels. Hence, this hormone may operate against the early blood vessel dilatation (hyperaemia) of inflammation, and thus minimize the total tissue reaction.

From these considerations it began to appear that, while cortisone could be of value in those conditions in which disability and pain resulted from an excessive inflammatory reaction, it had potentialities for harm in those conditions in which a vigorous inflammatory tissue response was essential for the protection of the total organism. This was demonstrated in rabbits pretreated with cortisone, and given a subcutaneous injection of a virulent culture of streptococci. The pretreatment abolished the intense local reaction seen in untreated control animals. However, the inhibition of the local tissue reaction permitted the bacteria to invade the general blood stream. The untreated rabbits were uncomfortable, suffered local damage, but survived. The treated animals were locally undamaged, but died of a generalized infection. Parallel experiences with spontaneous infections in man were reported. Thus, a potential hazard of ACTH or cortisone therapy is the possibility that while the patient is being successfully treated for one condition, an unrelated emergency (such as perforation of a duodenal ulcer or an acute appendicitis) may occur in such a modified form as to pass unrecognized until serious consequences have ensued.

**Pituitary-Hypothalamic Relationships.**—It had been known for many years that stimuli from the brain could lead to the release of one or another of the hormones of the anterior pituitary gland. However, the hypothalamus—that area of brain immediately adjacent to the pituitary—has little if any direct nerve connection to the anterior hypophysis. Hence, it was not clear how signals were transmitted from brain to gland. Subsequent investigations indicated that neural signals from the brain lead to the elaboration of certain chemical substances in the hypothalamus. These substances resemble adrenaline or acetylcholine or both and reach the anterior pituitary gland by means of a network of small blood vessels called the pituitary portal system. The transmitting system is, therefore, partly neural and partly humoral.

Many diverse stimuli had been demonstrated to cause release of ACTH from the anterior hypophysis. Some may come from the external environment (sudden temperature changes, physical injury, drugs, etc.); others originate in the body itself (fever, hormonal activities, anxiety states, etc.). The question arose as to whether all these different stimuli operated through the hypo-

thalamic pathway. During the year 1950 it became apparent, as crystallized in the review of W. V. McDermott, *et al.*, that the hypothalamus is by no means the only pathway for the stimulation of ACTH release. For example, the pituitary gland was removed from its normal site and transplanted to the outer chamber of the eye, thus severing the intimate connection between the gland and the midbrain. Nevertheless, the injection of histamine was followed by evidence of ACTH release. Adrenaline applied topically to the eye containing the pituitary transplant also led to ACTH release. It was, therefore, necessary to conclude that in some instances the signal can be conveyed directly via the blood stream to the pituitary without the intervention of the nervous system. However, such stimuli as cold and heat probably convey their messages via the brain, as shown by the interruption of the reaction under deep anaesthesia.

It had been thought by some that, whatever the pathway by which an internal or external stress eventually results in the release of ACTH, the secretion of adrenaline is a necessary intermediate step. This is apparently not so, for it was shown that certain stresses are capable of releasing ACTH in animals from whom the adrenal medullae have been previously extirpated.

Finally, it must be pointed out that all these mechanisms impinge upon an important regulatory system which depends upon the level of the adrenal cortical hormones in the circulating blood. When the level diminishes, more ACTH is released, which in turn stimulates the adrenal cortex to produce more of its hormones. When the level of adrenal cortical hormones in the blood is increased, the anterior pituitary is inhibited from secreting more ACTH. Under ordinary circumstances, this homeostatic mechanism serves to preserve a steady state despite continual demands arising from environmental stimuli. The work of 1950 made it evident that the activity of the important pituitary-adrenal axis can be modified according to "need" through a variety of pathways.

**Diabetogenic Influence of Growth Hormone.**—It had been shown previously that the administration of crude extracts of the anterior pituitary gland to normal animals will induce a severe diabetic state. On the other hand, the extirpation of the pituitary from a depancreatized animal will alleviate the severity of the diabetes. When it was subsequently found that certain steroid hormones from the adrenal cortex were also diabetogenic and that the extirpation of the adrenal glands would reduce the severity of experimental diabetes, it seemed possible that the diabetogenic factor in the anterior pituitary was ACTH. However, the reports of R. C. DeBodo, J. I. Campbell, B. A. Houssay, J. A. Russell and F. G. Young during 1950 indicated that (in addition to ACTH) the growth hormone of the anterior pituitary was a potent diabetogenic factor.

Many seeming paradoxes would have to be resolved before the diabetogenic and anti-insulin activity of growth hormone (GH) was understood. As part of its action in promoting growth, GH speeds up the synthesis of tissue proteins. But this occurs only when insulin is also present; in the absence of insulin GH leads to increased breakdown of protein. When insulin is present, a single injection of GH causes a lowering of the blood sugar level. On repeated injection, GH causes an increase in the blood sugar level and results in a state of resistance to the action of administered insulin. The long-continued administration of GH, under the appropriate conditions, leads to a degeneration of the insulin-producing cells of the pancreas and, thus, to the establishment of a permanent form of experimental diabetes. (See also ARTHRITIS; DIABETES; ZOOLOGY.)

**England:** see GREAT BRITAIN & NORTHERN IRELAND, UNITED KINGDOM OF.

**English Literature.** If in 1950 the stresses of an uneasy peace sometimes slowed the fluctuations of the imaginative impulse, they were not allowed to overcast completely the vigour and variety of English writings and opinions. Embedded in an output of thousands of volumes, the jewels had to be dug for; but how richly satisfying, for example, was the discovery of Freya Stark's *Traveller's Prelude*. Here, with an acute feeling for words and images, was a sensitively-woven narrative of her life—exhilarations and sadnesses, enthusiasms and frictions—up to the time when her travels in the east began. Here, too, was a marked individuality—a characteristic not lacking in the autobiographical field.

For instance, in his *Independent Member* Sir Alan Patrick Herbert ruminated in spirited and witty fashion on his former career as an M.P. for Oxford university, the ways of parliament and his love of London's river; while another outspoken individualist, Sir Alfred Munnings, the former president of the Royal academy, was content to confine his account of *An Artist's Life* to his first 40 years, recalling his youth in East Anglia and his early struggles as a painter. Wyndham Lewis's *Rude Assignment* was not so much concerned with personal experiences as with his work as writer and artist. Memorable portraits of painters, writers and musicians of the years between the wars formed the substance of *Noble Essences*, the fifth and final volume of Sir Osbert Sitwell's autobiographical series. The third volume of Herbert Hensley Henson's *Retrospect of an Unimportant Life* was concerned with the years of retirement, from 1939 to 1946, and included his revealing "Open Letter to a Young Padre"; while Sir Arthur Keith, who had his own declared views on man's origin and destiny, produced a detailed *Autobiography* engaging in its frankness.

Among the biographers Cecil Blanche Woodham Smith found an ideal subject in *Florence Nightingale, 1820-1910*. Authoritative, careful in its marshalling of facts and skilfully and sympa-

SCENE from T. S. Eliot's play *The Cocktail Party*, chosen in April 1950 by the N.Y. Drama Critics Circle as the best foreign play of the season, and also winner of a 1950 Antoinette Perry award

thetically written, this study kept in proper perspective the diverse phases in the life of a truly extraordinary woman. The first volume of an understanding life of *Monckton Milnes*, written by James Pope-Hennessy and based on Milnes's own papers, dealt with his life from 1809 to 1851. The *Journal of Mrs. Arbuthnot, 1820-1832*, edited by Francis Bamford and the seventh duke of Wellington, offered some illuminating comments on the politics and personalities of the period and made possible a better understanding of the first duke's character. The duke's victory at Waterloo provided one of the best chapters in Arthur Bryant's *The Age of Elegance, 1812-1832*, the third and final volume of his trilogy depicting the struggle against the French Revolution and Napoleon, and the state of Britain over a period of 30 years.

The still rich quarries of the 18th century were again worked over to some purpose and yielded James Boswell's *London Journal, 1762-1763*, a racy and uninhibited record of his stay in the city from the time he left Scotland on Nov. 15, 1762, until his departure for Utrecht in August of the following year. This was the first of a series of volumes to come from the lately discovered haul of Boswell papers kept in Yale university. Correspondence and documents which came to light only some 20 years before enabled Lord Herbert to issue *The Pembroke Papers, 1780-1794*, a further selection of extracts from the letters and diaries of the tenth Lord Pembroke and his circle; and Lord Ilchester in *Lord Hervey and His Friends, 1726-1738* included many of that chronicler's letters to the brothers Fox, afterwards Lords Ilchester and Holland. Stuart Piggott's biography of *William Stukeley* dwelt more on the serious achievements of that 18th-century antiquary than with his better-known amiable eccentricities.

British history through the centuries was surveyed by Keith Feiling's 1,600-page *History of England*; while in *A History of the English People* R. J. Mitchell and M. D. R. Leys concentrated mainly on social history from the Norman conquest onward. The structure of society in *The England of Elizabeth* was examined in the first volume of A. L. Rowse's new portrait of the Elizabethan age; and an account of the last days of mediaeval monasticism in western Europe, published posthumously, brought to a conclusion G. G. Coulton's learned four-volume study of *Five Centuries of Religion*.

Nichol Smith's *John Dryden* was concerned with the poet's early verse and criticisms, his plays, satires and religious poems, translations, odes and fables; and Dryden's prose and poetry were also estimated by C. V. Wedgwood in an excellent short survey of *Seventeenth Century English Literature*. Two literary centenaries—the death of William Wordsworth and the birth of Robert Louis Stevenson—were celebrated with a goodly muster of books about the central figure and reprints of his works. Among the Wordsworthiana Helen Darbishire's *The Poet Wordsworth* was the most satisfying appraisal; and Janet Adam Smith's scholarly edition of *Stevenson's Collected Poems* was in every way a tribute worthy of its occasion.

Aldous Huxley, Bertrand Russell (*q.v.*), George Orwell and Edward Sackville-West produced varied and thought-provoking groups of essays. The main paper in Huxley's *Themes and Variations* was devoted to the 19th-century French philosopher F. P. G. Maine de Biran, but there were others on the Baroque, El Greco and Piranesi and on overpopulation and soil erosion. Bertrand Russell, winner of a Nobel prize for literature, called his reflections on politics, philosophy and other matters *Unpopular Essays*. Political and literary themes provided the substance of Orwell's posthumous volume, *Shooting an Elephant*, though it also contained some light-weight pieces of journalism. *Inclinations*, a collection of literary studies, European as well as English, reflected E. Sackville-West's critical acumen and the wide range of his interests.

Among the war books that stood on their own merits as pieces

of writing were Winston Churchill's third volume of war memoirs, *The Grand Alliance*, which surveyed the year 1941; *Private Army*, Vladimir Peniakoff's account of the small independent unit he commanded so successfully in Africa and Europe, usually behind the enemy lines; and *The Fuel of the Fire* by Douglas Grant, who, in revealing what took place in one man's mind during his experience of war, showed himself the possessor of a sensitive intelligence and imagination and a style of writing out of the ordinary.

**Fiction.**—A literary event of the year was the publication of Rose Macaulay's first novel for a decade; but *The World My Wilderness* disappointed her admirers. In contrast William Cooper's *Scenes from Provincial Life* was artlessly true to experience. In another vein of satire Henry Green's *Nothing* was a chronicle of decadence.

Many so-called novels were more accurately high-grade thrillers, or largely—in the film phrase—"documentaries," or something of both. Typical of these were Mary Borden's *For the Record*, Robert Westerby's *An Awful Lot of Coffee* and Victor Canning's *A Forest of Eyes*. Also in 1950 it again was the fashion for writers to go slumming. Dennis Parry's *Fair House of Joy*, a supremely well-told tale of a doomed infatuation, attained pathos if not tragedy. Royston Morley in *The Desert in the Bed* dealt earnestly, if humourlessly, with the problem of the writer in society. Denton Welch's posthumous *A Voice through a Cloud* was a sensitive and evocative autobiographical record of suffering.

Evelyn Waugh wrote in *Helena* a life of the saint who was the mother of Constantine the Great and the reputed discoverer of the relics of the Cross. Margaret Kennedy's best-seller novel *The Feast* was a modern morality based on the seven deadly sins. The most distinguished work by a Catholic novelist was Bruce Marshall's *Every Man a Penny*, a memorable study in humility that showed deep understanding of the mind and soul of France.

In 1950 fewer writers offered, as short stories, fragmentary sketches and samples of "work in progress." P. G. Wodehouse's *Nothing Serious* proved him to be still a great and unique humorist. In *Mr. Midshipman Hornblower* C. S. Forester—one of the finest British fictional craftsmen—recounted early episodes in the life of his Nelsonian hero. William Sansom's tales in *The Passionate North* were slight, well-written and born of a sense of place. Angus Wilson's *Such Darling Dodos*, a portrait gallery of failures, confirmed his reputation as one of the best British writers of short stories.
